INTRODUCTION

A CONSIDERABLE *part of the work which made this seventh Book of the Year possible was done by John V. Dodge, assistant to the editor, before he was called to the service of his country in January 1944. The book was completed by those of us who could not be useful on the firing line, on the broad seas, on the bomb-shattered hills, muddy trails and dripping jungles of strange lands. The book will be distributed throughout those parts of the world where people are free to read whatever they wish and free to think as they please.*

It will stand as a testimonial to the great sacrifice and courage of those men and women who have, for the time being, been drawn into the insane conflict forced upon the world by small men who do not dare to allow people to read whatever they wish or to be free to think as they please.

The cruel circumstance growing out of enemy decadence, out of the cunning of political and diplomatic expedience, everywhere, in the year 1943, is reflected in this volume. The brave and good works of the John V. Dodges of this world are, however, the memorably significant record of the book, and it is this record which gives promise that the honesty and liberality of those rare men and women who helped create and perpetuate America's very special kind of democracy might again be recovered, for today, for tomorrow, not only for America but for anywhere, where happy families might hope to survive the arrogant domination of state and statesmen.

* * * *

The Book of the Year was made not only by its authoritative contributors, but by the checkers, the proofreaders, the young women of the working files; by Miss Wilma Morgan, who assembled the hundreds of illustrations; by Mrs. Ruth L. Breed, who made the necessary contacts with the Book of the Year's 500 contributors; and by Mrs. Mae H. MacKay, who, with her assistant, Mrs. Harriet Milburn, directed the work of more than 30 staff assistants to speed the articles to the rolling presses.

WALTER YUST

EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPÆDIA BRITANNICA AND OF THE BRITANNICA BOOK OF THE YEAR

JOHN V. DODGE, *Assistant Editor of the Book of the Year*

Estimated 500 U.S. bombers accompanied by equal number of escort planes delivered shattering attack on German port of Bremen.

Charges that U.S. was spending $6,000,000,000 on wasteful and unnecessary projects in South America were made in 176-page report to senate by Sen. Hugh A. Butler.

Gen. Eisenhower revealed that he had denounced Gen. Patton for striking shell-shocked U.S. soldier, but upheld retention of Patton in his command on grounds that latter was valuable and loyal.

Pres. Roosevelt, Prime Minister Churchill and Generalissimo Chiang Kai-shek completed five-day parley in Cairo and drafted specific program designed to (1) strip Japan of all her possessions gained since 1914, (2) restore to China all of her territory seized by Japan, (3) grant independence to Korea, (4) expel Japan from all territory acquired by "violence and greed," and (5) compel Japan to surrender unconditionally.

27 **Devastated Berlin** was raided for fifth night in row by R.A.F. formations which unloosed 1,000 tons on German capital.

WMC was charged by OWI Director Elmer Davis with creating "public confusion" by withholding and concealing news.

Declaration of state of belligerency between Colombia and Germany was approved by Colombian senate.

28 **German defenses across Sangro river** in Italy were pierced by British 8th army's drive.

29 **Thirteen U.S. bombers** and 16 fighters failed to re-

NOVEMBER—*Continued*

turn from third big November raid on German port of Bremen.

Japanese supply base of Bonga on northeastern New Guinea coast was occupied by Australian forces.

30 **King Victor Emmanuel** was shorn of his titles as king of Albania and emperor of Ethiopia by Badoglio government.

Lt. Gen. Alexander A. Vandegrift was named to succeed Lt. Gen. Thomas Holcomb as commandant of U.S. marine corps, as of Jan. 1, 1944.

DECEMBER

1 **Pres. Roosevelt, Premier Stalin and Prime Minister Churchill** completed four-day conference in Teheran and reached complete agreement on measures to destroy German military power and to set up enduring postwar peace organization.

Industrial centre of Solingen in Germany was bombed for second day in row by U.S. four-engined planes.

Moscow admitted retreating Russian armies had evacuated Korosten.

Swedish exchange liner "Gripsholm" arrived in New York with 1,439 Americans and Canadians released from Japanese internment camps.

Total U.S. casualties incurred in Gilbert Islands invasion were 3,772; 1,026 marines were killed and 2,557 wounded in Tarawa battle.

2 **Britain was urged** by Prime Minister Jan Christiaan Smuts of South Africa to bolster her position in Europe lest she become a weak and unequal partner with U.S. and U.S.S.R.

More than 500 R.A.F. bombers broke through strong enemy fighter plane and anti-aircraft defenses to rain 1,680 short tons of explosives on Berlin, leaving fires visible 200 mi. away.

Seventeen Allied ships were sunk and 1,000 casualties were suffered in surprise German air attack on Allied merchantmen in Italian port of Bari.

3 **WPB announced 8,789 planes,** including more than 1,000 four-engined bombers, were produced by U.S. aircraft factories in Nov. 1943.

Allied 5th army bent back German lines over Mount Camino range after 72 hours of fierce battle in drive toward Rome.

4 **R.A.F. bomber formations** tricked Germans by feinting attack on Berlin, then swooping on Leipzig to batter that city with 1,680-short-ton salvo of explosives.

Yugoslav partisans announced they had set up provisional regime in opposition to Yugoslav government-in-exile sitting in Cairo.

U.S. shipyards delivered 25,284,287 tons of merchant shipping between Jan. 1 and Dec. 1, 1943, exceeding 24,000,000-ton goal set for year, Adm. Vickery announced.

Bolivia's declaration of war against axis nations, approved by Bolivian congress on Nov. 26, was formally disclosed.

Two Japanese cruisers, four other ships and 72 planes were destroyed by U.S. task force in raid on Marshall Islands.

Japanese-held Nauru Island was severely bombed and shelled by U.S. carrier planes and warships.

6 **Turkey edged closer** to camp of United Nations as President Inönü conferred with Pres. Roosevelt and Prime Minister Churchill for three days in Cairo.

7 **OWM Director Byrnes** warned that failure to retain food subsidies would lead to widespread inflation and result in hardships to people with fixed incomes.

8 **Wareo junction** fell to Australian troops driving westward along New Guinea coast.

9 **Chinese forces recaptured Changteh** in vigorous counterattack and pressed drive to expel Japanese from "rice bowl" area.

Znamenka, German-held rail centre southwest of Kremenchug, was captured by Russians.

Senate overruled Director of Economic Stabilization Vinson and approved by 74-to-4 vote pay increase of 8 cents per hour for nonoperating railroad employees.

Joint Allied statement asserted that more U-boats than Allied merchantmen were sunk in Nov. 1943.

Sec'y Hull announced that U.S. would aid Gen. Josep Brozovitch (Tito) and his Yugoslav partisan forces as well as Gen. Mikhailovitch.

10 **Sofia was heavily bombed** by Allied warplanes.

House foreign affairs committee was told by Breckinridge Long, U.S. assistant secretary of state, in secret session, that 580,000 victims of Hitler persecution had been admitted to U.S. in 10 years.

Pres. Roosevelt signed bill placing pre-Pearl Harbor fathers at bottom of draft list, overruling WMC Chairman Paul McNutt, who objected that measure would sabotage U.S. manpower program.

11 **Hungary, Rumania and Bulgaria** were solemnly warned by Sec'y Hull to quit war or suffer consequences.

138 nazi fighter planes were shot down trying to intercept U.S. bombers, escorted by combat planes, that staged paralyzing aerial attack on German U-boat base of Emden.

12 **German counteroffensive in Kiev area** was halted by Russian troops.

Russo-Czech treaty of friendship and mutual assistance was signed in Moscow by Foreign Commissar Molotov and Czech Ambassador Zdenek Fierlinger as Pres. Eduard Beneš witnessed ceremony.

Sec'y Stimson and Sec'y Knox stressed U.S. army-navy regulations did not ban officers from accepting "draft" nomination for president.

13 **Swiss dispatches** described nazi secret weapon as 12-ton rocket shell with range of 160 mi. to be fired from French coast over England.

14 **Axis airfields in Greece** and merchant ships in Piraeus harbour were attacked by 300 U.S. planes.

Load of 356 tons of explosives was dropped by more than 100 U.S. bombers on small Japanese-held port of Arawe.

Fall of Cherkassy to soviet troops was announced in Moscow communiqué.

15 **Five railroad operating brotherhoods** announced they would go on strike Dec. 30 because their demands for 30% pay increases were not met.

U.S. forces landed at Arawe on New Britain Island in new Pacific offensive designed to neutralize Japanese air base of Rabaul.

16 **British government** announced that Prime Minister Churchill was ill of pneumonia somewhere in middle east.

Safe return of Pres. Roosevelt to U.S. after conferences in middle east was announced by White House.

Berlin was aglow with many fires after R.A.F. bombers showered battered German capital with 1,680 short tons of explosives.

18 **Three German soldiers** and one Russian were sentenced to hang after they were found guilty by a Kharkov military tribunal of participating in mass slayings of Russian prisoners and civilians.

San Pietro in Fine fell to Allied 5th army in Italy after 72 hours of bitter battle.

19 **Large formations of U.S. bombers** attached to U.S. 15th air force accomplished "heavy and accurate" bombings of military objectives in Augsburg, Germany and Innsbruck, Austria.

20 **New drive against German base of Vitebsk** was opened by Russian armies, Moscow announced.

DECEMBER—*Continued*

Bombers of U.S. 8th air force struck Bremen with 1,200 tons of bombs.

Bolivian government of Pres. Peñaranda was overthrown in military coup and replaced by five-man junta.

Moscow radio announced that "The Internationale" would be replaced by new soviet anthem.

More than 2,250 tons of bombs were cascaded over Frankfurt by estimated 800-900 R.A.F. four-motored planes in one of heaviest raids of 1943, on German chemical and arms centre; R.A.F. bombers also battered Mannheim-Ludwigshafen industrial targets.

21 U.S. army headquarters in Central Pacific disclosed that Gen. Marshall had toured Pacific battle areas and had conferred with Gen. MacArthur.

Japanese air strip at Arawe was captured by troops of U.S. 6th army in New Britain, Allied communiqué announced.

Pierre-Étienne Flandin, Marcel Peyrouton, Pierre Boisson and two other Frenchmen suspected of Vichyite tendencies were arrested on treason charges by French Committee of National Liberation.

22 Thirty-eight German planes and 21 U.S. bombers were shot down during U.S. bombing raids over northwest Germany.

Yugoslav partisan government forbade King Peter to return to homeland during war and deprived his government of all rights.

Seven men accused of conspiring to extort $1,000,000 from motion picture industry were found guilty by New York federal court jury.

Mgr. Bernard W. Griffin was appointed archbishop of Westminster.

German foreign office hinted that reprisals would be taken against U.S. and British prisoners of war in Germany because Russians executed three German soldiers accused of wanton slayings.

23 Pres. Roosevelt suggested dropping "New Deal" label for his administration in favour of "Win the War" slogan.

U.S. war department revealed that 346 of 581 bomber crewmen whose planes were shot down over Germany during Schweinfurt raid were alive and prisoners of war.

Yugoslav partisan government was labelled as "work of impostors" by Yugoslav regime representing King Peter.

Premier Raid Soli told Lebanese chamber of deputies that France had agreed to give up her mandated controls over Syria and Lebanon on Jan. 1, 1944.

24 Gen. Eisenhower was named to command Allied armies slated to invade western Europe; Lt. Gen. Spaatz was appointed overall commander of U.S. strategic bombing air force operating against reich; Gen. Montgomery was appointed to lead British troops under Eisenhower; Gen. Sir Henry Maitland Wilson was picked to succeed Eisenhower as Allied commander in Mediterranean theatre of operations; and Gen. Alexander was named commander of all Allied forces in Italy.

Pres. Roosevelt declared in Christmas eve broadcast that "Big Four"—U.S., Britain, U.S.S.R. and China—were agreed to use force "for as long as may be necessary," to maintain post-war peace.

Pope Pius XII urged world leaders to shun hatred and vengeance and pleaded for just peace maintained by employment of force if necessary.

"Rocket coast" of France was smashed by estimated 3,000 Allied warplanes in attacks on "special military installations."

Tempelhof area of Berlin was systematically bombed by R.A.F. squadrons which unloosed 1,120 tons of bombs on reich capital.

Gorodok, fortified town protecting German-held Vitebsk 17 mi. away, fell to advancing Russian troops.

Two railway brotherhoods numbering 230,000 members agreed to arbitration by Pres. Roosevelt and called off scheduled strike.

Thirty Japanese planes were shot down by Allied pilots, in air battle over Rabaul, Allied headquarters announced.

25 German supply route linking Vitebsk and Polotsk was cut by Russian armies.

Deadlock between plant operators and C.I.O. steelworkers on latter's demands for pay boosts led to walkout of 70,000 steelworkers in four states.

26 26,000-ton German battleship "Scharnhorst" was sunk off North Cape, Norway, after running battle with British warships.

27 15,000 Germans were killed as Russia's 1st Ukrainian army rolled back nazi forces 25 mi. on a front 50 mi. wide, Moscow communiqué announced.

Pres. Roosevelt ordered Sec'y Stimson to seize all U.S. railroads and put them under army rule in move to thwart strike threat.

Fair Employment Practice committee called on Pres. Roosevelt to compel 16 southeast railroads and seven unions to cease discrimination in employment of Negroes.

Allied headquarters announced that U.S. marines had landed at two points around Cape Gloucester, New Britain Island.

Prediction that Allies would win European war in 1944 was made by Gen. Eisenhower.

Appointment of Air Chief Marshal Sir Arthur Tedder as deputy supreme commander of Allied invasion army under Gen. Eisenhower was announced by British government, which also revealed that Gen. Sir Bernard Paget had been named commander-in-chief in middle east under Gen. Sir Henry Maitland Wilson.

28 Majority of 170,000 striking steelworkers returned to jobs after WLB approved Pres. Roosevelt's suggestions that retroactive pay be guaranteed.

Maj. Gen. Doolittle was named to command U.S. 8th air force in England; Lt. Gen. Devers was appointed commander of all U.S. forces in Mediterranean; Lt. Gen. Eaker was named to command all Allied air forces in Mediterranean and Gen. Nathan F. Twining was named commander of U.S. 15th air force in Mediterranean.

29 Korosten, Ukraine rail hub, was recaptured by Gen. Nikolai Vatutin's 1st Ukrainian army.

Berlin reeled under weight of 2,240 tons of explosives dropped by great swarm of R.A.F. heavy bombers.

Canadians occupied Ortona in Italy after nine days of house-to-house fighting.

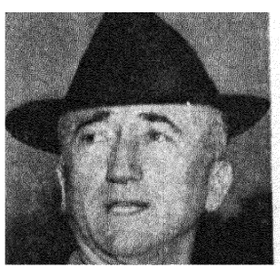
Adm. Sir Bertram Ramsay and Air Chief Marshal Trafford L. Leigh-Mallory were named naval and air chiefs respectively under Gen. Eisenhower.

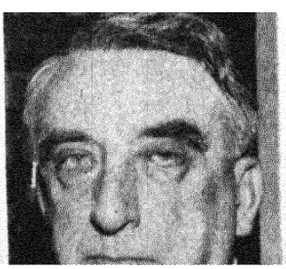
Scheduled walkout of U.S. railway workers averted as last of three brotherhoods cancelled strike orders.

30 Russian armies in Ukraine routed 22 German divisions and swarmed through broken nazi lines on 186-mi. front.

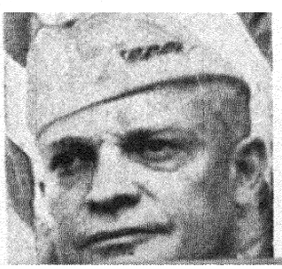
More than 1,300 U.S. bombers and fighters smashed targets in southwest Germany.

Cape Gloucester aerodrome on New Britain Island fell to U.S. marines who captured both of Japanese-held landing strips after 48 hours of battle.

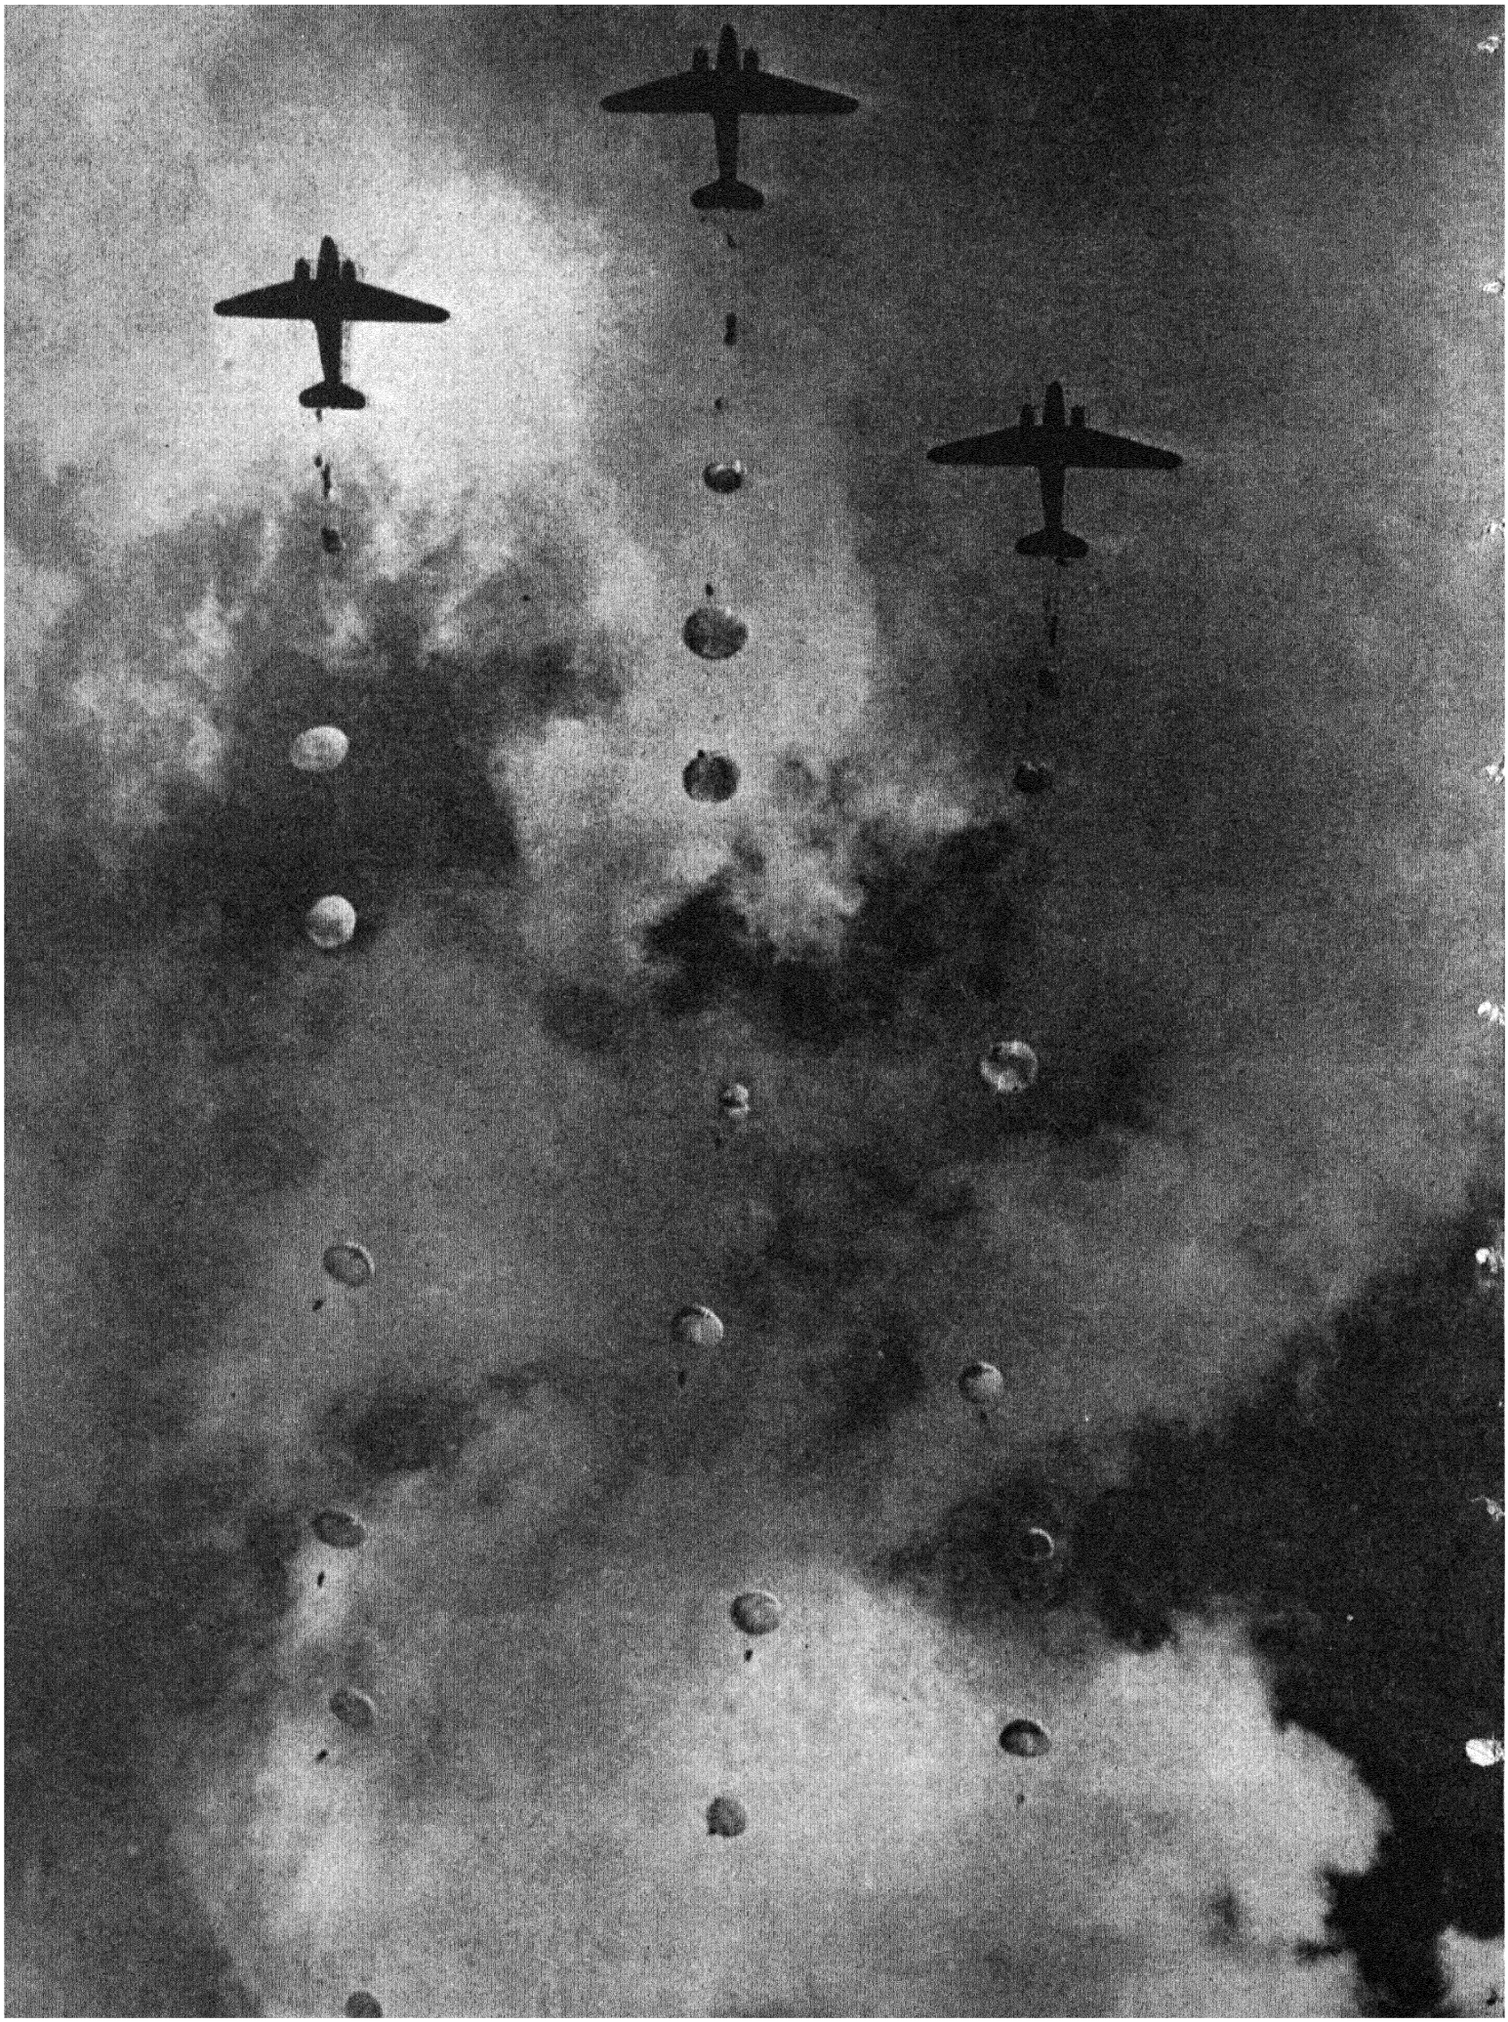




31 Zhitomir was recaptured by Russian armies in powerful drive toward Polish frontier.



Adolf Hitler warned that there would be "no victors or losers, but merely survivors and annihilated" in World War II.



All political parties in Argentina were ordered dissolved by government decree.

BYRNES	Dec. 7
VINSON	Dec. 9
PEYROUTON	Dec. 21
EISENHOWER	Dec. 24
SPAATZ	Dec. 24

Abd-el-Aziz-IV (1878–1943), sultan of Morocco, was born Feb. 24 in Marrakesh, Morocco. After his father's death in 1894, he became nominal head of the government with real power vested in his chamberlain, Si Ahmed-ben-Musa. After the latter's death in 1900, the young sultan ruled until 1908, when recurrent local revolts forced him to abdicate. He died in Tetuan, Spanish Morocco, June 9. (See *Encyclopædia Britannica.*)

Aberhart, William (1878–1943), Canadian politician, was born Dec. 30 on a farm near Kippen, Ont. After studying at Hamilton Normal school and Queen's university, he settled in Calgary, where he organized a Bible class that later expanded into the Calgary Prophetic institute. He became widely known for his religious broadcasts made in behalf of the institute. In 1935, he took over the premiership of Alberta as head of the Social Credit party, which promised monthly dividends of $25 for every man and woman; in the elections that year his party won 56 of the 63 seats in the Alberta legislature. Aberhart's program was based on the theories of social credit propounded in London by Major C. H. Douglas. Later, provincial and dominion courts and the privy council ruled his legislation unconstitutional, and in 1938 he set up a modified form of social credit. Aberhart was re-elected in 1940. He died in Vancouver, B.C., May 23, 1943.

Abrasives. Such data as were received in 1943 are abstracted as in the accompanying table.

Corundum.—It is possible that a moderate domestic supply might be developed following investigations of deposits in the United States, mostly in the southern Atlantic coast states.

Diamonds.—Demand continued high, but no information was made public on supplies. (*See* under DIAMONDS.)

Emery.—The area around Peekskill, N.Y. turned out the largest emery output since 1918.

Flint.—Sales of grinding pebbles increased from 13,561 tons in 1941 to 15,487 tons in 1942, while tube-mill liners dropped from 3,411 tons to 2,576 tons.

United States Production of Abrasives
(In short tons, or as indicated)

	1939	1940	1941	1942

Metallic abrasives†	42,015	50,016	86,309	125,264

*Imports; no domestic production. †Includes Canada also. ‡Jan.-Sept. only.

Garnet.—Sales declined in 1942, but were still well above the 1939 level.

Grindstones, Pulpstones and Millstones.—Sales of grindstones were increased 41% in quantity in 1942, but declined 3% in value, while pulpstones decreased in quantity but increased slightly in value. The value of millstones sold declined by one-third.

Pumice.—Sales of pumice made a new record high, with an increase of 11% over 1941.

Sharpening Stones.—Sales increased in 1942, but no data were published. (G. A. Ro.)

Accident Insurance: *see* INSURANCE.

Accidents.

Accidents throughout the United States during 1943 dropped 1.5% from 1942. Estimates for the year indicated 94,500 accidental deaths and about 9,000,000 disabling injuries.

The greatest reduction was in motor vehicle accidents, where deaths dropped 18%. (See *Traffic Accidents and Accident Prevention,* below.) Fatal accidents in industry decreased 3%. Home fatalities, on the contrary, showed a rise of 5% and there was a 3% advance in public accident deaths not involving motor vehicles.

The National Safety council estimated that 1943 accident losses, as measured in actual time off and in permanent disabilities and deaths, were the equivalent of 380,000,000 man-days of production.

Accident reductions from 1942, although not large, reflected a considerable measure of success in safety, because there were many circumstances tending toward increased accident totals. Only in the field of traffic did the exposure to accidents decrease. Here a reduction in motor vehicle mileage of 21% approximately equalled the drop in motor vehicle accidents.

The decline in industrial accidents was achieved in the face of increasing industrial employment, including large groups of inexperienced workers operating in unfamiliar trades.

The accident toll would undoubtedly have been much higher in 1943 except for the greatly increased attention given to safety by organizations and individuals throughout the United States. This interest was reflected in many ways: the inauguration or improvement of safety programs in war industries; the adoption of safety as an activity by numerous industrial, civic and service associations; greatly expanded use of safety educational material by newspapers, magazines and the radio.

Industry realized more clearly in 1943 that accident prevention was a "round-the-clock" problem, and that a worker hurt in an off-the-job accident was just as surely an industrial casualty as if he had been hurt at his machine. Consequently, industrial leaders undertook to educate employees in traffic and home accident prevention, through educational literature and other means.

The outstanding safety event of 1943 was the National Safety congress held in Chicago in October. This gathering included some 10,000 delegates, who came from every state in the union and represented every phase of the safety movement. There were 175 sessions held during the three-day convention, and more than 500 safety experts participated.

PLASTIC SHIELD to protect the faces of U.S. aircraft workers

Many units of the armed services developed and carried out extensive programs of safety among their personnel. Responsibility for such programs was commonly placed in the hands of men drawn from industry and from public agencies, with a background of many years' experience in industrial and traffic safety. (*See* also DEATH STATISTICS; DISASTERS; INDUSTRIAL HEALTH.) (R. L. Fo.)

Traffic Accidents and Accident Prevention.—The year 1943 was marked by an increasing emphasis on the training of drivers —for purposes of accident prevention and in order to help fill the army's needs—and on making preparations in the fields of highway engineering and traffic law enforcement for the post-war period when the yearly traffic toll was expected to approach, if not exceed, the alarming all-time high mark of 40,000 reached in 1941. The total of 23,300 deaths in 1943 was 18% less than in 1942, and 42% less than in 1941, when the nation's traffic death toll reached an all-time high. In addition to the fatalities, 1943 traffic accidents resulted in 800,000 nonfatal injuries, 60,000 of which left some permanent impairment.

A valuable impetus to the driver education movement was given during 1943 when the U.S. army made a request that pre-induction driver education courses be set up in the high schools of the country. With the lowering of the induction age to 18 years and the corresponding increase in the flow into the army of young men with no civilian job experience useful from a military point of view, the problem of army training was considerably accentuated.

The war department and the U.S. office of education prepared teaching materials in the field of driver education as adapted to army needs, and these materials were distributed to a large number of high schools

Four training institutes for state driver education leaders were held during the summer of 1943. The driver education program was carried on actively in 22 states, and more than 7,000 high schools signified their intention of including pre-induction driver education in their curricula.

Three staff members of the New York University Center for Safety Education and one staff member each from the National

Conservation bureau, the National Safety council and the American Automobile association devoted considerable time to instruction in connection with the driver training work.

Consultant services on the establishment of driver education courses were provided by war department representatives and by pre-induction training officers stationed in the service commands.

There was an intensification of traffic during 1943 in war production centres and in the vicinity of military posts, and as a result both military and civilian authorities devoted a great deal of attention to the matter of preventing traffic accidents as one phase of the over-all program to conserve essential manpower and vitally needed equipment and materials. Plans for maintaining close liaison in solving the critical traffic problems in areas where much of the highway travel was of emergency character were developed at meetings held in all of the service commands under the joint sponsorship of the army and the Highway Traffic Advisory committee to the war department. Discussions emphasized the need for closer co-ordination of the traffic control efforts of military and state officials.

In four cities—Norfolk, Va., Seattle, Wash., Charleston, S.C., and Baltimore, Md.—which were among those designated by the army transportation corps as being in greatest need of traffic control assistance, the Safety division of the International Association of Chiefs of Police made extensive traffic control surveys which were followed by detailed recommendations dealing with the traffic problem and the procedure for facilitating traffic flow and preventing accidents.

The need for more men for the fighting fronts put an increasingly heavier drain on police manpower during 1943, and in the field of traffic control and accident prevention this had serious effects. Trained men were badly needed to take the place of those who had gone into the armed services. The training of traffic enforcement personnel was continued as a means of meeting an immediate situation and of planning for the postwar period.

The Northwestern University Traffic institute, leading training agency for traffic police, conducted two four-month courses in traffic police administration as the major feature of its training program, and in addition held two short courses (of two weeks each) on the Northwestern campus and assisted in traffic training work in a number of police departments and at several colleges throughout the country.

Eleven organizations co-operated in sponsoring the sixth National Institute for Wartime Traffic Training from June 21 to July 2, 1943, at Ohio State university in Columbus. The eleven organizations were: the National Conservation bureau, the American Automobile association, the International Association of Chiefs of Police, the Automotive Safety foundation, the National Safety council, the American Association of Motor Vehicle Administrators, Northwestern University Traffic institute, the Yale University Bureau for Street Traffic Research, the American Association of State Highway Officials, the Institute of Traffic Engineers and Ohio State university.

Progress was made during 1943 in the construction of express highways designed to speed traffic movement and to help prevent accidents. The Defense Highway act of 1941, through which funds had been made available for a number of important highway projects either completed or under construction, also set the stage for the building of more than 1,000 mi. of expressways in and around metropolitan areas in the immediate postwar period.

During 1943 the Willow Run bomber plant near Detroit, the war department's Pentagon building near Washington, D.C., and an ordnance plant near Denver obtained expressway connections under this act. The Ramona freeway in Los Angeles and a Pittsburgh downtown expressway belt also progressed substantially toward completion in 1943.

Deaths from Accidents in the U.S., 1943 and 1942

	1943	1942	Change
All accidents	94,500	95,880	—1.5%
Motor vehicle*	23,300	28,300	—18.0%
Public, civilian (except motor vehicle)	15,500	15,000	+3.0%
Home, civilian	33,000	31,500	+5.0%
Occupational, civilian	18,000	18,500	—3.0%
Military personnel	9,500	6,600	+44.0%

*The motor vehicle death totals include some deaths also included in occupational, home and military personnel. This duplication amounted to about 4,800 deaths in 1943 and 4,000 in 1942.

The 1942 all-accident and motor vehicle totals are U.S. census bureau figures. All others are National Safety council estimates.

Five state legislatures adopted limited-access highway legislation in 1943 permitting construction of expressways. This brought the total number of states with such enactments to 17.

The year saw the expansion of programs for staggered working hours and group riding which helped to conserve essential highway transportation for the war effort. With more people per car riding to and from war plants, the need for preventing traffic accidents to save the lives of and to avoid injuries to war workers became more urgent than ever before. (R. E. RII.)

Acheson, Dean Gooderham (1893–), U.S. government official, was born in April in Middletown, Conn. He graduated from Yale university, 1915, and received a law degree from Harvard three years later. He served as a naval ensign in World War I, and later became private secretary to Louis D. Brandeis, associate justice of the U.S. supreme court. In 1921, he entered the private practice of law, which he followed until May 19, 1933, when he was appointed undersecretary of the treasury. This appointment terminated with his resignation later that year, when he returned to his law practice. He continued his work as attorney until Feb. 1, 1941, when he received an appointment as assistant secretary of state. With the formation of the United Nations Relief and Rehabilitation administration in 1943, Acheson was chosen as the U.S. member of the UNRRA council. He delivered the opening address before the assemblage of international delegates which met at Atlantic City in Nov. 1943.

Aden. Aden is a British colony, seaport and territory in southwest Arabia, situated in 12° 47′ N. and 45° 10′ E., including Perim island in the strait of Bab-el-Mandeb between Africa and Arabia; area 80 sq.mi.; pop. (est. 1939) 48,338. Aden protectorate, including Socotra in the Indian ocean, 112,000 sq.mi.; pop. (est.) 600,000. Governor (1943): Sir J. Hathorn Hall. Language: English and Arabic; religion: predominantly Mohammedan.

History.—With the end of axis resistance in Africa and the subsequent surrender of Italy in 1943 the war receded from Aden, although conditions created by the war still continued to engage the active attention of the government. In the early part of 1943 the almost complete failure of the spring rains in the protectorate was the cause of grave concern, and it soon became apparent that a serious shortage of foodstuffs would result. Prompt action by the Aden government, assisted by the middle east supply centre and financed by the British government, resulted in the early amelioration of conditions.

The development of the Audali plateau, at a height of approximately 7,000 ft., as a market garden for the town of Aden during the summer months received great impetus during 1943 and provided additional supplies of fresh vegetables and potatoes during the hot season.

From the beginning of the war until the end of Nov. 1943 the

people of Aden made monetary contributions to the prosecution of the war and to war charities amounting to approximately £73,000, a particularly generous response in view of the small population. In addition, up to June 1943 the government of Aden had lent to his majesty's government, free of interest, the sum of £105,000. (L. T. S.)

Finance.—Revenue (1941–42) Rs.46,71,758; expenditure (1941–42) Rs.39,53,932; currency, legal tender rupee: (Rs.1) = 1*s.* 6*d.*, or approximately 30 cents U.S. in 1943. Rs.100,000 = 1 lakh, written Rs.1,00,000; Rs.10,000,000 = 1 crore = 100 lakhs, written Rs.1,00,00,000.

Trade and Communication.—External trade 1939 (merchandise and treasure on private account): imports, by sea Rs.5,78,56,697; by land Rs.22,76,258; exports, by sea Rs.3,37,72,025; by land Rs.22,11,555; (treasure) imports Rs.37,00,871; exports Rs.20,22,690. Communications: shipping (1939) 2,004 merchant vessels (1,300 British) entered, total tonnage 8,005,763 net tons; motor vehicles registered (Sept. 30, 1939) 733 cars and taxis, 207 commercial vehicles.

Production.—In 1938–39, tobacco (approx. value of crop) Rs.500,000; salt 282,994 tons; (export) 248,784 tons; coffee (export) 5,401.27 short tons.

Advertising.

United States.—During 1943, the United States' second year of World War II, the rapid expansion of war demands on manpower and production had a telling effect on business and hence upon advertising. Greatest single factor, perhaps, was the shortage of paper and printing materials. By the end of 1943 a War Production board edict had cut paper supply to publishing and printing industries to 75% of normal consumption. Newspaper publishers experimented with lightweight stock to stretch quotas.

In spite of shortages, volume of advertising increased greatly. Although profits were higher, they were largely absorbed by excess profit taxes. Both institutional and industrial advertising increased tremendously. In the United States, advertising expenditures were $2,100,000,000 as compared with $1,820,000,000 in 1942, an increase of 15%. Newspaper linage increased 12.5%. Dollar volume of magazine advertising increased 30%; radio increased 32.3%; farm paper advertising increased 39.9%; outdoor decreased 5.6%; direct mail increased 8.3%.[1]

It was estimated by the war advertising council that more than $300,000,000 in space had been contributed for the promotion of war themes. Nearly 100 separate home-front information campaigns on food, manpower conservation, finance, United States army, housing, Red Cross and bond drives were conducted in co-operation with the Office of War Information and 17 other major government departments.

A survey conducted by the American Marketing association showed that 86% of management and advertising executives believed business had a responsibility in disseminating information to the home front, expressing a strong preference for voluntary contributions of advertising space and time, rather than appropriation of government funds for this purpose.

To conserve natural resources, the War Production board ordered in September a national brown-out which replaced the general black-out regulation in coastal cities. This permitted advertisers to operate outdoor and indoor displays and show windows between dusk and 10 P.M., with the exception of places of public service while they were open for business.

Copy and Layout.—Most significant change in copy was a distinct improvement in the tone of war advertising and in the quality of appeal. Much of the copy became more realistic and informative. Advertising became aware of public and government sentiment against commercializing patriotism in print and boasts of contributions toward winning the war and took steps to eliminate such criticisms. Postwar themes were used extensively. Toward the end of 1943, the war was mentioned less frequently.

Magazines.—In spite of rationing of paper, magazines as a whole carried the largest advertising volume in their history—105 magazines grossed $227,000,000 as compared with $174,582,984 in 1942 and $196,687,538 in 1929. An additional $50,000,000 worth was refused because of paper shortage. (*See* NEWSPAPERS AND MAGAZINES.)

Ten publishers, including *Newsweek, Life* and the *New Yorker,* put out and distributed free of charge miniature editions for servicemen overseas. They carried substantially the same editorial matter but no advertising.

Newspapers.—Efforts to tighten classified sections, editorial columns and the like had been exhausted by the end of 1943 and the next move was toward curtailment of local retail and national advertising. Some papers adopted a 1,000-line ceiling and limited the number of insertions. Optional insertion dates, limited space and other restrictions on national advertising had been imposed, and by the end of 1943 strict rationing plans were being formulated.

Stringent limitations on classified were universal. Agate type, limited display, limitation on number of lines, dropping of out-of-town help-wanted advertisements and so on helped to save paper. Further cuts were made through compact writing and editing of editorials, shorter stories, fewer features and slashing of comics, women's pages and financial news. Saturday editions were streamlined to six or eight pages; Sunday gravure sections were changed to tabloid size by many papers. Comparatively few newspapers froze circulations; some discontinued circulation promotion. More papers raised both per-copy and subscription rates. Newspapers supported government war projects by selling advertising for war loans and other campaigns and by increased use of informative institutional advertising.

Radio.—*See* RADIO.

Retail.—The use of institutional advertisements increased greatly among an overwhelming number of retail advertisers. Promotional copy using comparative prices and emphasizing big sales and special events was eliminated by practically all stores, resulting in the reduction of buying of scarce articles.

Of all retail advertising, 85.9% was in newspapers; 4.2% in radio; direct mail 4.5%; and other 4.7%.

Direct Mail.—This medium held up fairly well but changed somewhat in its nature. Printed promotion geared itself largely to the war effort and users of direct mail tied in their appeals with the various major wartime projects.

The Graphic Arts Victory committee issued a guide book which was helpful in supplying information to users of printed promotion in tying up their printing with the war effort. The Graphic Arts Victory committee was also instrumental in assisting all types of organizations in successfully using the convention-by-mail method, resulting in hundreds of conventions being cancelled which contributed greatly in relieving transportation problems. The committee also pointed out many ways to make paper really "stretch." Catalogues, directories and shopping newspapers were assigned paper quotas limiting them to 85% of 1941 usage.

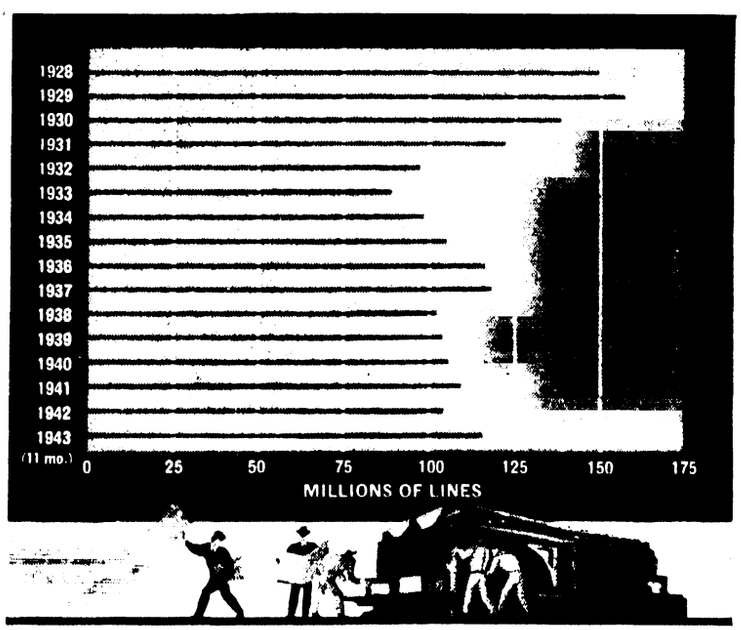
Display.—Display advertisers keenly felt the effects of restrictions. A War Production board order in October banned the use of new fibreboard containers for shipping displays. The industry protested, charging the order unjustly discriminated against the

[1]January-September. No later figures available.

entire graphic arts industry, particularly the advertising display branch, and claimed it would practically eliminate this advertising medium. Little hope for immediate relief was in sight at the end of 1943.

Transportation.—This medium showed the largest percentage of gain over previous years of any major media. Volume was up more than 20% over 1942, grossing approximately $10,000,000. Sixteen per cent of this was local and 40% national advertising. Many cities were completely "sold out" with practically all space reserved for months ahead. Rate increases were prevalent. Most national advertising continued to be on branded goods, chiefly foods and drugs.

The industry's War Campaigns pool contributed approximately 100,000 free spaces per month to the government for war messages. Carded vehicles increased slightly, numbering 85,000. Riders exceeded 22,000,000,000 as against 18,000,000,000 in 1942.



Outdoor.—Traffic Audit bureau tabulations were resumed in 1943. Reports for the May 15–June 30 period based on 105 cities showed that, compared with 1939–41 audits, 65 cities increased in effective circulation, 36 decreased, while 4 remained the same.

Consumer.—Copy for the woman consumer reached down-to-earth realism in the face of shortages. Food advertisements gave as much information about nutrition as food editorials, as well as many friendly helps on making scarce foods go farther, maintaining the health of the family and getting variety out of short stocks on grocers' shelves. Other copy taught consumers how to get more wear out of many everyday commodities.

A survey of buying habits disclosed that 58.8% of housewives visited more stores to obtain food products and 55.7% went to more stores for meat. Changes in buying habits extended to practically all purchases. Despite shortages, housewives kept their homes well supplied by means of substitution and shopping around.

Branded products, however, were menaced by two factors: (1) unavailability of branded goods and the offering of substitutes, and (2) compulsory grade labelling in fixing price ceilings. These factors were partly offset by advertising of brand names and by adjustments in grade labelling in relation to quality.

Research.—Due to an increased demand for factual data, government agencies effectively used private research organizations. For 11 months of 1943, 41 special reports were compiled as against 23 in 1942, in response to specific requests from various agencies. Data on 57 commodities were compiled relating to consumer sales, rationing, allocation of vital war materials, price freezes and price ceilings.

NEWSPAPER ADVERTISING (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

A study made by the Association of National Advertisers revealed that the public wanted modest, informational advertisements with a description of postwar products, data on war-winning projects and information on how to co-operate with them. This study also showed that people were aware of the job business was doing in the war effort and that they wanted companies to continue advertising because names should be kept in the public eye. Forty-seven per cent believed advertised products were superior to nonadvertised ones. Interest in what manufacturers were doing to help in the war was definitely on the downgrade, however.

Another study made among farmers showed that three-quarters of those questioned thought (1) business advertising helped them, (2) private management ran business better than government could, (3) government-owned plants should be sold to manufacturers after the war and not run in competition with business. Both studies reported that a very high percentage of persons felt that business' war effort was good.

Great Britain.—With government advertising still leading in total spending, British advertising during the first nine months of 1943 amounted to approximately $40,882,000 as compared with $39,672,000 for the same period in 1942, a gain of 3%. Most conspicuous change in advertising of private commodities was the decline of cigarette advertising. Other goods on which advertising decreased were biscuits and baked products, soaps, furniture, whiskey and other products rationed or short in supply. Volume of advertising actually increased, however, on some short-supply articles, such as shoes, hosiery, chocolate, tea, textiles, motor cars and tires.

Despite drastic paper restrictions, British magazines increased in circulation. Lighter weight paper, readjustment in format and typography, suspension of some publications to support others for the duration and a slight boost in paper quotas helped to supply the increased demand.

In doing a wartime job, advertising in Great Britain ceased to be aggressively competitive and became educational and helpful.

The British war office produced a series of grim posters aimed at reducing serious accidents caused by improper handling of ammunition taken from defective but unspent grenades and similar objects picked up from practice ranges. Subjects of the posters were the result of a careful study of the situation by the public relations department.

Canada.—In addition to restrictions already imposed on newspapers and periodicals, limitations of as much as 50%, aimed to curb over-all use of printed matter, were levied by a Canadian Wartime Price and Trade board order. Business reply postcards and envelopes, blotters, jumbo size or multi-sheet calendars, and new catalogues or price lists illustrating goods or services were banned. Display of printed poster or card advertising was limited as to size of poster and place of display. Exceptions, however, were on printed matter for religious, charitable and similar groups when it contained no advertising.

South America.—*Argentina.*—Advertising volume in Argentina remained practically the same as for 1942. Stringent governmental supervision over pharmaceutical advertising in all media was introduced and advertisements for medicinal products had to be approved in complete form before publication.

Paper shortage was acute but toward the end of 1943, through improvements in shipping and local newsprint manufacture, the situation had eased somewhat. The bulk of Argentine advertising was devoted to local industry. Orders for strict control of broad-

casting were issued in June, which included limitation of length of commercials, use of pure Spanish only, approval of scripts of programs by the Department of Radiocommunicaciones, licensing of speakers and artists, barring of audiences from studios and many other extreme measures. (*See* also NEWSPAPERS AND MAGAZINES; RADIO.) (D. ST.)

Aero-otitis and Aerosinusitis: *see* EAR, NOSE AND THROAT, DISEASES OF.

Afghanistan. A Moslem kingdom lying between India and Iran; area 250,000 sq.mi.; pop. (est. 1940) 10,000,000; chief towns: Kabul (cap., 80,000), Kandahar (60,000), Herat (50,000), Mazar-i-Sharif (30,000). Ruler: Mohammed Zahir Shah; languages: Persian, Pushtu, and some Turki in the north; religion: Mohammedan.

History.—There was little change in internal affairs during the year. On Nov. 26, 1942, the 9-year-old crown prince, Mohammed Akbar Khan, died. Foreign policy continued along the same lines of neutrality and friendship with Afghanistan's neighbours, and at the beginning of 1943 the Saadabad Pact with Turkey, Iran, and Iraq was automatically renewed for a further five years, as none of its signatories had denounced it six months before expiration.

A new departure was taken by the appointment on June 1 of the first Afghan minister to the U.S.A., Abdul Hosayn Aziz, who had formerly represented his country in Moscow. On Oct. 24 it was learned that negotiations for a treaty of alliance between China and Afghanistan had been completed in Ankara.

(C. M. CL.)

Education.—Confined chiefly to Kabul. Elementary schools exist throughout the country, but secondary schools exist only in Kabul and provincial capitals. Both are free. There were, in 1940, 130 primary schools and 1 normal school for teachers in Kabul. In addition there were 4 secondary schools and 13 military schools. Technical, art, commercial and medical schools exist for higher education. The Kabul university was established in 1932; only a medical faculty existed in 1940.

Finance.—Revenue and expenditure about 150,000,000 (Afghan) rupees; currency: Rs. 3.95 (Afghan) = Rs. 1 (Indian) = 30.12 cents U.S. (July 1943).

Trade and Communication.—(1939–40) Exports to India: Afghan merchandise Rs. 3,97,06,681; treasure Rs. 16,655; non-Afghan merchandise Rs. 2,008. Imports: Indian produce Rs. 72,79,399; other produce (imported through India and in transit) Rs. 1,96,25,197. Persian lambskin is one of the most important exports. Other exports are carpets, fruit, wool and cotton. Roads: trade routes, Kabul to Peshawar (India) 210 mi.; and Kandahar to Chaman, 70 mi.; there are about 2,265 mi. of unmetalled roads connecting the chief towns.

At the beginning of 1941 there were five wireless stations in the country.

Agriculture.—Wheat, rice, millet, maize, sheep, Persian lambskin, wool (1938) 6,800 metric tons.

Agricultural Research Administration.

Among other steps in a major reorganization of the U.S. department of agriculture in Dec. 1941, seven bureaus of agricultural science were brought together into a unified group under an administrator of agricultural research, who was charged with the general supervision and direction of their scientific work. Together, these bureaus, each of which retained its identity, constituted the Agricultural Research administration. The step was a significant one in scientific organization, making possible closer co-ordination of a wide range of research and more effective pooling of resources of knowledge, personnel and material for simultaneous attack on major problems. Hastened by World War II, which made quick action on urgent problems imperative, the move was in line with a growing trend toward greater co-ordination and less sharply defined departmentalization in research.

The agencies in the Agricultural Research administration and their principal functions as of 1943 were as follows:

Bureau of Agricultural and Industrial Chemistry.—In addition to several general research divisions, it operated the four regional research laboratories: eastern, at Philadelphia, Pa.; northern, at Peoria, Ill.; southern, at New Orleans, La.; western, at Albany, Calif. These laboratories were concerned largely with developing new and wider industrial uses for agricultural products and by-products.

Bureau of Animal Industry.—Conducted research on the diseases and parasites and the breeding, feeding and management of domestic animals, including poultry, as well as on livestock products; conducted disease eradication work; administered certain quarantine and regulatory measures.

Bureau of Dairy Industry.—Conducted research on the breeding, feeding and management of dairy cattle and the manufacture and utilization of dairy products and by-products.

Bureau of Entomology and Plant Quarantine.—Conducted research on injurious insects and on honeybees; administered certain quarantine and regulatory laws and conducted control and eradication campaigns relating to insect pests and plant diseases.

Bureau of Human Nutrition and Home Economics.—Conducted research on nutrition, the nutritive values of foods, food preparation and preservation, textiles, clothing, household equipment and family economics.

Bureau of Plant Industry, Soils, and Agricultural Engineering.—Conducted research on the breeding, management, diseases, and introduction and adaptation of crop and other economic plants; the surveying, classifying and mapping of soils; the development and use of fertilizers; the development and use of farm machinery, buildings and equipment.

Office of Experiment Stations.—Administered federal grants to state and territorial agricultural experiment stations, co-ordinated their work with that of the department of agriculture, and operated the federal experiment station at Mayaguez, Puerto Rico.

The Agricultural Research administration also had charge of the Beltsville research centre, Beltsville, Md. (near Washington, D.C.), where extensive research facilities—laboratories, greenhouses, farm buildings, fields, orchards and woodland—were located. Nine regional research laboratories in various parts of the country, called Bankhead-Jones laboratories from the legislation which created them, were being administered by the bureaus or directly by the administrator in 1943. In addition, field stations operated by the bureaus were widely distributed over the United States, and much work was carried on co-operatively at state experiment stations. The purpose of this decentralization was to have the experimental work adequately represent the wide range of environments in the United States as well as to adapt it to regional and local needs.

Work of the Agricultural Research administration in 1943 was concerned almost entirely with war problems related to agriculture and to the needs of the armed forces and the civilian population. By mobilizing research facilities, personnel and the knowledge accumulated from previous research, practical solu-

tions for many of these problems were worked out with unusual rapidity. Among the scores of developments resulting directly from this research were revolutionary new methods of destroying injurious insects, particularly disease-carrying lice and malarial mosquitoes; new, highly effective insect repellants; safe and satisfactory ways of dehydrating vegetables and meats for overseas shipment in large quantities; great increases in the production of oil, fibre and drug crops formerly for the most part imported and therefore relatively unfamiliar to United States farmers; the safeguarding of wartime diets from the health standpoint by sound scientific findings; wartime changes in livestock rations based on research; new methods of combatting livestock diseases and parasites; new or improved machinery for handling various crops; new processes for making industrial products such as alcohol, rubber substitutes, plastics and cork substitute from farm products and by-products; and methods for making the production of the new drug, penicillin (*q.v.*), commercially possible. (E. C. AR.)

Agriculture. **Crop Production.**—The gross production of crops in the United States in 1943 was estimated by the U.S. department of agriculture as 6% less than the record-breaking crops of 1942 but nearly 5% more than any previous year. In comparison with the average of the five years 1937–41, production of the 53 principal crops was up 9%. The favourable returns of 1942 and 1943 were due to several factors: (1) better than average growing seasons; (2) improved farm practices; (3) changes in the Farm Adjustment program; (4) higher prices of farm products; and (5) willingness of farmers and their families to work long hours to aid the war effort. The chief handicaps were shortage of labour, farm machinery and other supplies, and changing government policies and regulations.

Comparing the production of the war years with the ten-year pre-drought period of 1923–32 the production of 53 principal crops was: 1939—102.8%; 1940—107.4%; 1941—109.9%; 1942—124.1% and 1943—116.8%. It will be seen that the record production of 1942 was almost one-fourth greater than in the 1923–32 period. The increase in the production of vegetables for market was 144.4% in 1942 and 138.5% in 1943; in vegetables for canning and drying 225.1% in 1942 and 199.8% in 1943. These increases were the result of expansion of acreage as well as more favourable seasons which assured high yields. Had the United States experienced the bad weather of the years 1933–36 the results would have been disastrous. Compared to the pre-drought period of 1923–32 as 100 the production of 53 crops in 1933 was 88.9%; 1934—71.7%; 1935—95.2% and 1936—79.5%.

The expansion of crop production in acreage continued after 1939, but the total for 52 crops harvested, 347,498,000 ac., was less in 1943 than the average of the five years 1929–33, the high year being 1932, when 361,794,000 ac. were cultivated. Early in the 1943 season there were great difficulties in some areas from floods and to a less extent from drought. About 13,500,000 ac. of crops were lost in 1943, nearly 2,000,000 ac. more than in 1942.

Crop yields were mostly lower in 1943 than in 1942 but higher than in any of the years 1937–41. Compared with the pre-drought average, 1923–32, the yields of all crops, except vegetables, was 124% compared to 130% in 1942 and a range of 114 to 122 in the previous five years. Potatoes gave a record yield of 140 bu. per acre.

The crop season of 1943, as previously noted, was marked by several losses from floods and drought in widely scattered areas. In May heavy rains from Oklahoma to Michigan delayed planting, and June brought floods in the lower Missouri valley. July and August were mostly hot and dry, with severe droughts in Arkansas and in a belt extending from New Jersey southward into Virginia. The dry summer favoured farm work and enabled farmers with a scarcity of labour to complete their harvesting and to do an unusual amount of fall plowing. The lack of good rains reduced the feed in pastures and ranges and accentuated the feed shortage.

LUNCHEON FOR WHEAT HARVESTERS near East Grand Forks, Minn., in the summer of 1943

Fruit production in 1943 was the smallest since 1938, about 12% below 1942. The yield of fruit was about 11% below 1942. Exceptionally small crops of apples, pears, peaches, cherries and strawberries were harvested. Early spring freezes and bad weather

during pollination periods were the principal causes for the small crops. Grapes, however, produced the largest crop on record and the output of all citrus fruits was high. Truck crops of all kinds showed about 10% less total than in 1942, which was offset to some extent by the great increase in victory gardens. The production of feed crops, hay and grain was not large in proportion to the large numbers of livestock on farms. The feed shortage in the eastern states was particularly severe in late summer, partly because of the drought in the Atlantic coast states from Virginia northward. While the total hay crop was the second largest ever produced, the supply per unit of livestock was less than in previous years.

Table I.—*Index Numbers of the Volume of Agricultural Production through Two War Periods

(1935-39=100)

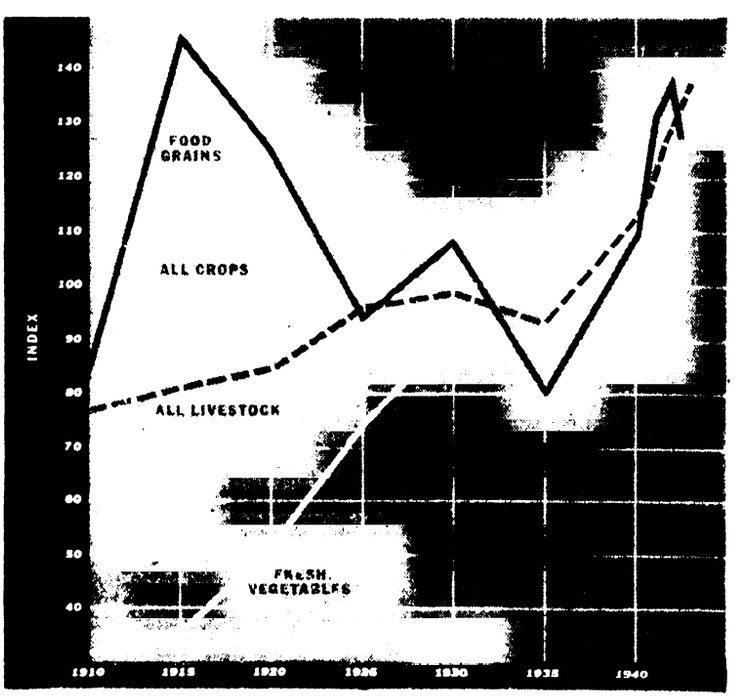
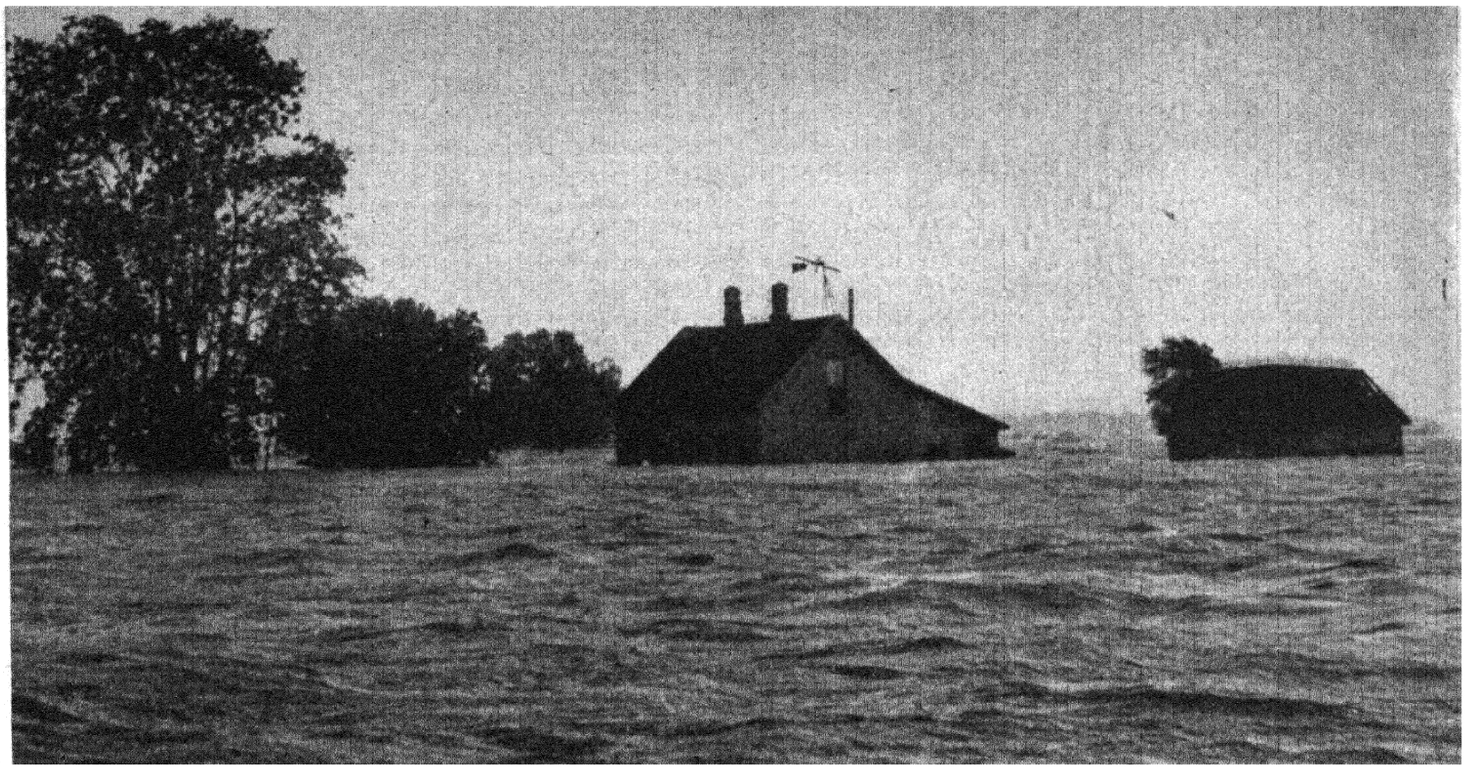
*From estimates by the bureau of agricultural economics, U.S. department of agriculture

The expansion of agricultural production compared to other years is indicated by the index numbers of the volume of agricultural production shown in Table I. This shows the decline in the production of food grains as compared to all crops and livestock and the very striking increase in the vegetable crops. These changes indicate a fundamental change of diet in the United States, namely, the consumption of more fresh vegetables in salads and sandwiches and a shift away from surplus-grain production.



Livestock Products.—The total production of livestock and livestock products made a new high record in 1943, although the total milk production dropped slightly below 1942. The total numbers of all livestock increased through the year, partly as the result of several years of good feed production on pastures and ranges. The increases in hogs and cattle more than offset the decreases in sheep, horses and mules. The large supplies of feed grains in 1942 led farmers to expand herds except where the shortage of labour was a retarding force, as on the sheep ranges and on many dairy farms. The hog expansion was beyond all expectations, with the spring and fall pig crops amounting to 127,000,000 head compared to the ten-year average of 73,148,000 head. This large increase, combined with full feeding to heavy weights because of the very favourable corn-hog ratio, led to record runs of hogs at the stockyards and slaughter houses in the late fall of 1943. The rationing points on pork were reduced in an effort to move the excess pork into consumption and thus relieve storage facilities. This flood of pork and the general feed shortage led the War Food administration to reduce the goals for 1944 to a total of 105,000,000 pigs. The ceiling price on corn was stated to be the chief factor in leading hog growers to feed their pigs to maximum weights, since at the ceiling prices for live hogs of $13.75 per 100 lb. at Chicago it was more profitable for them to feed their corn than to sell it. One result was that the processing plants using corn for industrial purposes were unable to get supplies until the government intervened and moved some of its stocks. There was also a large demand for corn in the eastern states that could not be filled from the usual midwest sources.

Milk production declined in 1943 from the record production of 119,240,000,000 lb. in 1942 to about 118,000,000,000 lb. A lower average yield per cow was believed to be due to the shortage of feed in the eastern dairy areas and drought in others. The percentage of the dairy cows being milked declined during 1943, reflecting the labour shortage on dairy farms. In the fall the government moved to check the decline in milk production by proposing subsidy payments and larger supplies of feed. Butter production was about 1% more in 1943 than in 1942 but was below the 1935–39 average and insufficient to meet the full needs for all civilian, military and lend-lease requirements. Cheese production declined for the same reasons, and some cheese factories shifted to butter-making where cream supplies could be obtained. The rationing of both butter and cheese became more severe during the later months of 1943. The production of evaporated, condensed and dry-skimmed milk continued higher than in 1942, although the shortage of fluid milk was also reflected in these products.



In calling for a goal of 122,000,000,000 lb. of milk for 1944, the War Food administration recognized the necessity of increasing the output per cow about 30 lb. of milk over 1943 levels and 60 lb. over the five-year average. In order to attain this increase, higher prices to producers, better supplies of feed and more fertilizer for pastures and hay crop were proposed.

The total numbers of chickens on farms and chickens raised reached a new high record in 1943, about 15% above 1942 and 28% above the ten-year average. Egg production likewise made a new high record of about 5,000,000,000 doz. or 12% more than 1942 and 45% above the average. The goal for 1944 was set at 5,000,000,000 doz., but the feed shortage was such that a culling of flocks had begun before the end of 1943. Farmers were advised to reduce the number of broilers to be fed to save feed for laying flocks.

The grand total of meat production of all kinds in 1943 was about 13% above 1942 and nearly 50% above the average of 1935–39. Military and lend-lease requirements amounted to about 25% of the total, leaving less than a normal supply for civilians. Thus a continuation of the rationing system was necessary. The total available for civilians, however, was about 128 lb. per capita in 1943—only 5.9 lb. less than was consumed

INDEX NUMBERS of U.S. production of food grains, all crops, all livestock and fresh vegetables through World Wars I and II. Food grains declined, while vegetables increased greatly. All crops and livestock made great advances after 1940

FLOODWATERS OF THE WABASH RIVER pouring across a farm late in May 1943. Planting in many parts of the midwest was delayed three weeks and early crops were ruined by the floods

in 1942. This compared with an average consumption of 126 lb. per capita in the period 1935–39.

Total food production for 1943 was estimated by the U.S. department of agriculture to be 5% above 1942 and 32% above 1935–39. The record output of livestock products more than offset the decline in crop production. It was also estimated that civilian food consumption per capita in 1943 was 5% above the average for 1935–39. The 1943 civilian food supply, while short in meats and dairy products, was richer in essential nutrients than in 1935–39 with a few exceptions.

Table II.—*Production Figures of Selected U.S. Crops, 1933–43*

(000s omitted)

* Preliminary.

Stocks and Reserves.—The ever-normal granary idea and the widespread belief that the United States was a country of perennial surpluses led the public to question the necessity of rationing. While the U.S. produced surpluses for export before World War II and even in greater amounts in the decade before World War I, these surpluses were seldom accumulated for more than a half year, since the storage and marketing facilities required constant in-and-out movement. A large world wheat crop in the western hemisphere caused a large carry-over of wheat to accumulate in 1941 and 1942, a total about equal to a year's domestic U.S. consumption. Up to the spring of 1943 the policy of the government was to limit production to domestic requirements. Then suddenly the need for wheat for food became evident, and acreage and marketing restrictions were removed for both the 1943 spring seeding and for the fall seeding for harvest in 1944. In July the government decided to raise the goal 26% above that for the 1943 acreage. In addition to the unexpected demand for wheat for feed, more than 125,000,000 bu. were used for making alcohol. The U.S. export market was practically closed, taking only about 35,000,000 bu. Canada, with a surplus of nearly 700,000,000 bu., was able to supply Great Britain's needs without difficulty.

The carry-over stocks of other grains—corn, barley, etc.—amounted as usual to only a small part of the year's production and were simply carried from harvest to time of use, with the usual reserves for seed and ordinary needs. The reservoir of food was on the farms and in the marketing channels—grain elevators, storehouses, cold storage plants and other distribution agencies. Aside from the grains and flour and feeds for livestock, the food reserves of large U.S. cities were very small, sufficient for only one to three weeks at most. Stocks of meats, fats, eggs and dairy products were equivalent to two or three weeks' consumption. In 1943 the storehouses were overcrowded because of reserves purchased and held by the government for the use of the military forces and lend-lease obligations. Some representatives of occupied countries purchased supplies to be used for relief and found it necessary to move them because of the cost of storage, spoilage and the need of the storage facilities for current use. Therefore the production in 1943 represented the food supply in general terms. In the case of perishables such as eggs, milk and its products and vegetables this was particularly true. The development of preserved, frozen and dehydrated products gave some promise of being able to carry over the surpluses in useful form, but these processes had yet to be fully developed in order that such preserved products might compete with the fresh product. (*See* also UNITED STATES.)

Lend-Lease Food Requirements.—Purchases, shipments, resale and transfers were so numerous and involved in 1943 that the quarterly reports on lend-lease to congress gave only some general measures of value and estimated percentages of the U.S. supply. As a general estimate lend-lease shipments were reported by the government to have amounted to about 6% of the U.S. domestic supply in 1942 and were expected not to exceed 10% in 1943, with the same amount allocated up to June 30, 1944. Values alone were not a full indication because of the many highly concentrated forms being shipped, such as the dehydrated foods, to save shipping space. The grand total value

of exports shipped to June 30, 1943 was reported as $9,882,000,000, of which foods and other agricultural products amounted to $2,085,000,000 in value. This was the largest single item, exceeded only by ammunition and aircraft and parts, which totalled $2,716,000,000. During the first year of the operation of lend-lease, foodstuffs constituted 30% of the total, while during the second year these goods had declined to 18% of the total because of the great increase in shipments of munitions. The

food was sent principally to the United Kingdom and the soviet union, which together had received 93% of all goods shipments through June 1943. At times the need for food was so critical in the soviet union that foods were given preference over munitions for shipping space. From the outbreak of war the United Kingdom had by the end of 1943 increased its production from 40% to 70% of its requirements. Of the other 30%, the United States supplied about one-third, or 10% of the British consumption. Since supplies were being maintained at the very minimum of necessity, this part was a vital factor in assuring the continuation of British life.

The soviet union had lost about 40% of its most fertile crop land by 1943. Shipments to the soviet union were designed to aid the armies but did little to improve the inadequate diet of civilians. Food was shipped to North and West Africa to carry the civilian population over until the 1943 harvest, the Germans having removed most of the remainder of the 1942 crops. Seeds for planting formed a large part of the shipments early in 1943 and by the middle of the year other shipments had begun to decline.

While the total amount of food shipped under lend-lease was only 10% of the U.S. supply in 1943, the part of all foods was not in this proportion. Of some products as high as 30% of the U.S. supply was shipped, canned fish for example, while of butter only seven-tenths of 1% of the supply was exported.

In June the War Food administration tentatively allocated the available food to be produced from July 1, 1943 to June 30, 1944 as follows: for civilians 75%; for the armed forces 13%; for lend-lease 10%; and for U.S. territories and special needs 2%. This meant a slightly smaller civilian supply than in 1942 but more than in 1935–39.

Farm Income.—The gross farm income was estimated by the U.S. department of agriculture to be $22,700,000,000 in 1943—the largest on record and more than $4,000,000,000 above the $18,628,000,000 income of 1942. This high return was the result of the record volume of production which sold at the high prices. The gross income figures presented a more favourable situation than the facts justified because of the rapid advances in production costs. Production expenses in 1943 were estimated at $10,200,000,000, leaving $12,475,000,000 as the net income of farm operators. The gross farm income included cash income from sales, government payments, the value of products retained for human consumption on the farm and a rental value for the farm home. A part of the income of people on farms was obtained from nonfarm sources and in years prior to 1943 this had amounted to 30% of the net income of persons on farms. No annual estimates were made, but special studies indicated that the total may have been more than $3,250,000,000 in 1942 and even greater in 1943. There was also a considerable income of nonfarm people from agriculture, estimated to have been about $1,700,000,000 in 1942. When comparing farm and nonfarm incomes these items must be considered. The total net income from agriculture per person on farms in 1943 was estimated to be about $430, compared to $368 in 1942 and $232 in 1941. Similar estimates of the income of persons not on farms placed their average income at about $1,428 for 1943 compared to $1,022 in 1942. The income of persons in agriculture in terms of percentage of the national income was estimated to be more than 12% in 1943 compared to 9.5% in 1942. The total farm population included only 21.7% of the total population in 1942 and a somewhat smaller part in 1943 since many persons had left the farms. The total number of people on farms was smaller in 1943 than in 1910. The high total was reached in 1916, when farm population was put at 32,530,000 persons. The decline was almost constant to 29,000,000 in 1943.

Government payments were a relatively small factor in the total farm income. In 1942 they amounted to $697,000,000. The previous high total was in 1939, when $807,000,000 was paid. The expenses that increased most during the war years were wages for labour and other current operating expenses. Interest on mortgages was down because the total mortgage debt of farmers was much below the high level of 1921 to 1929 inclusive. Expenditures for buildings and machinery were checked by the difficulties of getting materials and machines. Taxes were lower in 1942 than in 1941, as inventories had not been increased.

Table IV.—*U.S. Farm Income, 1943 and 1942*

	Jan.–Oct. 1943*	Jan.–Oct. 1942
All crops	$6,144,000,000	$4,856,000,000

Government payments	582,000,000	564,000,000
Total	15,318,000,000	12,103,000,000

*Preliminary.

Prices of Farm Products.—Farmers received prices that averaged about 20% higher in 1943 than in 1942. The index of all farm products as estimated by the U.S. department of agriculture rose from 157 for the year 1942 to 192 in Dec. 1943. In 1939 the index was 92, having declined from 121 in 1937 and a previous high point of 156 in 1925. Farm prices did not reach their high peak in 1929 preceding the depression but stood at 146 for that year. The usual war influence was seen when World War II began and the index rose to 98 in 1940; to 122 in 1941; and to 157 in 1942. This general average index for the prices of all groups of farm products does not indicate the variations between different products which were as follows: truck crops, 264; chickens and eggs, 212; meat animals, 203; fruits, 197; dairy products, 187; cotton, 171 and grains, 162. All efforts to stabilize farm prices were not effective, and these prices followed the same general course as in World War I, but did not reach the high levels they did in 1919, when the index was 228, dropping the next year to 157. Different products reached high levels in 1919, grains for example being 233 as compared to 162 in 1943 and cotton 247 compared to 171. This generally lower price level

was the basic cause of the efforts to increase prices to farmers, to secure greater production. The question became involved in the controversy over the method of payment, whether by subsidies or by higher ceilings.

The farmer's true price position—the relation between the price he receives for his product and the prices he pays for the labour and materials that he buys—was indicated by the index of the ratio of prices received to prices paid which is the basis of "parity." This index for 1943 stood at 116 compared to 104 in 1942, 92 in 1941 and 78 in 1940. Not since 1920 had this index reached 100 until the United States entered World War II in 1941. The prices farmers had to pay for commodities they had to buy for living and production, and interest and taxes were slightly below the level of prices of farm products, except for labour which stood at 280 compared to farm prices at 192. At the same time the cost of living index was 124 and the income of industrial workers 316. The cost of food rose faster than nonfood items in the cost of living index, which the government sought to control by price rollbacks.

Agriculture and World War II.—The output of U.S. crops and livestock in 1942 and 1943 demonstrated that the requirements of civilians, military and lend-lease aid to the Allies were met. Any extra food for relief had to come from a reserve built up through careful rationing, or a change in the diet habits of the American people, unless a renewed campaign for higher production was to be undertaken as a national policy. An analysis of the factors needed for greater food production reduced them to land, labour and machinery.

The land available for expanded production was not of the best fertility in 1943, and the costs of production would be higher than on the better lands being used in 1943, but a somewhat higher food price level would not be entirely out of line with wages and incomes and would probably lead to more economic use of food. The machinery needed could be produced quickly if the facilities being used in 1943 for ships and certain types of munitions were diverted to this use. Intensive fabrication of repair parts and the widespread development of repair stations were used enough to indicate that they would be effective in stretching machinery for the duration. Farm machines are seldom wholly worn out; they are simply discarded for newer types when the replacements become expensive.

The crux of the problem in 1943 was labour. Agriculture lacked several million trained men to bring it to a state of higher efficiency. The combined loss of the young men to the military forces and to war industries was the greatest weakening factor.

Table V.—*U.S. Production and Yield per Acre for 1943 and 1942 Crops*

Crop	1943 yield* per acre	1943 production*	1942 yield per acre	1942 production

*Estimated. †Pounds.

FOUR-H BOY AND GIRL helping harvest corn during the agricultural labour shortage of 1943

Estimates varied greatly as to the number of men who had left the farms. The U.S. department of agriculture estimates showed that the number of farm workers on farms in Jan. 1943 was 8,171,000 and in July, 11,750,000. The difference between these numbers was the number who were hired for summer work. They came principally from small towns and villages where they had other employment that they could leave for the summer period. Out of these millions could be recruited possibly a part of the replacements needed until World War II ended and some of the millions who left the farms returned.

Crop Insurance.—The government experiment in crop insurance got a severe setback in 1943. Congress withdrew support for the work from the appropriation act of June 1943–44, and by the end of the year had not restored anything to continue the work in 1944 after July 1. Only sufficient funds were provided to complete the contracts for 1943.

The reasons given for the action were that the use of the law was too limited and the expenses too large to justify its continuance. Losses greatly exceeded the premiums. About 500,000 farmers were assisted in the four years 1939 to 1942 when they had crop failures, while many others had protection though they did not suffer losses. Out of 1,633 counties in which wheat was insured in 1942, 245 counties paid no losses and 308 paid losses less than one-fourth of their premiums. In 961 counties or more than half of them, losses paid were less than the premiums.

The basic law providing for the work still stood and a new and revised plan was proposed. Insurance authorities stated that the work had not been tested over sufficient time to provide an adequate basis for determining premiums and the best method of operation. The original idea was for the government to provide for administration while the premiums were to cover the risks. Participation was voluntary, which made it necessary to enlist the interest of the farmers in large numbers, and since the plan was untried this was found very difficult to do quickly.

The principal problems met with were: how to secure larger participation; how to determine risks with the limited data on many farms; how to spread the risk to cover bad years and the changes in operators. Acreage abandonment offered another problem on which there was insufficient data to determine a safe rate of premium. A three-year contract was adopted in 1943 to spread the risk. The system was tried only on wheat to any considerable extent. In 1943 there were 487,000 wheat contracts or about one-third of the wheat growers who were eligible. For cotton, only about 10% of the producers were listed and losses the first year were about 166% of the premiums. Proposals were made to use insurance in connection with war-emergency crops as a safeguard for those who were expanding acreage. It was estimated that

the cost to the government would be about $100,000,000 for the seven important crops, potatoes, flax, hemp, peanuts, dry beans and peas and soybeans. (J. C. Ms.)

Great Britain.—While the government's agricultural policy remained the same, namely, the maximum production of bread corn, potatoes and sugar beet with the maintenance of milk production, county war agricultural committees were instructed to pay more attention to the efficiency of livestock production. These committees were given the additional powers necessary and appointments of livestock and milk production officers were made. The problem facing these officers was to raise to as high a standard and as quickly as possible the general level of efficiency of production. In the direction of milk production a number of important steps were taken. First, milk recording was taken over by the Milk Marketing board, and a national milk records scheme was introduced at the beginning of 1943. The enrolment under the scheme up to October was encouraging and indicated that more and more farmers were realizing that a system of milk recording in their own herds was the first essential in a sound breeding policy and economic production. Secondly, a classification of all dairy herds was being undertaken and farms were to be placed in grades. Concentration of effort would be directed toward helping and where necessary stimulating those who were most in need of such help with a consequent raising of the level of their cattle and their own efficiency as producers. The third important measure was that county committees prepared a register of bull breeding herds, the purpose of which was to make arrangements whereby a wide dispersion, among the ordinary dairy farmers, of good bull calves from the best herds could be brought about.

Every effort was being made to prevent any further decrease in the numbers of pigs and poultry so that the existing nucleus of breeding stock could be retained. Steps were also taken to stimulate sheep production especially in the mountainous areas.

From a figure of some 50,000 tractors in 1939 there were in 1943 about 125,000 in use on British farms. With this there had also been a large increase in the number of tractor-drawn implements and other machinery such as excavators. Part of this increase in tractors and machinery was in the hands of individual farmers, but county agricultural committees owned some 8% of the tractors and carried out tillage and other operations for farmers on a contract basis. All tractors and machinery, owned privately or otherwise, had to be used to the maximum, and committees had power of direction in regard to all machinery. Voluntary machinery pools were formed by farmers in many areas, as a form of mutual help, and were operating with marked success.

Weather conditions were variable throughout Britain in 1943; the drier areas suffered from insufficient rain throughout the growing period but other areas had a plentiful supply. The hay crop was good and in many areas got in under excellent conditions. Harvest conditions were early and good in the south but difficult in other parts, but on the whole the weight of threshed grain was again expected to be high.

The structure for the control of prices remained and only minor changes in individual products were made. In milk production an increased bonus was given for milk from tuberculin-tested herds.

British Empire.—Curtailment of world markets, shipping difficulties and restricted manpower supplies continued to be the primary problems of dominion farming during 1943. In Canada the shift to livestock and dairy farming continued and greatly benefited farmers, especially in Ontario and Quebec, while the problem of the wheat surplus in the prairie provinces was partly eased by export to the deficit areas of eastern Canada and to the United States. In New Zealand exports continued to be restricted to those covered by the war agreement with Britain, but the increasingly difficult manpower situation was the most serious impediment to farm production both for the export and for the domestic market. In Australia, wheat production continued to outstrip demand and the urgent problem was to direct farm production into new channels to meet the situation created by the loss of the export market and by the new task of provisioning the large body of United States troops on Australian soil. South Africa continued to be without an export market for its deciduous and citrus fruit, and it was difficult also to export all the wool clip sold under agreement with the British government. The loss of the overseas trade was, however, to some extent made up by the increase in domestic demands which resulted from the changed situation in the North African sphere of hostilities. (R. Ra.)

Other Countries.—The world-wide situation with respect to food production in World War II was almost the reverse of that of World War I. In the first war the central European countries were in a vulnerable position and the Allies controlled most of the food-exporting areas of Europe as well as all of those in the rest of the world. At the close of 1943, after four years of war, the enemy countries still held almost all of Europe and a vast area in the east, and surrounded China. For two years Germany had controlled the breadbasket of Russia, the Ukraine and the Danube basin. For a time the enemy blocked the seaway through the Mediterranean to the east, forcing all ships to take the long route around Africa or risk sinking. Japan controlled one-third of the world's supplies of oils and fats and most of the rubber.

Only the western hemisphere was free to the United Nations, together with Australia, New Zealand and South Africa. While these countries were normally surplus producing, their output was not equal to the extra requirements without expansion to the maximum. The soviet union, normally more than self-sufficient, became in the second year of World War II critically short of food because of the German invasion. While the blockade of Europe was tightly held, there was no prospect of weakening Germany by food shortage until late in 1943, when the Russians threatened the Danube basin and advanced in the Ukraine.

Food products from the United States fed about 10% of the British people, but more important was the fact that the United States was able to supply certain vital necessities, which though not used in great quantity were very essential to keep up the diet of the people.

The Russians' need for food was unexpected at the beginning of the war. While the exports of the soviet union had never risen to the levels of the old Russia, it was believed that it had ample supplies to support both its armies and civilians. But the fact that millions of Russians had lived close to the margin of subsistence, mainly on grains and potatoes, made them particularly vulnerable when the area for these crops was suddenly reduced by the loss of large areas to the Germans. This loss amounted to nearly 40% of the best grain land, 80% of the sugar beet area, 60% of the hogs and 40% of the cattle producing country. The losses in animals in the areas invaded were very severe. Only by depriving the civilians of supplies did the soviet armies keep supplied with enough food to carry on. Most of the people lived and worked on rations 20% to 40% below U.S. normal requirements. The removal of a large number of industrial workers to the east beyond the Urals and the development of new lands there helped greatly to meet the situation. Lend-lease shipments were used chiefly by the armies and war workers rather than by civilians. Food shipments increased in 1943 as the supplies of munitions became more nearly equal to the requirements of the armies.

In China the people of each region are chiefly dependent on the food produced in that region. Free China lost a large part of its best land. Many refugees crowded into Free China, but most of the millions remained where they had lived and gleaned

a subsistence from the earth. The poor distribution system was taxed to the limit to supply the armies and war industries. Another difficulty was inflation, which made it almost impossible for many to buy sufficient food.

In India the famine in Bengal and Calcutta was the result of poor crops, lack of transportation, inflation of prices and the steady growth of population compared with food production. While the loss of the rice imports from Burma was serious it was not the principal factor. The fear of Japanese invasion led producers to hoard their limited supplies, and the refugees in towns and cities were unable to buy food at the high prices. There had been a part of the population on the margin of starvation at all times, and despite imports of food by the government there was constant malnutrition. (*See* also FAMINES.)

The food shortages in the invaded countries were not well known in 1943, but enough information came from all of these countries to indicate that the mass of the people were living very near to the lowest margin of existence. This meant in general terms that about one year's supplies would be needed to re-establish a normal food supply. Such a large amount could not be provided at once by the surplus producing countries but had to come from restored production within the areas plus such surpluses as could be shipped in from the distant parts of the world.

The axis countries, Germany and Italy, and most of the invaded countries in Europe had their agriculture at a high state of development in 1939 when the war started. Germany was close to 90% self-sufficient, Italy 80%, with its colonies, and the other European countries were in better status than for a generation previous. Every effort was made by the Germans to keep up farm production, and there were excellent crops in 1942 and 1943. Continental Europe as a whole produced about 90% as much food in 1941–42 as before the war, and the people were getting about four-fifths of prewar diets according to estimates by the U.S. department of agriculture. While livestock numbers were reduced from 10% to 25% in those areas dependent upon imported feedstuffs, there was not the wholesale slaughter that some early reports indicated.

The rationing systems in the several countries were set up to favour the armies and the essential workers over others whose health was less essential to the war effort. Many of the poorer classes were reduced to mere subsistence, and there were many deaths from malnutrition. The deaths in Greece and Poland were the result of the removal of food as an instrument of war, rather than of a shortage in production. The farmer-peasants in all of the invaded countries remained on their farms to a large extent. While they lost their stored stocks and some of their animals to the invaders they were able to keep up a good degree of production in the areas distant from the main highways where the armies travelled. Even in the Ukraine the farm tractors were removed eastward in advance of the German armies; livestock was shipped and seed stocks thereby protected. As quickly as the areas were rescued by the advancing Russian armies the farmers resumed operations. While more farmers were disturbed in World War II than ever before in modern times, on the whole the rural population remained as it was before the invasion. Able-bodied men were forced to follow the armies, but 70% to 90% of the farm work on eastern European farms is done by women and children in wartime.

The detailed estimates of postwar relief needs by 1943 had been constantly revised downward from the first calculations made in 1941 and 1942 before the organization of the United Nations Relief and Rehabilitation conference at Atlantic City in Nov. 1943. These revisions were made necessary by the fact that available supplies were not in view and also because crop production in Europe continued at a fairly high level in 1942 and 1943. The need was expected to depend, to a considerable extent, on the time of year when hostilities ceased and it became possible to send food supplies into the various invaded countries.

United States agricultural policy had not been changed in 1943 to take the relief need into consideration except as represented by lend-lease requirements, but the subject was being closely studied. As early as 1941 some private organizations had begun to agitate for a special campaign of production of foods to be stored and held for relief purposes, but the difficulty of meeting these current needs prevented action in this direction. Some groups were planning animal breeding in anticipation of the needs of Europe after the war and a beginning was made in some localities. Air Conditioning. In the United States, where most air conditioning equipment is produced, the wartime controls were further strengthened in 1943 to insure that air conditioning would only be manufactured with a minimum of critical materials and installed in applications that would directly help the war. This result was achieved by requiring individual and detailed application for priority assistance and permission to purchase through the War Production board.

Comfort air conditioning sales and installations were non-existent except for a relatively small number of individual room coolers manufactured in 1941, which were released from "frozen" inventory after the armed services had purchased all they required.

Refrigeration machinery in a number of large air conditioning systems in department stores and government buildings was removed, reconditioned by the manufacturers and installed in war plants, for industrial refrigeration and air conditioning applications.

The refrigerant Freon-12 which is almost exclusively used in all air conditioning systems, except for the largest systems utilizing centrifugal compressors, became critical in supply in 1943 due to its use in a new insecticide, aerosol, developed for the use of the armed services. This required some systems to shut down although many systems were converted to use the refrigerant methyl chloride.

Nonmilitary applications of air conditioning continued in new black-out plants; in precision manufacturing, assembling and testing; in the storage of vital materials, tools, dies and instruments; in research and development laboratories, especially of the "stratosphere" type; and in the processing of foodstuffs.

Military applications increased as a result of the severe requirements in the hot climates of Africa and the South Pacific. Some of the principal applications were bombsight storage, repair and calibration; in special buildings for celestial navigation training; in Link-Trainer buildings; for the storage of wool and fur flying suits; in parachute drying and storage; in airport control towers; aeroplane engine test buildings; photographic development rooms and mobile units; and radar rooms; powder magazines; ready-rooms for aviators and other special applications aboard ships; also, in armament instrument inspection and adjustment; in armament fire control buildings; plotting rooms; operating rooms and convalescent rooms in military hospitals, hospital ships and hospital cars; portable food refrigeration units.

Stabilization to wartime conditions permitted some manufacturers to start postwar plans for air conditioning. (*See* also PUBLIC HEALTH ENGINEERING.) (F. H. F.)

Aircraft Carriers: *see* AIR FORCES OF THE WORLD; NAVIES OF THE WORLD.

Air Forces of the World.

U.S. Army.—The U.S. army air forces became, in 1943, the greatest air arm in the world. Nearly all its objectives for the year were realized or surpassed. The 15th air force was added to the 14 already established and committed to battle in the Mediterranean theatre. By December, A.A.F. personnel numbered in excess of 2,300,000, an approximate increase of 1,000,000 over the preceding year.

Several significant changes, tending to make the A.A.F. a more cohesive unit, took place during 1943. In March, a complete streamlining of the headquarters organization, on a functional basis, was effected. The coequal status of air power with land power was established in July. This recognized the principle of the concentration of aircraft as a striking unit, under the theatre commander, as opposed to its dissipation in small operations. It facilitated the further development of the strategic and tactical concepts of air warfare. In October, authority was procured to integrate into the A.A.F. all military personnel attached to it from other arms and services of the army.

Combat operations during the year increased greatly in size, scope and effectiveness. Losses were never out of proportion to the damage done to enemy objectives, nor were they sufficient in any single case to turn our bombers back from their objective. The German air force was forced to abandon its offensive tactics and to concentrate on defense against our bombardment. The industrial potential of axis-occupied Europe was reduced by effective precision daylight bombing missions against aircraft plants, oil refineries, bearing plants, rubber factories and numerous other war industries. The bombardment of Pantelleria became a milestone in aerial warfare when that island surrendered to Allied airmen on June 12. The ever-growing importance of air power in tactical operations was evidenced by the co-operation given to ground forces in the establishment of the Salerno beachhead and the drive up the Italian mainland. American airborne and parachute operations met with signal success in the invasion of Italy and the investment of Lae, New Guinea, in September.

Several new aeroplane types were put into production during 1943. Many modifications to increase range and effectiveness were made on those in use to meet changing combat conditions. By such modifications, the army air forces everywhere maintained qualitative superiority over enemy aircraft. American pilots in various theatres destroyed from 2 to 9 enemy aircraft for every one lost in combat during the past year.

The strategic bombardment of the enemy by the U.S. army air forces proved the validity of two basic operational principles: It is feasible to conduct precision daylight bombing operations against selected military or industrial targets despite the anti-aircraft artillery and fighter defenses of the enemy. Presently developed aerial bombs can destroy or render unserviceable any enemy industrial installations essential for the conduct of war. None of the innovations and new tactics attempted by the enemy during the year could disprove these two principles. (H. H. A.)

U.S. Navy.—In Jan. 1943, the grave news was released identifying the aircraft carrier which had been sunk in the battle of Santa Cruz on Oct. 26, 1942, as the U.S.S. "Hornet." Its loss, however, was offset by the gratifying achievements of the navy's carrier-borne planes in the invasion of Africa on Nov. 8, 1942. More significant even than its performance was the very presence of naval aviation in the Mediterranean. It cogently demonstrated the expanded scope of the navy's air force since Pearl Harbor.

During 1943, naval aircraft and pilots were found wherever U.S. task forces were operating, whether off Alaska, patrolling our own coasts or striking at Wake, Marcus, Rabaul and the Gilbert Islands.

By Feb. 13, all organized enemy resistance in Guadalcanal had collapsed and on that same day the Corsair (F4U) made its official debut in the Southwest Pacific. This plane has since proved superior to the Jap Zero in every way. The equally fast and deadly Hellcat (F6F) was introduced to the Japanese in the Marcus Island raid of Sept. 1, 1943.

These two formidable fighters greatly accelerated U.S. aerial attacking power in the Pacific and were inflicting tremendous losses on the Japanese, the ratio of their plane losses to U.S. averaging about five to one. In an exceptionally well co-ordinated attack by army, navy, marine corps and New Zealand fliers over Guadalcanal on June 17, 1943, a total of 94 planes were destroyed at a loss of only six for the Allies. In the 37-day Munda campaign—June 30 to Aug. 7—358 Japanese planes were destroyed to the loss of 93 U.S. planes. Navy and marine corps planes composed about two-thirds of the air power employed. U.S. planes dropped tons of bombs on Wake and aided the fleet and marine landing force in capturing Tarawa.

Perhaps most sensational was the achievement of U.S. carrier-based units in two November raids on Rabaul. On Nov. 5, six heavy enemy cruisers were knocked out, and two light cruisers and two destroyers were torpedoed or bombed. Six days later U.S. airmen came back, sinking a Jap light cruiser and two destroyers and damaging 11 other destroyers.

More and better planes, aircraft carriers and advance bases made naval aviation daily more menacing to the enemy. On March 16, 1943, Admiral Ernest J. King, commander in chief of the fleet, became chairman of a conference of American, British and Canadian officers held in Washington to formulate means of combating German submarines. One method adopted was the use of small aircraft carriers to patrol convoy lanes too remote for land-based planes to guard. Naval aviators of one of the baby flat-tops attacked 14 submarines and sank at least three, although it is probable that nine subs were sunk by that carrier. Planes from another baby flat-top played a vital role in the taking of Attu from the Japs in May 1943.

In July, Rear Admiral John Sidney McCain, chief of the bureau of aeronautics, was promoted to vice-admiral and appointed Deputy Chief of Naval Operations (Air). Rear Admiral DeWitt C. Ramsey was named chief of the bureau of aeronautics. The change was designed to better correlate and co-ordinate all operational phases of naval aviation, leaving with the bureau of aeronautics the job of continuing to design, procure and maintain the finest planes and aircraft equipment for the specialized work naval aviation has to perform.

At the outbreak of World War I, naval aviation had 54 planes, 31 pilots and 163 enlisted men. When Pearl Harbor was attacked 5,420 officer aviators and 806 enlisted pilots comprised the navy's air arm. At the end of 1943, naval aviation had grown to 30,000 pilots and 27,500 planes. (J. S. M.)

The World.[1]—The aeroplane of 1942 looked and acted much the same as had its predecessors of 1940 and 1941. At the end of 1943, a similar statement can be made. Improvement of design detail had been continuous. The fighters and bombers of both sides were better military machines at the end of the year than they were at the beginning of the year. But nothing radical

[1]All assertions or opinions contained in this section of this article are the private ones of the writer, and are not to be construed as official or reflecting the views of any organization or government service.

enough to guarantee air superiority by the United Nations or the axis put in an appearance during the year 1943.

There were hints here and there that by another year the situation might be changed. Research projects that were initiated in the first year or two of World War II were beginning to bear fruit.

Germany went to war in 1939 only after she was satisfied that her aircraft production and her aviation reserves were adequate for the job to be done. The program, big as it was, contemplated a war of relatively short duration. Research never stopped, but new developments were put on shelves until needed. After it became evident that the war would not be over in 1941, a period of intensive research was inaugurated. This was made coincident with a great retooling program designed to permit the modernization of the luftwaffe by 1943, doubtless impeded seriously by the bombings of German production centres in the summer and fall of 1943. It seemed probable, however, that from plants hidden deep in Germany, would come a new series of planes of radical design, the offspring of wartime research. The spring and summer of 1944 should reveal the secret weapons on which Hitler might be counting for a last desperate effort.

But meanwhile, anti-axis air people had not been idle. When war came, British research activity lagged behind the German. Active air forces were inadequate to meet the attack. Following the destructive raids of 1940–41, and the terrific losses at Dunkirk, production was paramount, development had to wait. Once factories were decentralized and reconstructed, and after lend-lease began to furnish some relief to the hard-pressed British industry, engineering and technical talent again became available for research and development. The results would doubtless show up in service aircraft in 1944, to meet whatever new threats German science might have developed.

As the year closed, came the first public hints of the nature of some of the expected surprises. It had long been known that all first-rate aeronautical powers were experimenting with rocket or jet types of propulsion. The veil of secrecy, heretofore drawn tightly about all such projects, was lifted a little in 1943.

Rocket-driven missiles are not entirely new. There are records of early use against besieged cities. The modern counterpart is the anti-tank "bazooka." In 1943, rocket bombs were fired from aeroplanes. The Russians used them effectively against ground forces from the Stormoviks, and latterly the German fighters, on the defensive against U.S. and British heavy bombers, were so equipped. These were true rockets, containing a propellent in the tail which was ignited to develop a high velocity jet of burning gases to drive them. When the charge was exhausted, the projectile fell to earth.

This type of rocket engine had only limited application to full-size aircraft, so far. Short-time, high intensity jets might be used to give extra thrust at take-off to help get heavily loaded aeroplanes into the air. There was some indication that the Germans used this method to launch bombers. It was also possible to utilize the power of such jets to give momentary extra performance in flight. For example, a fighter pilot in a tight spot might touch off a rocket thrust augmentor to get away from, or to overtake, an enemy plane. The extra push is short lived, however, as the amount of fuel that can usually be carried for such purposes is quickly exhausted.

The so-called "sustained jet" type of propulsion was the novelty announced in the press at the end of the year. It replaced entirely the conventional engine and propeller combination. This type of aeroplane was built around an open-ended tube. Air is sucked in at the forward opening, compressed in a blower of some sort, heated by engine exhaust gas or by open gasoline burners, and blown out the stern opening. The reaction to the hot air blast provided the thrust to drive the plane forward.

The first public disclosure of this type came in 1941 when the Italian-built Caproni-Campiani CC-22 flew from Milan to Rome. Its performance was not impressive, but it proved to be a prototype for later development.

How far the British and the Germans had actually gone was in 1943 a closely guarded secret. It was known that machines were extensively test-flown both in England and in America. The Bell Aircraft company of Buffalo announced its collaboration with the General Electric company on the application of the British Whittle engine. There was reason to suspect that German jet-driven planes had been observed in flight, but whether any had fallen into Allied hands was unknown. There was intensive activity on both sides, and the chances were that before 1944 ended some extraordinary speeds at high altitudes would be possible.

The general trend toward increasing the fire power of all fighters continued during the year. More and more 20-mm. cannon were carried by British Hurricanes and Spitfires. Rumours of 40-mm. were heard. Some sources indicated that German experimental installations of 70-mm. cannon had been identified. In view of the announced arming of a U.S. Mitchell bomber with a 75-mm. cannon, such enemy installations did not appear improbable.

The practice of arming fighter aircraft with sizable bombs also continued in development. The application was somewhat limited, but most 1943 fighters carried a belly bomb rack, sometimes two wing racks. For ferry work, or for long range bomber escort missions, auxiliary fuel tanks (dropped when empty) could be carried in the bomb racks.

Apart from the above, little else in the realm of radical technical development turned up. Tactics changed, and operations of all kinds were intensified, but these were matters of degree rather than of novelty.

It was impossible to estimate with any accuracy production rates and numerical strength of opposing air forces. The interpretation of losses, reported from several sources, and the evaluation of the effects of material shortages and of bombing on production were equally difficult.

By the end of 1942, it was generally conceded that Allied aircraft production had surpassed the axis effort. If that was true, then 1943 certainly widened the gap with a phenomenal U.S. and British aircraft output matched against Hitler's shrinking and bomb-shattered industry. It appeared probable that the bulk of 1943 German production was of fighter types. Since the initiative in the air was lost in 1942, fewer bombers came from the factories of the reich. The need was for interceptors to beat off British and American bomber attacks.

What was probably a reasonably accurate estimate of aviation losses came from a British source. The total score for the European theatre of operations (excluding the Russian front) for the war up to mid-Dec. 1943, is as follows:

	Axis	Allied
Aircraft destroyed in combat or by AA gunfire	18,785	12,706
Personnel*	31,328	52,092

*Note that Allied losses of men are higher than for the axis. This is on account of the increased use of big bombers where crews average 8 to 12 men each.

Trends in current enemy aircraft design are established from examples that fall into Allied hands, and from aerial photographs taken in combat and on reconnaissance. Up to the close of 1943, there had been no marked indication of deterioration either in design or in matériel in captured equipment, German or Japanese. Fuels and lubricants were still first class. Metals and other materials of construction were generally as good as those of the

FLYING FORTRESSES returning from a mass U.S. raid on Stuttgart, Germany, Sept. 6, 1943. One of the engines of the plane from which the photograph was taken is dead

Allied nations. There was a hint of experimental wood construction in Germany, as a possible indication of shortage of light metals.

The following notes on various models in use by the several air forces are not complete. They are intended to give a brief survey of the newer types that came into combat use during the year 1943. Older types are listed and newest improvements noted.

THE AXIS POWERS

Germany.—The war communiqués of 1943 carried only names of German aircraft familiar in the reports of 1941 and 1942. Over Regensburg, Marienburg and Schweinfurt, the fighter swarms were Messerschmitt Me-109's and Me-110's, and Focke-Wulf FW-190's. Constant improvement of all these types was in evidence—higher speed (they all do about 400 m.p.h. at altitude), more fire power (cannon and rockets), and heavier armour. The Me's continued to use liquid cooled, direct injection inverted Vee engines (in 1943, rated at 1,350 h.p.); the FW's, twin-row radials, air cooled (about 1,750 h.p. at 18,000 ft.). Simplicity of design and rugged construction marked all recent models.

One trend for future fighters showed up in the Me-210. This was a compact monoplane with small central fuselage, powered with two nacelle-mounted DB-601 engines of 1,270 h.p. each. Pilot and gunner sit in a streamlined "greenhouse" high on the nose. Both engines and both cockpits were heavily armoured. Two 7.9 machine guns and two 20-mm. cannon were fitted in the nose. There was provision for a medium-sized bomb (500 lb., estimated), also in the nose. Most interesting armament feature was the mounting of two guns (approximately 50 cal.) in small remote-controlled "barbettes" on either side of the fuselage, for side and rear protection. All up, the Me-210 weighed over 21,000 lb. Its speed at 18,000 ft. was about 370 m.p.h. Rumours indicated that certain structural troubles cut production of this model short, but that a revised and improved design, the Me-410, of substantially the same type replaced it. The probabilities were that the 410 would carry guns of high calibre, 37 mm. or even larger.

Another high altitude fighter-bomber of somewhat similar pattern was described, the Junkers Ju-86P. It was said to have supercharged cockpits. Power plants were the Junkers Jumo diesel, with exhaust driven superchargers. It was well armed and armoured, and could carry a 2,200-lb. bomb.

The old Ju-87 (Stuka) dive bomber was modernized, and was in service in 1943. Its Jumo 211 engine was stepped up to 1,300 h.p. At a gross weight of 14,300 lb. it could manage 4,000 lb. of bombs for short ranges. Reports indicated that it was fitted experimentally with a 37-mm. cannon.

In early 1943, a large bomber appeared at extremely high altitudes over England. This was later identified as the Heinkel He-177. It was reported to be capable of carrying some 2,000 incendiary bombs, or a single 7,700-lb. "block buster." The crew consisted of seven or eight. Defensive armament was provided by 11 machine guns. Notable feature was the mounting of four 1,000-h.p. engines, each pair coupled to a single large propeller.

Only other large bombers in use at the close of 1943 by the luftwaffe appeared to be the Junkers Ju-90 and the Focke-Wulf FW-200 Kurier. Both were 4-engine machines of prewar vintage, modernized. They were used mainly for long-range bombing of convoys at sea.

The famous Junkers Ju-88, and Dornier Do-217 types were in service in improved models. The FW-189 twin-engine fighter that appeared early in 1942 was reported as widely used on observation missions on the Russian front.

One new ground attack type was identified, the Henschel Hs-129. It was probably under-powered, with its two 450-h.p. Argus air-cooled Vee engines. It carried a battery of machine guns and a 15-mm. or 30-mm. cannon under the fuselage. The under-part of the plane was well armoured for protection against ground fire.

Most novel development of the year was the appearance of extremely large powered glider transports. The usage of towed gliders was apparently abandoned in favour of the powered types. The older Gotha 242 twin-tail boom cargo sailplane used in Crete and in North Africa, came out with two small 14-cylinder radial engines (800 h.p. each) fitted in wing nacelles. A tricycle type undercarriage replaced the former belly skids. The rear portion of the body opened up as a door to permit loading. Loaded to its limit, the machine might require assistance for take-off, but once in the air, would be flyable on its own power.

The largest machines of the power glider type ever built were the Me-323's, powered version of the Me-321 glider, which were used to carry troops across the Mediterranean and were shot down in large numbers by U.S. and British fighters. These large and unwieldy machines had a span of 181 ft. and were 93 ft. long. A ten-wheeled landing gear was built directly into the bottom of the fuselage. The latter was of very large cross section, about 10 ft. wide and 13 ft. deep. A three-ton truck, a light tank, or up to 120 men could be loaded. Large doors in the nose and tail gave access to the interior. The two pilots sit in an armoured

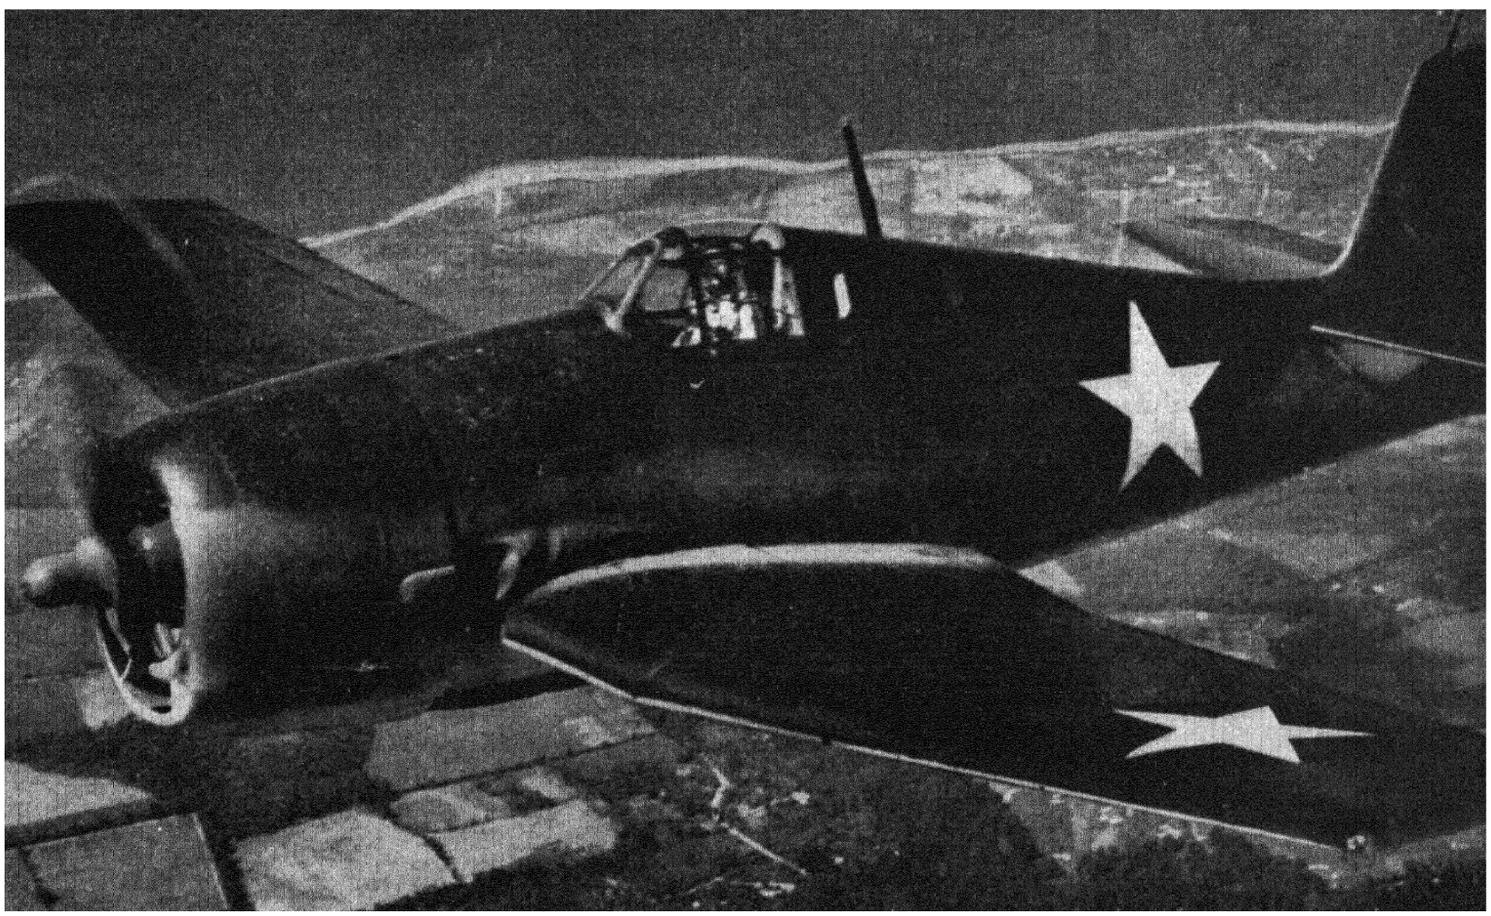
cockpit high on the nose. Power was furnished by six Gnôme-Rhône 14-cylinder engines of 965 h.p. each, strung out along the leading edge of the wing. Chances are that, when loaded to its maximum (about 40,000 lb.) some assistance for take-off, either by towing or by rockets, was necessary. Construction was of steel tube, wood and fabric.

The Blohm and Voss 222 6-engine flying boat appeared occasionally in 1943. It was used as a long range reconnaissance plane or as a troop transport. For the first mission, it was said to have a range of nearly 4,500 mi. As a transport, it could carry 80 men and their equipment, disposed on two decks. For protection, it carried three power-driven gun turrets along the top of the hull. In appearance, it resembled the big Short Sunderland of the British coastal command.

What use the Germans made of the captured French aircraft industry was not entirely clear. The factories which had not been dismantled and transported into Germany were probably employed on supplying parts for German production. One or two large planes, designed and started prewar, were reported to have been completed and flown. In this group was the Farman 2234, a 55,000-lb. civil transport with four Hispano-Suiza 12-cylinder X-type engines. Generally speaking, however, the French aircraft industry appeared to have lost its identity.

Italy.—Before capitulation, Italy contributed very little to the axis air effort in 1943. Italy's main manufacturing plants had been bombed to the point of minimum enthusiasm for production. Early in the year, a pair of reasonably good single-seater fighters appeared, the Reggione Re-2001 and the Macchi C-202. The former was a small machine (36-ft. span) powered with a DB-601 German engine. It carried two 50-cal. guns in the nose and two 30's in the wings. Top speed was about 350 m.p.h. The Macchi C-202 showed strong German influence throughout. The resemblance to an Me-109 was strong. With a DB-601 engine, it was good for about 330 m.p.h.

Savoia-Marchetti turned out a big 3-engine (Alfa Romeo 128, 950 h.p.) troop transport that was used in North Africa. It was of the usual Italian mixed steel-wood-fabric construction. It grossed 38,000 lb. and had a speed of 230 m.p.h.



One big 4-engine bomber appeared, the Piaggio P-108. It was powered with four P7RC35 engines of 1,350 h.p. each. Top speed was about 290 m.p.h. Most interesting feature was cabin supercharging for high altitude use.

Two or three twin-engine seaplanes of conventional design were seen in the Mediterranean as torpedo carriers. The Fiat RS-14 grossed 16,000 lb., was powered with two 870-h.p. engines. The Cant 1018 was probably the most modern of the lot. It was used mainly for reconnaissance or as a medium bomber. The Savoia-Marchetti SM-84 carried two full-size naval torpedoes. It was powered with three Alfa Romeo engines.

Japan.—The fighter pilots of the Japanese army and naval air services proved tough opponents. They fly with a blind acceptance of orders which makes them dangerous. In groups under skilled command, they do well. If flight commanders are shot down, and flights disintegrate, individual pilots, left on their own, show lack of initiative and inability to cope with circumstances beyond their original orders. Naval pilots seem better trained, more resourceful than their army counterparts. Most of the action in the South Pacific was fought by naval air units with land-based army groups in support.

The work of the Jap torpedo and low-level bombers was excellent. Their high altitude bombing was far less accurate than that by U.S. fliers. Reconnaissance and patrol effectivity over long ranges at sea was high.

NEWEST AND DEADLIEST of the U.S. navy's fighters in 1943, the Grumman "Hellcat" made its battle debut Sept. 1, in the raid on Marcus Island. The "Hellcat," successor to the navy's famous "Wildcat," was designed from specifications made by combat fliers

HEAVY BOMBERS of the U.S. 8th air forces streaming through the upper air, trailing vapour plumes on their way to bomb Bremen Nov. 26, 1943

The Japanese aircraft industry showed unexpected strength in its ability to turn out machines with constant improvements at high rates of production. No accurate figures were ever tabulated on the extent of the Japanese aircraft industry, or of its output. Putting together information from German, Italian and American sources, by 1941 there were at least 17 major aircraft manufacturing plants in Japan proper. It was estimated that the capacity of these factories was between 500 to 1,000 units a month.

During the four or five years prior to the outbreak of the war, Japan acquired a large number of licences to manufacture European aircraft and accessories, including Italian Fiat bombers, German Heinkel and Junkers bombers, and the German Messerschmitt Me-109 and Me-110 fighters. Reports indicated that the latest German fighter designs, including the FW-190 and the Me-210 were released to the Japanese. It was known that Japanese concerns took licences to build the Swiss Oerlikon and the French Hispano aircraft cannons. But there was no indication of exact duplication of any of these machines. Resemblances existed, but all appeared to have been skilfully modified to meet the requirements of Japanese tactics and production.

In the early stages of the war, Japanese pilots were given little in the way of personal protection. To improve aeroplane performance, extras, such as armour plate, bullet-proof fuel tanks, etc., were omitted. The fanatic fatalism of the pilots favoured such a philosophy of design. During 1943, however, the practical lessons of war resulted in the appearance of armour and protected fuel tanks on newer aircraft. Even body armour was found on shot-down pilots.

The Japanese had a system of designating their aircraft models which tied them directly to the year of manufacture. The two digits which follow the name of any Japanese aeroplane indicate the year in which it was made, not in terms of the Christian calendar, but referred to their own. Thus OO indicates the year 2600 of the Japanese empire, which corresponds to 1940. This is the origin of the designation "Zero" for the Mitsubishi fighter that was reported so frequently in the press.

When the U.S. navy came into daily contact with the Japanese in the Pacific, the 10- to 16-letter words attached to the various aircraft proved too hard to remember, and laid a heavy burden on U.S. communications systems. Accordingly, all Jap planes were described by simple four- or five-letter words—male and female proper names. Thus, "Hamp," "Rufe" and "Zeke" were fighters; "Kate," "Betty" and "Nell," torpedo bombers; "Emily" and "Mavis," flying boats, etc.

"Nate," "Oscar" and "Zeke" were the oldest in the fighter category. The first two saw service in China before Pearl Harbor. They were largely replaced by later types. "Zeke" was best known as the original "Zero." Carrier-based, it was often seen in the Pacific. Land-based, it operated in the Aleutians. One was

captured intact and was extensively studied by U.S. pilots and technicians. It was a small, highly manoeuvrable monoplane of simple but excellent design. Its single engine was a 14-cylinder air-cooled radial. It carried two 7.7-mm. machine guns in the fuselage, and two 20-mm. cannon in the wings. "Rufe" was a modification of "Zeke." The retractable landing gear was replaced by a single float for operation from cruiser catapults.

"Hamp" was an improved "Zero" used widely in the South Pacific from both carriers and land bases. It lacked armour or bullet-proof tanks, but was a dangerous opponent because of its high manoeuvrability and considerable fire power. It was small (36 ft. 6 in. span). With an improved 14-cylinder air-cooled radial engine, it did over 350 m.p.h. at 17,000 ft.

"Kate," "Betty" and "Nell" were torpedo carriers. "Kate" and "Nell" did the damage at Pearl Harbor, and "Nell" sank the "Prince of Wales" and "Repulse." "Kate" was single-engined, carrier-based. It resembled closely the U.S. Douglas TBD. "Nell" was big (82-ft. span) and had two engines. It was supposed to have been developed out of the German Junkers Ju-88, but bore little family resemblance. Top speed was about 230 m.p.h.

"Betty" was a late type, shore-based. It was of the same general size, outline and armament as "Nell." It differed in that a certain amount of armour was installed for crew protection. Also, bullet-proof tanks were fitted. Its main mission appeared to be for high-level bombardment.

"Val I" and "Val II" were in the dive-bomber class. They were single-engine monoplanes with fixed, faired landing gear.

"Sally" and "Lily" were land-based army bombers, both twin-engine, resembling the Martin Maryland. They had deep-bellied bomb bays, and were well protected with mobile guns in turrets fore and aft and below. They were active mainly in Burma and China.

"Dave," "Pete" and "Dinah" were all reconnaissance types. The first was a single-engine twin-float navy seaplane fitted with a few small bombs and with light protective armament. It was fairly slow, 216 m.p.h. at 7,500 ft. "Dave" was obsolete at the close of 1943, having been replaced by "Pete," a single-float, single-engine biplane for catapult use from warships. It was a good performer, with fast climb and an absolute ceiling of over 33,000 ft. "Dinah" was an army model, with two 14-cylinder radial engines. It did about 300 m.p.h. at 17,000 ft. It was used for ground attack against troops.

The transport "Topsy" looked much like a U.S. Douglas DC-2. It was reported as a paratroop carrier in the South Pacific. It had a span of 74 ft. Speed was about 260 m.p.h. at 10,000 ft. Its range with normal load was about 1,200 mi.

Biggest Jap aircraft were "Mavis" and "Emily," both 4-engine flying boats. Their normal mission was for long-range patrol. Without bombs or torpedoes, the range of "Mavis" was said to be over 5,000 mi. "Emily" appeared to be quite similar to the U.S. navy's Consolidated Coronado (PB2Y).

On the other end of the scale were two tiny seaplanes, "Slim" and "Glen," both supposed to be designed for basing on submarines. It might have been one of these machines that dropped incendiary bombs into U.S. territory near Seattle, early in the war.

There was some indication that the Japanese did some glider building. After 1937, the Fukuda Mayeda Light Aircraft works at Asaki were building training gliders of common German types. No usage of gliders in actual service was reported up to the end of 1943.

U.S. FLYING FORTRESSES returning to their North African base after bombing German planes and fuel dumps at Tunis airport, burning in the distance

THE ALLIES

The military aircraft of the United Nations on the fighting fronts were in the same process of slow evolution that characterized axis aviation during 1943. A few new names appeared in British lists, and the Russian picture, although dim in detail, showed a somewhat clearer outline than it did in 1942.

Great Britain.—British aircraft manufacturing staged an almost complete recovery in 1943. Bombed-out plants were running again, often in new and widely scattered locations. What bombing attacks occurred in 1943 were so light that they were not at all disruptive to industry. A high degree of production liaison was maintained with the U.S. Technical and production missions were exchanged to the mutual benefit of both sides. The extent of the recovery could be judged by the ability of the R.A.F. to stage continuous raids of the magnitude of those that wrecked Berlin. Obviously, there was no shortage of planes, personnel or matériel by the end of 1943.

Assistance to Great Britain via lend-lease channels continued on a large scale. Deliveries of practically all current U.S. types were made throughout 1943. The roster of American aircraft in service with the R.A.F., the R.C.A.F. and the R.A.A.F. in various theatres includes:

Fighters:—Bell Airacobra, Curtiss Tomahawk, Curtiss Kittyhawk, Curtiss Warhawk, Grumman Martlet, Lockheed Lightning, North American Mustang, Republic Thunderbolt.
Bombers:—Boeing Fortress, Consolidated Liberator, Douglas Boston, Martin Maryland, Martin Baltimore, Martin Marauder, North American Mitchell.
Dive Bombers:—Brewster Bermuda, Vought-Sikorsky Chesapeake, Vultee Vengeance and Curtiss Helldiver.
Reconnaissance:—Lockheed Hudson, Lockheed Ventura.
Co-operation:—Fairchild Argus, Vultee Vigilant.
Trainers:—North American Harvard, Vought-Sikorsky Kingfisher.
Patrol:—Consolidated Catalina (flying boat).

No new names figured in lists of big British bombers. Little mentioned in 1943 dispatches were the Hampdens, the Whitleys and the Wellingtons that bore the brunt of 1940–41 bombing attacks. These machines were largely replaced by the bigger 4-engine Halifax, Stirling and Lancaster types. These were the machines that carried the "block-busters" to Berlin in night raids. They were big planes (of 99-ft., 99-ft. and 102-ft. wing spans, respectively). Halifax and Lancaster were powered with four Rolls-Royce Merlin XX liquid-cooled engines each. Stirling was fitted with air-cooled Bristol Hercules engines. An alternate Lancaster (II) appeared in 1943 with Hercules engines instead of the Merlins, probably due to the greater availability of the Bristol engines.

In the light, fast bomber category, the Mosquito proved to be the world's best. It was small (54-ft. span). It was powered with two Rolls-Royce Merlin XXI engines of 1,280 h.p. each. Its speed was said to be in the 400-m.p.h. range. It was built of wood, and was in quantity production in Canada as well as in England. It could carry four 500-lb. bombs. As an alternate, fighter armament was four 20-mm. cannon and four .303-in. machine guns. Mosquitos performed brilliant actions over Norway, and made many destructive daylight raids on Berlin.

In the single-seat fighter class, Spitfire and Hurricane reigned supreme up to the close of 1943. Both showed continuous improvement in performance and in fire-power. The Westland Whirlwind (twin-engine fighter) which first appeared in 1942 continued in limited production. Its forte was defensive fighting at night. It carried four 20-mm. cannon in the nose. A new single-engine fighter came into service in quantity in 1943, the Hawker Typhoon. It was designed for high-altitude work as a defense against the FW-190. Its 2,400-h.p. Napier Sabre engine was the most powerful single unit in use in England. Speed was over 400 m.p.h. Armament was either four 20-mm. cannon or 12 machine guns.

The Bristol Beaufighter, evolved from the earlier Blenheim light bomber, figured in 1943 actions both in the European theatre and in the middle east. It fought very successfully against the Italians in the later phases of the Mediterranean campaigns. It was a twin-engine (Bristol Hercules III) two-place machine. It could do over 330 m.p.h. at 14,000 ft. Range was quite good, with reasonable bomb and armament loads. The Bristol Beaufort, also evolved from the Blenheim, figured in many cross-Channel attacks against the axis-held French coast.

For naval use, the older Fairey Fulmar, an adaptation of the prewar Fairey Battle, was in service up to the end of 1943. The old biplane Swordfish continued to appear on carrier decks, although the newer Albacore seemed to be replacing it. A modification of the Spitfire, the Seafire, was put into wide carrier use as a deck fighter. Its characteristics appeared to be much the same as its land-based prototype.

In the big flying-boat field, nothing newer than the Short Sunderland put in an appearance. Its normal gross weight was over 45,000 lb. Span was 113 ft. It was powered with four Bristol Pegasus XXII engines. Speed was 210 m.p.h. at 6,250 ft.

That the British industry was making postwar plans to enter the big commercial transport field was indicated by announcement late in 1943 of the Avro York, a 50-passenger modification of the Lancaster bomber. It was indicated that the commercial version might be produced in Canada.

Russia.—For many years, Russian aviation had been an enigma. A vast activity was suspected, but few people from other countries saw much of it first hand. In 1943, because of somewhat closer co-operation with Americans and British, some facts emerged, but the picture was far from complete up to the close of the year.

It was announced that nearly 7,000 U.S. aeroplanes were delivered to the Russian air force under lend-lease. Curtiss Warhawks, Bell Airacobras, Martin Marauders, Douglas A-20's and North American Mustangs were included. A German source guessed that soviet factories were turning out over 20,000 planes a year. Even if this figure is discounted, the Russian air force was probably of formidable proportions at the end of 1943. That it took the command of the air away from the luftwaffe in the campaigns of 1943 was certain.

Based on reports from a number of scattered sources, it appeared that the Russians had standardized their own production on a relatively small number of basic types. In the single-engine single-seat fighter class, the YAK series (odd numbers) was built around a liquid-cooled Vee engine, the LAGG series was powered with an air-cooled radial type. The YAK fighters resembled the British Spitfire or the U.S. P-40, with long tapered noses and pilot's cockpit well aft. The YAK-1 appeared early in the war with Germany. Improvements were constant. The YAK-9 was the last reported model in 1943.

The LAGG series resembled the U.S. P-47 (Thunderbolt), although it appeared to be somewhat smaller in power and dimension. The LAGG-3 was similar in design but was said to be built of wood.

Little was known of the armament of either YAK or LAGG. It was a fair guess, however, that they carry both cannon and machine guns comparable to any in use by fighters of the same class elsewhere.

For ground attack and army co-operation, two types predominated—the famous Stormovik (IL-2) and the PE-2. Stormovik was a clean-cut single-engine single-seater of 49-ft. span. The engine was an M-38 12-cylinder inverted-Vee, water-cooled, at 1,300 h.p. It could do 280 m.p.h. at 13,000 ft. It was characterized by fairly thick tapered wings with two large bulges below to house the undercarriage. It normally carried two 32-mm. cannon and four machine guns in the wings. Alternately, it could be

fitted with bombs or rockets. It was heavily armoured against ground fire.

The PE-2 was a twin-engine type resembling the Messerschmitt-110 and -210. It was used either as a fast reconnaissance or a dive bomber. For the latter purpose it was fitted with "venetian blind" diving brakes. Engines were liquid-cooled, M-105 Hispano-Suiza, 12-cylinder Vee type of 1,100 h.p. each. Span was 60 ft. It carried a crew of two or three. Top speed was around 300 m.p.h. The PE-2B was similar to PE-2, but was fitted out as a fighter with a heavy battery of cannons and machine guns in the nose.

In the medium bomber field, the Russian DB3F compared with the U.S. B-25 Mitchells. It was similar to the machine (ZKB-26) that flew non-stop from Moscow to Miscou Island (New Brunswick) in April 1939. It was a midwing monoplane with two liquid-cooled M-88 engines of 1,100 h.p. each. Armament consisted of 7.6-mm. or 12.7-mm. machine guns. A considerable bomb load (two tons for relatively short ranges) was carried. These were the first soviet aircraft used to bomb Berlin.

The big 4-engine DB-7's designed by Tupelov were reported to have engaged in several raids against Berlin, Danzig and the Balkan cities early in 1943. They were said to have up to 8,000 lb. as bomb-load for long ranges. The type was characterized by very large inboard nacelles. Each housed a landing gear unit, and the radiators for both outboard engines. A machine-gun position was located in the tail of each of the larger nacelles. A crew of nine was carried. This machine compared in size with the U.S. Consolidated Liberator. (*See* also AIRPORTS AND FLYING FIELDS; AIR TRANSPORT COMMAND; AVIATION, CIVIL; BUSINESS REVIEW; MUNITIONS OF WAR; WORLD WAR II.) Airports and Flying Fields.

The U.S. tradition is to build for peaceful commerce instead of for war, but to so build public facilities, particularly those federally created or aided, that they can be converted quickly and easily to military use when the national safety is imperilled.

Airport construction in 1943 was primarily aimed at satisfying the needs of the armed forces; however, the understanding reached between the federal and city governments was to enable the latter, at the same time, to develop plans which would make it possible to adapt military airport facilities to the needs of postwar commercial aviation.

Many military airports are not suitable for large communities, primarily because they are so far from these communities. Yet, in instances where postwar airport development is possible, plans were being made to enable municipalities to continue airport construction in a manner suitable for efficient and economical operation of civilian air transportation. It was not to be expected, however, that the air forces would leave a large number of newly equipped airports for commercial use after World War II. Here are some of the reasons why:

1. Many military airports are too distant from cities to be suitable for scheduled air line use.
2. Many military airports are designed primarily for mass formation flights; therefore, in their present state, these are unsuitable for economical civilian use.
3. The very nature of commercial airports requires a higher factor of safety and they must of necessity be designed accordingly.
4. Point three will determine, therefore, the location of building areas which in the case of army airports are widely dispersed for the purpose of protection, etc.

Existing air line companies however, were expected, at the close of World War II, to increase their facilities to several times the prewar standing. Numerous feeder line services would be franchised; the much-talked-about air freight services would quickly add considerably to airport traffic as adequate cargo planes came to hand. New land-based transoceanic services would be inaugurated; many progressive industrial concerns would conduct business by air with their own multi-engined aircraft. All these various services must be adequately accommodated at major air terminals.

The ultimate facilities should simulate, to a greater degree, those used for railroad passenger terminals as well as transoceanic passenger accommodations, and also, to some extent, provide freight service facilities until such time as increased business makes the building of separate air freight terminals necessary.

Redesign of Transport Airports for Increased Efficiency.—The air liners of the U.S. make several hundred thousand landings and take-offs each year. The length of runways, position of taxiways, approaches and other factors of design cause excessive wear and tear on flying equipment that adds materially to the maintenance and overhaul costs.

A majority of the transport airports in 1943 had an average runway length of 3,800 ft. and a width of 150 ft. In designing the taxiways, little consideration was given generally to their position with respect to the runway length or the manoeuvring of large aircraft upon the ground. As a result, when a transport plane landed, it invariably rolled past the turnoff point on the landing runway or had to be sharply braked to slow the plane in time for the turnoff.

When a landing aircraft overrolls a taxiway, the pilot must then come to a stop and by using alternate applications of power on his two engines and severe braking, turn the plane through 180°. The 150-ft.-wide runway necessitates a sharp turn with the consequent torque action on the rubber of the inboard wheel.

The average taxiway or runway intersection has rather short radii of turns and the taxiways are rarely over 100 ft. in width. These conditions cause a pilot to bring his ship almost to a stop before he can negotiate the turn off the runway and a series of irregular applications of single engine power to negotiate the relatively narrow taxiway. The lack of identification and guide lights for taxiways and runway intersections causes overroll and excessive braking as well as excessive use of the engines while landing and taxiing to the ramps during the hours of darkness. These same factors affect the operation of taxiing from a ramp to the runway ends for take-offs.

The additional engine wear and extra gasoline needed for excessive use of engines in ground manoeuvres and the higher degree of wear on brake linings and tires caused by short stops and sharp turns in several hundred thousand landings and take-offs cost the air lines and other operators no small amount each year. The poor location of turnoffs and taxiways seriously hampers the use of each port because of the added length of time it takes a plane to clear the runway for the next landing or take-off.

It would certainly be worth while to investigate each field from the standpoint of efficiency for ground manoeuvres and to press the proper agencies for design corrections to the taxiways, runway widths, lengths and airport lighting.

The growth of private flying and of air transport activities would certainly force the municipalities served by the air lines to provide numerous small airports for private craft and force the building of airports specifically designed for and exclusively used by the air lines.

There were in addition two important problems facing the air transport industry that must also be solved in the immediate future. The immediate need to relieve "stacking" and congestion at large terminals and to provide instrument landing systems at a majority of the fields served by scheduled air transport were too pressing to permit them to continue unsolved.

Federal Aid to Airport Development.—The Airports service of the Civil Aeronautics administration is charged with fostering airport development throughout the United States, its territories and possessions.

This service plans and co-ordinates all civil airport development and correlates these plans with those of the army, navy and other federal agencies. It recommends the allocation and supervises the expenditure of funds appropriated for airport development, and determines the necessity for all other federal expenditures for civil airport development. It supervises and directs the CAA airport program engaged in the construction of public airports essential for the prosecution of the war. It prepares and distributes to federal agencies, states, cities and other civic bodies typical airport plans, designs, specifications and bulletins pertaining to the planning and construction of airports. It reviews civil airport project applications, plans and specifications involving the expenditure of federal money, and processes certificates of necessity for such development in accordance with Section 303 of the Civil Aeronautics act. It collects and maintains current information on all civil airports in the United States. It conducts studies on airport zoning and advises on legal, financial and engineering matters concerning civil airports.

In 1931 the CAA reported to congress that the 2,300 airports in the U.S. should be increased to 3,500 in the succeeding six years, with particular emphasis on the larger type fields. In 1940 it revised this need, on the basis of world conditions, to urge a total of 4,000 fields, stressing particularly the need for major airports in the interest of national defense and proposing a $600,000,000 program in the succeeding three to six years. It requested $80,000,000 for the immediate launching of a program which would be limited solely to landing facilities, omitting buildings and other refinements. Congress thereupon made its first direct appropriation ($40,000,000) to the CAA for airport improvements, limiting them to sites rated as preferentially important by the armed forces. All airports built since were certified as essential to the war effort by the secretaries of war, navy and commerce.

These construction projects were being carried out in any of three ways: (1) by commercial contract, with engineering and supervision by the corps of engineers, U.S. army; (2) by commercial contract, with engineering and supervision by the bureau of yards and docks, U.S. navy; (3) by commercial contract with engineering and supervision by the CAA airways engineering division.

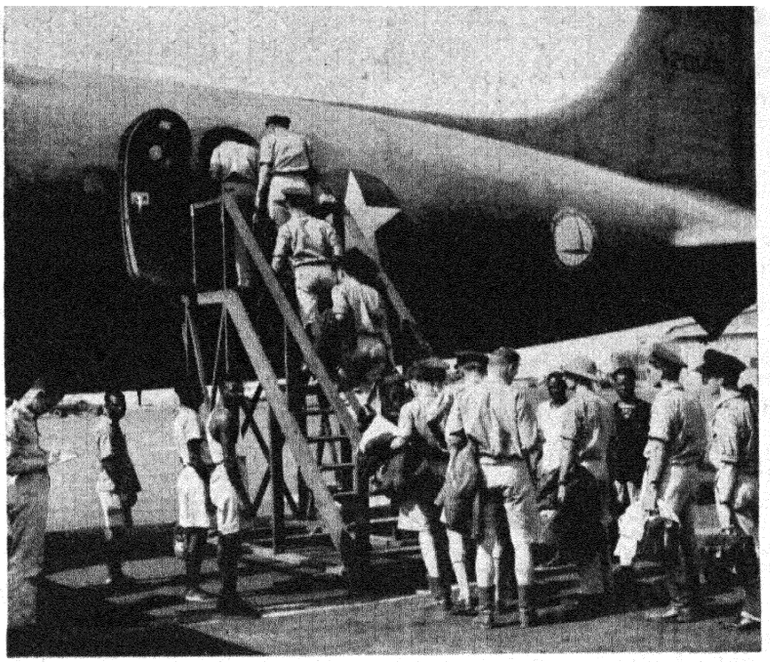
When the CAA received its first airport appropriation, in 1941, there were in all the United States only 76 "major" airports, *i.e.*, fields having paved runways of 3,500 ft. or longer, the types needed by heavy, fast military aircraft. These had been increased at the close of 1943 to more than 850 such fields, in addition to a secret number of purely military air bases.

Snow as an Airport Problem.—Snow can effectively block an airport from income operations while costs go on as usual. Sometimes rolling will make a snow-covered field temporarily usable, but the packed snow has to thaw some time and then it may give with the load. The best solution, when equipment permits, is to melt it or to move it away. Scraping it into piles or windrows makes additional hazards on the field, but when this is absolutely necessary such piles should be adequately marked with flags and lights. These and all other lights on an airport must be kept uncovered and in a constant state of efficiency—which in itself is a considerable job in a snowstorm.

The airport manager, pilot and ground crewmen must always regard snow and freezing weather with suspicion. Loose stones or hard instruments should be removed from runways before a freeze or they may become keen tire cutters when points protrude from a frozen surface. Severe tire damage may also be caused by frozen ruts. Wheel chocks and tools are easily misplaced in bad weather and can become quickly hidden by a covering of snow. Such blind hazards have caused serious accidents when hit by taxiing aircraft. In freezing weather it is the airport operator's responsibility to make frequent checks on the condition of the runways, and to close the airport as soon as it becomes dangerous for use. The retarding effect of soft snow on take-offs may result in normally adequate runways proving too short. Wet snow or splashed slush may freeze in the wheels or undercarriage and cause disaster. Ice and slush create skidding hazards.

No aircraft should be allowed to leave the ground in freezing weather until it is certain that there is no snow or coating of frost, or water which may freeze upon the wings, since the flying characteristics of an aircraft may be materially altered thereby.

Airport Maintenance.—Perhaps this phase of airport management is more important than maintenance of field surfaces, structures and equipment. Practice has shown that there is but one completely satisfactory method of keeping the maintenance program of an airport up to par. The method is based on periodical inspection procedure.



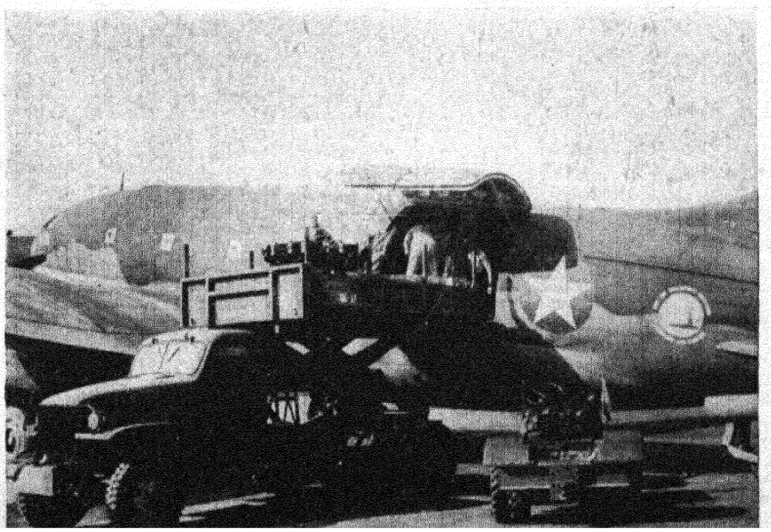
Each superintendent or foreman should be provided with comprehensive report forms covering periodical inspection of all facilities and equipment under his direct charge. The airport budget should always include adequate sums for maintenance and replacement. Neglect of this item will invariably be costly because of the progressive deterioration which neglect brings. Runway surfaces and marking should be watched closely and repaired or painted regularly. Buildings and equipment should be kept in new condition at all times. Lighting, traffic control and similar facilities must be kept in good order for maximum safety of operations. Servicing equipment and personnel must be kept at maximum efficiency.

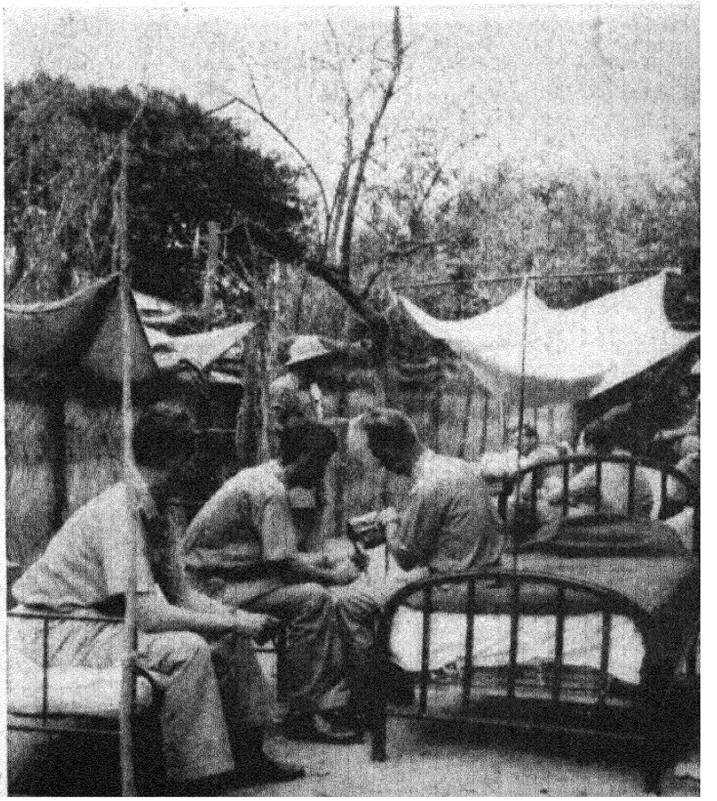
Airport Fires.—Changes in the construction material and size of aeroplanes, and in the size of hangars, have gradually changed the whole problem of fighting fires at airports. All-metal aeroplanes of huge size can have minor fires within their cabins that will not endanger aeroplanes in the same hangar, but if these fires are not quickly controlled by firemen using special portable equipment, the large gasoline loads of such planes will cause fires of an entirely different character. Open fires in hangars are best combated by sprinkler systems of the "deluge" type, which pour down thousands of gallons of water a minute. Still different types of equipment are required for paint shop and gas storage fires.

At Washington National airport, automatic fire fighting is part of the hangar design. The hangar is protected from fire by a "deluge" system which is a sort of big brother to the average sprinkler system. Every 10 feet, large nozzles are installed, and every 40 feet is a pneumatically-controlled switch which opens with a sudden rise of temperature of three degrees in the space of 20 seconds. This provision is to take care of explosions, fires and similar situations. The hangar is divided into areas, and the nozzles in each area are turned on independently. When all nozzles are going, a total of 5,000 gal. of water a minute flood the hangar. (*See* also AIR FORCES OF THE WORLD; AVIATION, CIVIL.)

(E. M. E.)

Air Transport Command. The air transport command is part of the United States army air forces. It was established May 29, 1941, to ferry aircraft for the British from the United States to Canada. It was known then as the ferrying command. On July 1, 1942, the ferrying command was reorganized and renamed the air transport command.





Above, left: OFFICERS entering a giant Skymaster (C-54) cargo plane of the Air Transport Command at a West African base

Below, right: QUARTERS of the Air Transport Command at a servicing outpost in Equatorial Africa

In a military letter under date of April 10, 1943, Gen. Henry H. Arnold, commanding general of the army air forces, set forth the mission of the ATC in these terms:

1. The ferrying of all aircraft within the United States and to destinations outside the United States, pursuant to existing directives.
2. The transportation by air of personnel, matériel, mail, strategic materials and other cargoes for all war department agencies (except those served by troop carrier command units) and for any government agency of the United States or governments of the United Nations, subject to established priorities.
3. The control, maintenance and operation of establishments and facilities on air routes outside the United States which are or which may be made the responsibility of the commanding general, army air forces, or which are assigned to the air transport command, and airports of embarkation for routes over which the air transport command operates.
4. The utilization to the fullest extent possible, both within and without the United States, of the service, facilities and personnel of the civil air carriers.
5. The performance of duties presently performed by the air transport command which were heretofore transferred to it from the military director of civil aviation.
6. The provision of assistance for movements overseas of combat units in accordance with existing directives.
7. The administration of priorities for air travel and the movement of cargoes on aircraft operated by or under contract for the air transport command and on civil air carriers (except as presently administered by the naval air transport service) in accordance with policies and procedures established by proper authority.

Operations of the ATC expanded so greatly in 1943 that miles flown in a single day equalled more than 30 trips around the globe at the equator. Mileage of the command's routes totalled 112,000.

When the command was founded, it consisted of two officers and a clerk. By late 1943, ATC personnel approached six figures.

The late Maj. Gen. Robert Olds, then a colonel, was the first commanding officer. In April, 1942, he was succeeded by Col. Harold L. George, who was made a brigadier general shortly thereafter and was promoted to major general in Aug. 1942.

During 1943, 35 pilots were awarded Distinguished Flying Crosses after each logged more than 1,000 hr. on command flights. Among them, they amassed the equivalent in flying time of four solid years over oceans, mountains, jungles.

The command consists of headquarters in Washington, the ferrying division with headquarters in Cincinnati, the domestic transportation division, with headquarters in New York, and nine foreign wings. These wings are the Caribbean, South Atlantic, Central African, North African, European, North Atlantic, Alaskan, Pacific and India-China. (H. L. G.)

A.L.A.: *see* AMERICAN LIBRARY ASSOCIATION.

Alabama. Alabama is one of the "deep south" states of the United States, admitted to the union 1819. Area, 51,609 sq.mi.; pop. (1940) 2,832,961. Capital, Montgomery (78,084). Cities with larger population were Birmingham (267,583) and Mobile (78,720). Of the state's population in 1940, 855,941 were urban, or 30.2%. There were, in 1940, 1,847,850 whites; 983,290 Negroes; 574 of other races; 2,821,004 native-born; 11,957 foreign-born; 47.2% of the total population was rural.

History.—Chauncey Sparks, Democrat, was elected governor Nov. 3, 1942, to succeed Frank M. Dixon. Eight of the nine congressional representatives, all Democrats, were re-elected. The new representative, from the ninth district, defeated Luther Patrick, the incumbent, in the Democratic primaries run-off election in June. Aside from Gov. Sparks, the principal state officers elected in Nov. 1942 were: Handy C. Ellis, lieutenant governor; Warren C. Lusk, treasurer; John Brandon, auditor; Howell Turner, secretary of state; Joe N. Poole, commissioner of agriculture; and Elbert B. Norton, superintendent of education.

Education.—State appropriations in 1943 amounted to $18,770,631. Total revenues from all sources in 1942–43 were $34,400,044. Illiteracy among whites between 10 and 20 years (1942) was 0.95%, Negroes 5.02%. There are seven state-supported in-

stitutions of higher education for whites and three for Negroes.

Charities and Correction.—The state supports many philanthropic and penal institutions: institutions for the deaf and blind of both races; hospitals for the insane of both races; a school for feeble-minded children; training schools for wayward white boys and girls; a reformatory school for Negro boys, etc.

Banking and Finance.—On Dec. 31, 1942, there were 66 national banks in the state, the same as in the preceding year, and 150 state banks and trust companies, a decrease of one from the 1941 figure. These 216 banks, together with their 21 branches (of which 19 belonged to the national banks), had a capital account of $54,444,000, deposits of $691,828,000 and total resources of $747,396,000. Total net receipts of the state from all sources in the fiscal year ending Sept. 30, 1942, were $102,870,268.66 and total net disbursements were $91,439,096.16.

Agriculture.—The yield of corn, cotton, potatoes, peanuts and tobacco increased considerably in 1943; that of oats and hay declined.

Table I.—*Leading Agricultural Products of Alabama, 1943 and 1942*

Crop	1943 (est.)	1942
Corn, bu.	45,080,000	43,960,000
Oats, bu.	4,182,000	4,800,000
Cotton, bales	950,000	925,000
Potatoes, bu.	5,170,000	3,922,000
Peanuts, lb.	510,675,000	335,400,000
Tame and wild hay, tons	817,000	820,000
Tobacco, lb.	265,000	215,000

Manufacturing.—In 1939, by the federal biennial census of manufactures, there were 2,052 manufacturing establishments hiring 126,215 workers and producing goods valued at $574,670,690. The leading manufactures were cotton textiles (valued at about $92,000,000; spindles in operation, 1,835,909), iron and steel and electricity. Corporation and municipal production of electricity amounted to about 900,000 h.p., and the TVA plants were capable of producing slightly more. There were more than 6,000 mi. of rural electric lines. Other important industries: lumber, blast furnace products, cast iron pipes and fittings, coke oven products, cotton seed oil and meal, paper, aluminum, cement, chemicals, fertilizers, meat packing and shipbuilding. War demands caused expansion of old industries and the rise of new industries, such as powder, aluminum and chemical manufacturing in 1941 and 1942.

Mineral Production.—The total value of Alabama's mineral production in 1939 was $54,124,382; in 1938 it was $46,296,293.

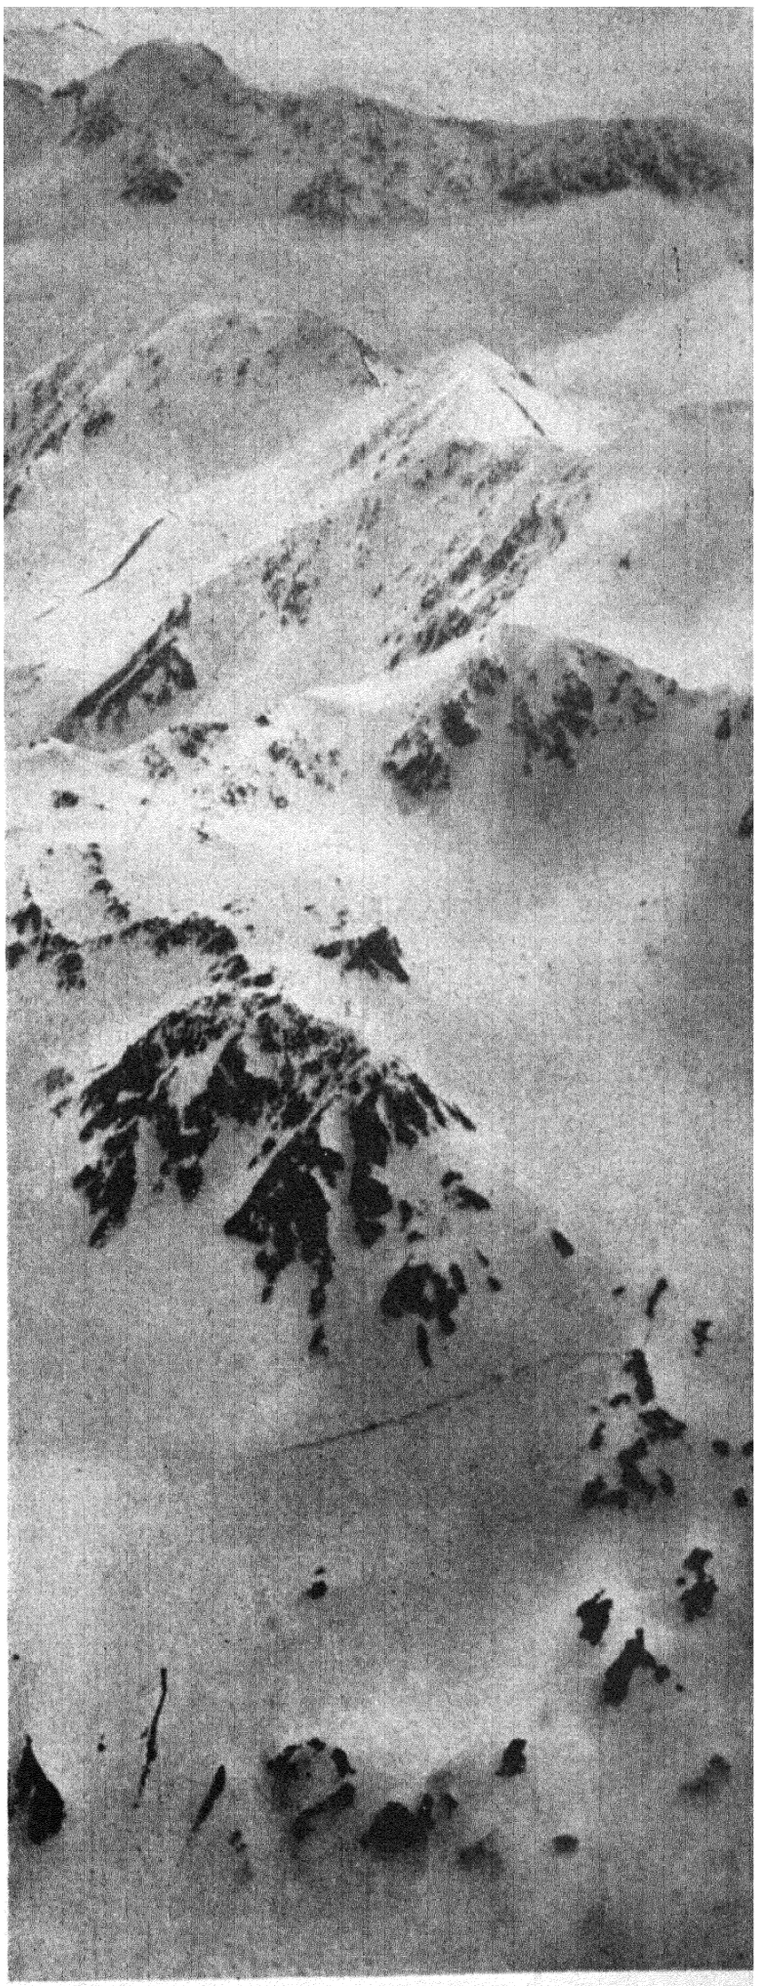

Table II.—*Principal Mineral Products of Alabama, 1939 and 1938*

Mineral	Value, 1939	Value, 1938
Pig iron	$43,902,681	$29,190,091
Coal	27,708,000	26,769,000
Coke	10,917,559	9,888,292
Iron ore	9,971,024	7,341,620
Cement	6,690,765	6,114,246
Stone	2,516,584	1,809,379
Clay products	2,306,712	1,487,067

(A. B. Mo.; X.)

Alaska. Alaska is one of the two incorporated territories of the United States. Area, 586,400 sq.mi., approximately one-fifth the area of the 48 states. The territory lies between the meridians 130° W. and 173° E. longitude and between the parallels of 51° and 72° N. latitude. The civilian population of the territory (72,524 in the 1940 census as against 59,278 in 1938) was estimated to have increased in 1943 to approximately 90,000.

History.—In 1943 the U.S. army drove the Japanese invaders

BLEAK MOUNTAINS through which U.S. forces filed to attack Japanese positions on Attu Island after their landing on the tiny Aleutian outpost May 11, 1943

MIDGET SUBMARINES blown up by the Japanese before they evacuated Kiska in Aug. 1943

from Alaskan soil. On May 11, American forces landed on the Aleutian island of Attu, held by the Japanese since June of 1942. Desperate fighting continued throughout the mountainous island until the morning of May 29, when final large scale Japanese resistance was crushed. Few prisoners were taken, practically all of the 2,300 Japanese having been killed during the heavy fighting or having died in mass suicides undertaken when the Japanese cause became hopeless. In August a strong U.S. and Canadian force landed on Kiska, which had been the most strongly defended of the Aleutian islands held by the Japanese, to discover the invaders had abandoned the island. (*See* also WORLD WAR II.)

The Alaska highway, first overland transportation route between Alaska and continental United States, was dedicated in Nov. 1942, and during 1943 carried a heavy volume of military traffic. Also during 1943 there was intensive development of the Fort Norman oil fields in northwestern Canada, and under the direction of the U.S. army a pipe line was constructed from the oil fields to Whitehorse, where a refinery was being built. Construction of feeder pipe lines to transport refined petroleum products from Whitehorse along the route of the Alaska highway was rushed. In 1943 an additional connecting link of the Alaska highway was provided when under military supervision a road was built from a point on the highway west of Whitehorse to Haines, a seaport in southeastern Alaska. (*See* ROADS AND HIGHWAYS.)

The changed military status resulting from Allied victories in the Aleutians was reflected in the autumn of 1943 when the Alaska Defense Command of the army was abolished and there was set up instead the Alaskan department, operating as an independent unit instead of under the Western Defense Command.

Education.—School enrolment increased slightly in 1943 as compared with 1942, the figures being 5,349 in 1943 and 5,092 in 1942.

Fisheries and Mineral Production.—A very favourable season in the Bristol bay red salmon district was chiefly responsible for the increase in the pack of canned salmon in 1943, the total number of cases for the year being 5,450,000 as compared with 5,075,000 in 1942. Taking of fur seals in the Pribilof islands, suspended in 1942 because of the Japanese occupation of some of the nearby Aleutian islands, was resumed in 1943. Under government supervision, 117,164 seal skins were taken during the 1943 season, constituting an all-time record.

Production of gold, the mining of which had formerly ranked second in commercial importance to fisheries, continued to decline in 1943 under wartime restrictions. (E. L. B.)

Alaska Highway: *see* ROADS AND HIGHWAYS.

Albania, a kingdom in the western part of the Balkan peninsula, occupied in 1939 by Italy. Area 10,631 sq.mi.; pop. (census 1930) 1,003,068; (estimate 1939) 1,063,000. Capital, Tirana. Chief cities: Tirana (30,806); Scutari (29,209); Koritsa (22,787); Elbasan (13,796); Valona (9,100). Religion: Mohammedans (688,280); Orthodox Christians (210,313); Roman Catholics (104,184). Prime minister (1943): Ekrem Libohova.

History.—World War II and the Italian capitulation in 1943 threw Albania into a turmoil, especially because the Allies had pledged repeatedly the restoration of a free Albania. Prime Minister Churchill reiterated this pledge in the house of commons on Nov. 4, 1943, promising an Albania "free from her Axis yoke and restored to her independence." He disclosed at the same time that British officers were co-operating with Albanian guerrillas. The Albanian guerrillas were fighting in three groups, of which the group in the centre near Tirana, under the command of Myslim Peza, was the most formidable. In the north the guerrillas operated under Col. Muharrem Bajraktari, ex-commander in the British-trained gendarmery, while the guerrillas in the south were com-

manded by Col. Bilal Nivica. The Albanian premier, Ekrem Libohova, formerly foreign minister under King Zog, had not been able to popularize the Italian connection. Unrest in the country was generally widespread and increased after Mussolini's downfall.

There existed no Albanian government in exile and Albania was not recognized officially as one of the United Nations. The former king of Albania, Ahmed Beg Zogu, who became King Zog I of Albania in Sept. 1928, left the country at the time of the Italian occupation in 1939 and in 1943 continued to live in England.

Education.—Though primary education is nominally compulsory, illiteracy was still very high in 1943, especially among women. In 1939 there existed 663 state elementary schools with 38,988 male and 17,948 female pupils and 19 secondary schools with 4,810 male and 1,425 female students. There were no institutions of higher education.

Trade and Finance.—The value of the foreign trade for 1938 amounted to $9,644,000. Imports amounted to $6,719,000, of which 37.2% came from Italy and 6% from the United States. The total exports amounted to $2,925,000, of which 68.4% went to Italy and 4.5% to the United States. The major import articles were cotton and cotton goods, corn, benzine and woollen goods; the main exports were wool, hides and furs, cheese, cattle, eggs and bitumen. Of the mineral wealth of the country aluminum and petroleum were of importance. In 1939, 229,278 tons of crude petroleum were produced. With the economic life of the country still on a very primitive level there exists practically no modern industry. Albania has no railroads but a good highway system, improved by the Italians for strategic reasons. The Albanian currency in 1943 was pegged to the Italian currency, an Albanian franc equalling 6.25 lire (32.89 cents U.S., June 1941). The external debt of Albania amounted to $15,000,000 in 1938. (*See* also ITALIAN COLONIAL EMPIRE.) (H. Ko.)

Alberta. The most westerly of the three prairie provinces of Canada (*q.v.*). Area, 255,285 sq.mi.; pop. (1941) 796,169, of which the greater part was rural. The largest city is Edmonton (92,404), the provincial capital. Local administration is in the hands of a provincial parliament. Alberta returns to Ottawa 17 members for the house of commons and 6 senators.

History.—On May 23, 1943, William Aberhart, the provincial premier, died. As he was both the founder and leader of the party in power, the Social Credit, his death was of great political moment. E. C. Manning, formerly minister of trade and industry, was sworn in as premier on May 31. In December, the government carried an important by-election in Red Deer, thus indicating its vigour under the new leadership.

Agriculture.—The wheat yield was estimated in 1943 to be somewhat over 82,000,000 bu.; oats, 10,000,000 bu.; barley, 4,600,000 bu.; flaxseed, 2,300,000 bu. Wartime demands powerfully stimulated cattle raising and dairy farming. In 1943, Alberta led Canada in hog production, while dairy products were expected to reach the record value of $33,000,000.

Mineral Production.—In the first nine months of 1943, 6,443,276 tons of coal were mined, or 3% above the output of the corresponding period last year. The output of petroleum in the first nine months of 1943 was 7,308,669 bbl. Experiments in deep drilling were undertaken in order to expand this output. In 1940, over 26,000,000 cu.ft. of natural gas was produced. (J. I. C.)

Alcohol, Industrial. The military and civil requirements for industrial alcohol in the U.S. increased in 1943. It became evident that all facilities were needed for its manufacture, including those formerly used for alcoholic liquors. From a total requirement of about 175,000,000 gal. in 1941, the need was raised to 356,000,000 for 1942, to about 400,000,000 gal. for 1943 and to 632,000,000 gal. for 1944. At the beginning of 1943 the production capacity was about 490,000,000 gal. and by the end of the year it had increased to nearly 593,000,000 gal. This situation indicated that all production facilities would have to be used during 1944 and also that a large reduction in the stocks of alcohol would be made. These stocks were reported to be 138,000,000 gal. in July 1943 and had been reduced to 80,000,000 gal. by the end of the year. It was estimated by the War Production board that about 40,000,000 gal. more would be taken from these stocks in 1944, bringing them down to the minimum for working reserves. The needs for 1944 were expected to be 50% more than called for in the original program. This made it doubtful that any spirits could be produced for drinking in the year.

The increasing demand came from the synthetic rubber uses, which increased rapidly during 1943. The needs for other war uses had first call on supplies but did not amount to so large a total.

The sources of alcohol were expanded at a rapid rate during 1943 by the increased use of wheat. In 1941–42 only about 2,000,000 bu. were used, in 1942–43 the amount had increased to 54,000,000 bu. and for 1943–44 it was estimated to be 110,000,000 bu. Since the stocks of wheat were so large, the use of wheat was limited only by the facilities. By taking over the liquor-making plants this raw material could be used to a larger extent. The department of agriculture reported that new methods of distilling were being developed which promised to make it possible on a commercial scale to get more alcohol from less malt and also to be able to separate the protein for livestock feed before the alcohol was removed, thus saving it for replacement of corn, which is needed for feed. The protein had heretofore been obtained only from the distiller's slops.

Another prospect for increasing production was in the larger use of molasses from the Caribbean if the imports of this raw material could be increased. The War Production board also proposed that Great Britain resume the making of alcohol from molasses from the Caribbean to replace some of the alcohol heretofore provided under lend-lease arrangements. Many new plants were expected to come into larger production during the year 1944, thereby, with more strict allocations, meeting the vital needs for all purposes. (J. C. Ms.)

Alexander, Sir Harold Rupert Leofric George

(1891–), British army officer, is the 3rd son of the 4th earl of Caledon. He was educated at Harrow and Sandhurst. He received his commission in the Irish Guards in 1911. At the end of World War I he was commanding a battalion with the rank of lieutenant-colonel. In 1919 he commanded a landwehr of the Lettish army during the confused fighting in the Baltic provinces. In 1934 he was given command of a brigade in India, and in the following year he saw service in the Loe-Agra and Mohmand operations. In 1938 he became major-general and was given the 1st division. In Sept. 1939 he took the 1st division to France with the B.E.F. Later as lieutenant-general he was promoted to command the 1st corps. At Dunkirk it fell to him to organize the final defense and evacuation, and he was among the last men to leave the beach. After Dunkirk he was made

general officer commanding in chief, southern command, serving in this capacity till he went to Burma in Feb. 1942 as general officer commanding at a critical period in the campaign. In Aug. 1942 General Alexander was sent to the middle east as commander in chief, in time to break the full-scale attack launched by the enemy at the end of August against the El Alamein position. Under his command the 8th army won its decisive victory of Oct. 23–Nov. 4 and pursued the defeated German and Italian forces under Marshal Rommel to Tobruk, Bengasi, Tripoli and the border of Tunisia. In Feb. 1943 General Alexander was appointed deputy commander in chief to General Eisenhower of the Allied armies in North Africa. All British, American and French troops in Tunisia were formed into the 18th army group and were placed under his orders. After the capture of Tunis and the axis surrender, General Alexander, as commander of the 15th British, Canadian and American group, directed the invasion of Italy in July and the invasion of the mainland of Italy in Sept. 1943.

Alfalfa. The 1943 crop of alfalfa hay in the United States fell 11% below the record crop of 1942. The 1943 crop was 32,465,000 tons compared to 36,478,000 tons in 1942 and 26,709,000 tons average for the period 1932–41 as estimated by the U.S. department of agriculture. The acreage harvested in 1943 was 95% of that of 1942 and considerably above the average. The 1943 crop was somewhat spotted and the quality of the early crop damaged by rains though the late crop was of high quality. The highest yields were in California, mostly on irrigated land, at 4.40 tons per acre, followed by Oregon 2.50 tons, Arizona 2.70, New Mexico 2.70 and Texas 2.50. None of the central or plains states exceeded 2.30 tons per acre.

U.S. Production of Alfalfa Hay in Leading States, 1943 and 1942 and the 10-Yr. Average
(in thousands of tons)

States	1943	1942	10-yr. average	States	1943	1942	10-yr. average
California	3,819	3,440	3,228	Nebraska	1,343	1,503	1,272
Minnesota	3,036	3,170	1,889	Colorado	1,327	1,369	1,197
Iowa	2,329	3,018	1,696	Montana	1,159	1,253	965
Wisconsin	2,132	2,859	1,860	Illinois	963	1,481	921
Michigan	1,902	2,268	1,701	New York	897	1,035	618
Idaho	1,853	1,852	1,887	Ohio	829	1,107	800
Kansas	1,408	1,028	946	Indiana	814	1,038	618

No other state produced more than 1,000,000 tons in 1942.

The production of alfalfa seed, estimated at 1,114,900 bu., was 15% larger than 1942 but 3% below the 10-year average. A larger acreage was harvested for seed in 1943 than in 1942. (*See* also HAY.) (J. C. Ms.)

Algeria: *see* FRENCH COLONIAL EMPIRE.

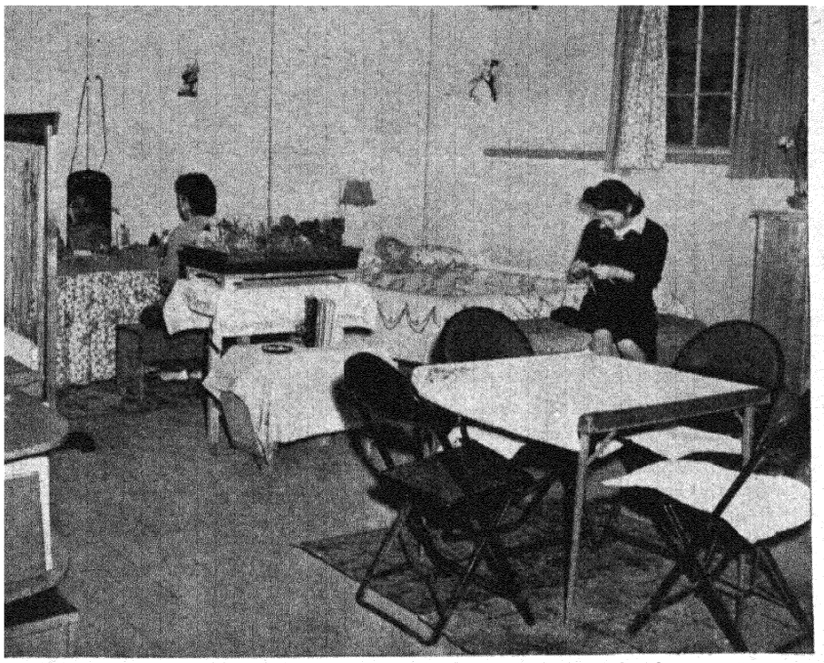
Aliens. Listed below are ten countries in rank order of registered aliens in the U.S. as of Dec. 31, 1940:

Italy, including Sicily and Sardinia	695,472
Canada	447,898
Poland	442,547
Mexico	416,600
Russia, including Russia in Asia	366,827
Germany	314,870
Great Britain, including England, Scotland, and Wales	291,557
Austria	191,600
Eire	158,154
Hungary	116,701
Total	3,442,316

Further studies indicated that more than 80% of the registered aliens were living in the following ten states: New York, 1,234,995; California, 531,882; Pennsylvania, 365,229; Massachusetts, 360,416; Illinois, 320,053; Michigan, 296,834; New Jersey, 276,026; Texas, 209,450; Ohio, 200,322; Connecticut, 157,120.

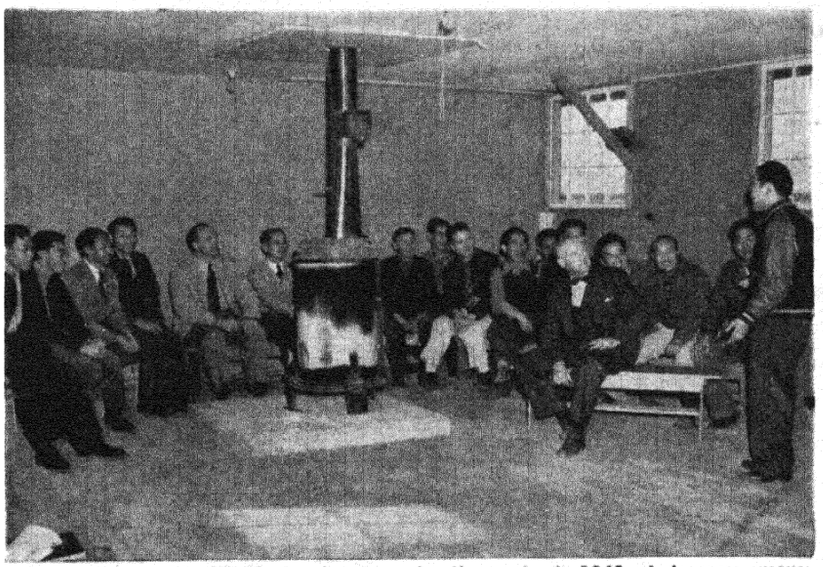
Of the nearly 5,000,000 aliens who registered under the Alien Registration act of 1940, approximately half were eligible for U.S. citizenship. The registration and unsettled world conditions tended to increase their desire to achieve United States citizenship. In the fiscal year 1943, 115,664 declarations of intention were filed as compared with 221,796 in 1942, and 224,123 in 1941. Petitions for naturalization numbered 375,700, which is the highest number filed during any fiscal year since June 30, 1906, when the federal government took over supervision of this activity.

Certificates of naturalization were issued to 318,933 persons, also a record number, during the fiscal year of 1943. The nations to which these new citizens formerly owed allegiance were: British empire, 93,827; Poland, 42,077; Italy, 36,118; soviet Russia, 25,444; Germany, 17,774; Czechoslovakia, 12,979; Sweden, 9,448; Yugoslavia, 8,471; Greece, 6,938; Hungary, 4,792; and all other countries, 59,640.



The Second War Powers act, approved March 27, 1942, made available an expeditious naturalization procedure to noncitizens serving in the armed forces of the United States. The statute provided a judicial naturalization process for those members of the armed forces who are residing within the jurisdiction of a naturalization court and an administrative naturalization process for those serving abroad with the armed forces. During the fiscal year ended June 30, 1943, 36,049 members of the military and naval forces residing in the United States, Alaska, Hawaii, Puerto Rico and the Virgin Islands of the United States were admitted to citizenship on the basis of petitions filed with naturalization courts. Of this total, 35,416 were granted citizenship while residing in continental United States or Alaska, 586 while on duty in Hawaii and 47 during service in Puerto Rico or the Virgin Islands of the United States.

In addition, a total of 1,425 persons serving abroad with the armed forces of the United States were admitted to citizenship under the administrative naturalization procedure authorized by the Second War Powers act of March 27, 1942. Naturalization was granted in such cases by designated representatives of the immigration and naturalization service.



Alien Enemies.—Under the Nationality act of 1940 alien enemies include natives, citizens, denizens and subjects of the countries against whom the United States declared war. In 1943 these countries were Japan, Germany, Italy, Hungary, Rumania and Bulgaria. By authority of presidential proclamations of Dec. 7 and 8, 1941, and Jan. 14, 1942, a series of regulations was promulgated by the department of justice affecting the conduct of citizens or subjects of Japan, Germany and Italy 14 years of age or older. On Oct. 12, 1942, aliens of Italian nationality, except those already interned or under parole, were excepted from the regulations for alien enemies by order of the attorney general.

Dangerous alien enemies who were ordered interned by the attorney general were kept in internment camps which are operated by the immigration and naturalization service. At the end of the 1943 fiscal year, 9,220 alien enemies were in the custody of the service of whom 5,988 were from the continental United States or Puerto Rico, 2,349 from Latin America, and 883 from Alaska, Hawaii and other Pacific islands. Sixteen detention stations were in operation at the end of the year. One of the internment camps, at Crystal City, Texas, was used solely for the internment of families of enemy nationalities, and at the end of the fiscal year 1943, 1,282 individuals were interned there, consisting of 367 men, 358 women and 557 children.

During 1943, 5,323 enemy aliens were apprehended under presidential warrants of arrest. Of this number, 2,311 were paroled upon formal orders of the attorney general, including 979 Japanese, 895 Germans, 434 Italians and 3 of miscellaneous nationality; and 266 Japanese, 294 Germans, 170 Italians and 12 of miscellaneous nationality were unconditionally released. Those

paroled were required to make regular reports to civilian supervisors and to district parole officers of the immigration and naturalization service who conducted periodic investigations in each such case. Aliens of enemy nationality might be naturalized under prescribed safeguards. The case of each enemy alien applicant for naturalization was thoroughly investigated by the immigration and naturalization service, and favourable recommendations were made to the courts only with respect to those petitioners for naturalization whose loyalty was established without question.

New Legislation.—During 1943 the following laws affecting aliens were passed by congress:

By far the most important measure approved by congress affecting aliens was the repeal in Dec. 1943, of the Chinese Exclusion laws. This legislation originated in 1882 and was retained on the statute books for 61 years, during which time it was subjected to many amendments and revisions. The congressional action at this time was designed to place the Chinese people on a parity with other nations for immigration purposes. The new legislation also removed the previously established prohibitions against naturalization of persons of the Chinese race as American citizens, and established an immigration quota permitting admission of a limited number of Chinese into the United States.

The act of July 13, 1943, authorized deportation under certain conditions to the country where the alien's recognized government in exile was located, or to a country proximate to the one of which the alien was a citizen or subject, or, with the consent of the country of which the alien was a citizen or subject, to any other country.

The act of April 29, 1943, permitted the entry of native-born agricultural workers from any western hemisphere country under certain exemptions and conditions. (E. G. H.)

Japanese Relocation.—When the United States entered the war in Dec. 1941, there were more than 100,000 persons of Japanese ancestry living in the far western states. Approximately two-thirds of them, born in the United States, were American citizens. The aliens, *Issei,* are an older group who came to the United States as labourers and farm workers. Their average age is around 60. The citizens, *Nisei,* are largely a young group, most of them educated or being educated in American schools. Their average age is around 22.

The problems created by the determination in March 1942, to remove from the defense zones of the Pacific coast all persons of Japanese ancestry, continued into 1943. The policy of permanent relocation in civilian activities outside of the coastal defense zones was continued by the War Relocation authority which established offices in many of the larger midwestern cities in an endeavour to assist the evacuees in finding employment.

By the end of 1943, approximately 20,000 Japanese had been released from the relocation centres on indefinite leave to accept employment. This represented the placement of the great majority of eligible *Nisei* and the War Relocation authority was faced with the far more difficult problem of re-establishing the loyal aliens still retained in the camps.

The National Student Relocation council reported that 870 Japanese-American students had been accepted by 362 colleges and universities which had been approved by the army and navy. Minor objections to the admission of *Nisei* students to some eastern and midwestern colleges were reported.

Disturbances within certain of the camps, especially Poston in Arizona and Manzanar in California, which occurred late in 1942, led the War Relocation authority to the conviction that disorders were being instigated by a minority of disloyal elements who were taking advantage of the inevitable social disorganization of relocation. In the original evacuation, stress had been placed upon retaining family units intact. In some of these families, there were younger persons who, while citizens of the United States, had been educated in Japan, and in others, older aliens who had never completely abandoned their loyalty to Japan. As their potentialities for mischief became more clearly evident, the War Relocation authority issued an order in July 1943, to segregate evacuees of doubtful loyalty to Tulelake centre in California.

An investigation of the disorders was undertaken by the Committee on Un-American Activities (Dies committee) of the house of representatives. Representatives John Costello (Dem.) of California, Carl E. Mundt (Rep.) of South Dakota and Herman Eberharter (Dem.) of Pennsylvania constituted the sub-committee which held hearings in the western states. The Dies subcommittee presented a report to congress listing several major complaints about the camps:

1. That Japanese of doubtful loyalty were being released.
2. That there were thousands in camps who had requested repatriation to Japan.
3. That loyal and disloyal Japanese were intermingling without segregation.
4. That the Japanese were being supplied food through the quartermaster corps of the army in greater variety and quantity than that available to the average American consumer.
5. That the discipline in the various relocation centres was very lax.

The committee failed to deny or affirm most of these charges, contenting itself with three recommendations:

1. That the disloyal be segregated from the loyal Japanese (already undertaken by the War Relocation authority).
2. That a special board be set up to investigate the loyalty of evacuees seeking release from the centres.
3. That the War Relocation authority inaugurate a thoroughgoing program of Americanization in the centres.

The third member of the sub-committee rendered a minority report taking to task the majority for not having clearly refuted most of the charges which brought about the investigation. Congressman Eberharter stated that the testimony before the committee showed conclusively:

1. That the Japanese being released from the camps were adequately investigated by the War Relocation authority and there was no evidence of laxness.
2. That a very limited number of Japanese had shown any desire for repatriation.
3. That segregation was taking place on the initiative of the War Relocation authority.
4. That all rationing restrictions were being applied to the camps without discrimination. Food costs averaged about 40 cents per person a day and the centres refrained from purchasing commodities where there were local shortages.
5. That evidence produced before the sub-committee indicated that there was much less crime of any kind in the relocation centres than in the average American community of the same size.

The Utah legislature in Feb. 1943 passed an alien property restriction bill denying the right of real property ownership to aliens ineligible to citizenship. This was vetoed by the governor and followed by a later bill of less stringent nature. Arkansas passed a similar anti-evacuee land ownership act which was later held unconstitutional by the attorney general of the state. In March the Arizona legislature passed a bill requiring three consecutive days of advertising by any business man doing business with Japanese. This law was held unconstitutional in the state superior court in July. In April the Iowa state legislature passed a resolution requesting the withdrawal of War Relocation authority students from Iowa colleges.

In the latter part of Jan. 1943, the army again accepted enlistments of *Nisei,* which resulted in 1,100 volunteers from the United States and 2,600 from Hawaii. It was estimated that the total number of Japanese-Americans in the armed forces of the U.S. exceeded 8,000. These *Nisei* were trained in separate camps in two sections of the United States. The first *Nisei* battalion which went into action on the Italian front received praise from its Caucasian officers. During July the Women's Army corps

was open for enlistment of *Nisei* girls.

In March the Western Defense Command eliminated much of Arizona from military area No. 1. This was followed by an announcement from the War Relocation authority that evacuees from this area would be permitted to return to their homes; the return took place without disorder.

At the time army enlistment was open to *Nisei,* a declaration of loyalty to the United States was required of all Japanese of draft age (total 20,679). Of these, about 24% declined to affirm their loyalty to the United States. These statements, however, did not constitute affirmation of loyalty to Japan. It was this group which had been transferred to the Tulelake centre. The ratio of so-called disloyal answers varied greatly as between the different camps, with Manzanar showing a refusal to affirm loyalty of almost 50% as against a percentage of 2.2 for Granada, Colorado. It should be remembered that the residents of Manzanar were about two months earlier fired on by the United States army, in order to terminate disorder, and two residents killed.

Several court cases grew out of relocation. The Korematsu, Hirabayashi and Yasui cases challenging the legality of the curfew and evacuation orders were heard by the 9th circuit court of appeals in San Francisco which refused to render a decision and referred the cases directly to the United States supreme court. The supreme court held that the defendants were guilty of violating curfew regulations, but refused to render a decision on evacuation, indicating that the court was probably divided on the latter point.

The suit of the Native Sons of the Golden West to have the names of all American-born Japanese withdrawn from voting lists was disposed of by an adverse decision of the 9th circuit court of appeals, followed by a refusal by the United States supreme court to review the case, on the ground that the right of American-born Japanese to citizenship had been previously determined. A number of civil cases were in the courts dealing with Japanese who were evacuated in the midst of contractual obligations which thereafter remained unperformed.

In July War Mobilization Director James F. Byrnes issued a statement to congress, in response to a resolution of inquiry, stating that the restrictions on persons of Japanese ancestry would be continued as long as military necessity demanded, and denying that evacuees were being given preferential treatment, or that disloyal Japanese were being released.

The year 1943 closed with considerable agitation against Japanese-Americans on the west coast. (*See* also CENSUS, 1940; WAR RELOCATION AUTHORITY.) (W. W. B.)

Alimentary System, Disorders of.

The Stomach and Duodenum.—The well-known preponderance of duodenal ulcer over gastric ulcer and the major importance of nonsurgical methods of treating ulcer were attested by F. H. Lahey's report. Of 7,000 patients with peptic ulcer submitted to treatment in the hospital, 6,550 had duodenal ulcer. Only 6.59% of these and 18.1% of the 450 patients with gastric ulcer were submitted to operation.

W. L. Palmer contended that alkalosis induced by soluble alkali, which is characterized by an increase in sodium, total base, pH, and in the bicarbonate content of the blood, does not develop if the function of the kidney is normal and if the amount of water supplied daily is sufficiently great to eliminate the alkali as rapidly as it is absorbed. The alkalosis observed during the administration of calcium carbonate is identical with that seen in patients with obstruction of the lower end of the stomach and can be prevented by administration of sufficient amounts of sodium chloride despite the continued use of the alkali. Chemically this alkalosis is characterized by a decrease in the concentration of chlorides, sodium and total alkali in the blood and by elevation of the pH and of the bicarbonate content of the blood.

As the result of an analysis made of 2,111 cases of grossly bleeding gastric and duodenal ulcer, including 75 personally observed cases, in all of which the patients were treated by the prompt and frequent feeding program, E. A. Rasberry, Jr. and T. G. Miller reported a gross mortality rate of 1.9%. These observers concluded that, in the absence of coincident perforation, such procedure is superior to any other form of conservative treatment or to surgical intervention.

Conservatism characterized the current literature on gastritis in 1943, not only with respect to incidence and clinical significance but also to its potentiality as a precursor to other diseases, especially carcinoma. In the gastroscopic examinations of 50 patients with uncomplicated duodenal ulcer, H. J. Tumen and M. M. Lieberthal found that 33 had an associated chronic gastritis. They concluded that gastritis did not regularly influence the clinical course of duodenal ulcer. Moreover, it was impossible to postulate the presence or absence of associated gastritis on the basis of the nature of the symptoms or the character of the response to treatment.

Absence of free hydrochloric acid in the gastric secretion is not an infrequent occurrence. The role that such acid plays in normal function consists chiefly of activation of pepsin, swelling of protein, stimulation of motor and secretory functions, and solution of iron. It also has a bactericidal effect. Previous investigators showed that the usual doses of dilute hydrochloric acid are ineffective in appreciably modifying the gastric acidity in achlorhydric states. A. E. Koehler and E. Windsor made exhaustive observations on the effect of the addition of acid to a representative ground meal at body temperature in vitro. It was determined that the usual amount of acid used in replacement therapy had but little effect on the pH of the meal, that the swelling of proteins as a step in solution and digestion is not appreciably influenced by even the maximal therapeutic doses of acid, and that the pH is not sufficiently lowered to have any bactericidal effect. It also was found that anacidity or hyperacidity had no effect on destruction of thiamin.

The Biliary Tract.—A modified technique for the determination of serum bilirubin which is more accurate than standard methods and provides for separate measurements of the fractions which give direct and indirect van den Bergh reactions was devised by B. Sepulveda and A. E. Osterberg. The various factors underlying a recurrence or persistence of symptoms after removal of the gall bladder were reviewed by H. K. Gray and W. S. Sharpe. The significance of calculi and inflammatory or obstructive lesions of the cystic duct was exemplified in their study of 44 cases in which the lesion was found at operation.

The diagnostic significance of the amount of urobilinogen excreted in urine and faeces is generally recognized. The investigations of Frederick Steigmann and Josephine Dyniewicz confirmed the superiority of Watson's method with respect to urinary urobilinogen. They also concluded that the value of the determination of the amount of faecal urobilinogen in random specimens by this method was equal to that of determinations on stools collected for four days.

Intestine.—Numerous articles stressed the effect of tropical diseases and their sequelae on the intestinal tract. Dysentery, and acute abdominal diseases such as acute appendicitis, acute cholecystitis, acute pancreatitis, even intestinal obstruction, may be simulated during the acute stages of malignant tertian malaria. Bacillary dysentery may persist in a chronic form and closely resemble chronic ulcerative colitis. Diarrhoea may be the result of amoebiasis or helminthic infestation. The clinical features of intestinal bilharziasis as observed in Southern Rhodesia were in-

structively described by M. Gelfand.

Allen, Terry de la Mesa (1888–), U.S. army officer, was born April 1 at Ft. Douglas, Utah. After several years' study at the U.S. Military academy, he enrolled at the Catholic University of America, where he received the A.B. degree in 1912. He was commissioned a second lieutenant of cavalry the same year. In World War I he served with the A.E.F., taking part in the St. Mihiel and Meuse-Argonne offensives, and after the armistice he remained overseas in the army of occupation. During the period between wars he undertook advanced study at the Cavalry school, the Command and General Staff school, the Infantry school and the Army War college. By the time the United States entered World War II he had reached the rank of brigadier general. In 1942 he was made a major general and given command of the 1st infantry division, which took part in the campaigns of Tunisia and Sicily. For his achievements in North Africa Allen received the distinguished service medal and the *Croix de guerre*.

In the fall of 1943 he was recalled to the United States to command the 104th division.

Allergy. The following new allergic causes for nasal symptoms were discovered: Vegetable gums (Gelfand), used in cosmetics; Spanish moss (Dean), often the upholstery of inexpensive furniture. Blumstein reported two cases of hay fever with nasal symptoms in May and June due to the ailanthus (tree of heaven) pollen. Hoersh emphasized the possibility of sensitization of infants by food odours in his report of nine cases of infantile eczema due to vapours or odours of cooked or uncooked food. Respiratory allergy due to such causes had been previously reported in 1942 by Urbach. Another unusual cause of eczema was reported by Keil who found that a resinous material used in finishing cotton fabrics caused skin sensitization.

For severe, intractable asthma Barach advised the following combination of previously described methods for the purpose of inducing bronchial relaxation: helium and oxygen for one to six hours daily, aminophyllin rectally, dilaudid in small doses, potassium iodide by mouth, and the inhalation of epinephrine (1:100). Only 17% of the cases thus treated failed to respond, 57% were rapidly relieved and 25% were classified merely as "helped."

The use of histamine associated with a modified horse serum was given added importance by the report of Cohen and Friedman, who found that the sera of patients treated with the histamine-horse serum conjugate contained specific antibodies capable of neutralizing histamine.

Freedman, "Antibodies to Histamine Induced in Human Beings by Histamine Conjugates," *ibid.*, 14:195–202 (1943). (B. Z. R.)

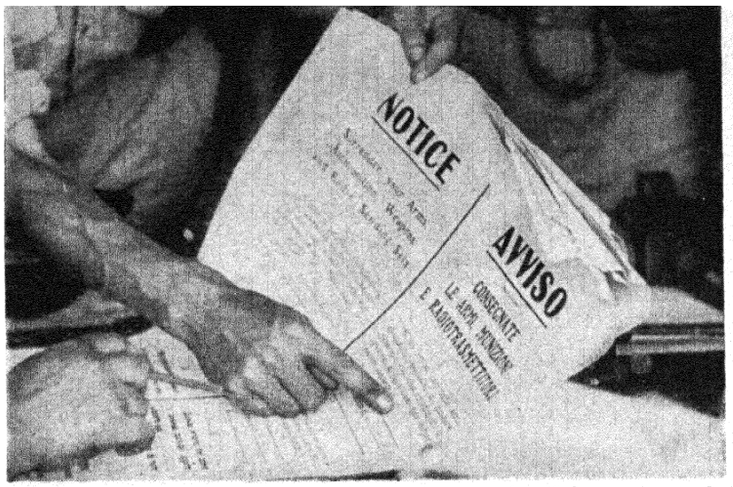
Allied Military Government. International law requires military forces to establish some form of organized control in the war-torn areas they occupy. In addition to humanitarian considerations, effective and immediate establishment of some form of government is an aid to the prosecution of the war effort. Pursuant to these considerations, the United Kingdom and the United States moved jointly to provide the necessary personnel and equipment for this purpose. Military control of civil affairs, planned well in advance of actual tactical operations, was a development of World War II. Heretofore, the organization of occupied areas was an improvised arrangement devoid of preparation for the problems to be faced.

Intensive training programs for both U.S. and British military personnel were carried out and plans were formulated for active service in anticipation of tactical developments. The burden of civil administration of enemy occupied territory, prior to the invasion of Sicily and the Italian mainland, fell largely to the British. With the invasion of Italian territory, truly Anglo-American military government became a joint enterprise.

Responsibilities, assignments and personnel were divided among the officers of the United States and the British empire without discrimination.

Allied military government officers were included in the first assault forces in Sicily and Italy and so effective was their work that they won highest praise from tactical commanders in the field. Effective and immediate control over areas occupied by Allied military government, first referred to as AMGOT, later as AMG, relieved tactical commanders of the necessity of detaching combat personnel for this purpose and assured them of a stabilized condition in the rear echelons.

Upon the invasion of Sicily and Italy, AMG officers introduced emergency measures to effect immediate relief of the civilian population and establish order in the rear of the fighting zones. This process was repeated as the battle lines entered new areas.



The returning of civilian populations to their cities, towns and homes was a primary consideration. In some areas only a few score inhabitants of large cities were to be found when Allied forces entered. The population had fled to the mountains and taken refuge there. Many of the cities and towns had suffered extensive war damage and AMG officers set out to restore as quickly as possible essential utilities, such as waterworks, sewerage systems and power plants. The debris of the cities was moved as rapidly as possible and improvised housing facilities for the homeless established.

Foodstuffs were made available to the civilian public through channels of trade and strict rationing was enforced. Only when need was actually apparent was direct relief granted.

Public health measures were inaugurated to prevent epidemics, curtail contagious diseases and to protect Allied military personnel as well as the local citizens. In several areas it was necessary to bury the dead, both military and civilian, left in the wake of the fighting forces. Civilian hospital facilities were restored as rapidly as possible and the co-operation of civilian medical and health agencies was invited and secured. The injured were hospitalized or treated. Special rations, including milk, were secured for children and nursing and pregnant mothers. Malarial control agencies, never wholly effective under the fascist regime, were implemented and co-ordinated.

Transportation facilities were restored as expeditiously as possible, roads and railroads repaired, bridges rebuilt, and war-damaged harbours cleaned out. In this work, native civilians were enrolled at reasonable wages. Prisoners of war were also used to the extent permitted under international law. Communication facilities and the postal system were opened for limited service.

Policing of occupied areas was promptly inaugurated. Local

STANDARD CLOTHES manufactured in the United States in 1943 for children of Allied-occupied countries

police establishments were reorganized and utilized whenever possible. Looting and other disorders were quickly eliminated. Military courts were set up for local offenses requiring immediate action. Proclamations and instructions were issued to the civil population informing them of their responsibilities and privileges. Legal administration extended to such fields as juvenile delinquency, and the supervision or reconstruction of penal and corrective institutions. Civil courts were re-established whenever practical after the elimination of fascist elements. Steps were taken to reform and reorganize bar associations under pre-fascist regulations.

All financial institutions were originally closed by AMG. In some instances local supplies of stamps and currency had been burned by the retreating enemy, while securities and other valuables had been removed. AMG introduced fresh and adequate supplies of stamps and currency, exchange rates were posted and as soon as feasible banks were reopened. In a number of reopened banks, deposits had increased materially. Financial officers of the AMG also took over the supervision of postal savings, insurance companies and similar institutions. All civil incomes, taxes and disbursements were placed in the hands of the AMG.

Initial political activities of the AMG consisted, to a large extent, of releasing the political prisoners of the fascists and rescinding fascist decrees, racial and religious laws and edicts. Political activity of the populations of the occupied areas was allowed after the early stages of the operations, in such degrees as was consistent with maintenance of public order. With the exception of the removal of known or suspected fascists, the administration of civil agencies was left largely undisturbed.

The AMG took every possible precaution to preserve cultural and art treasures left behind by the retreating enemy. Educational institutions were reorganized and reopened as rapidly as possible. Committees of responsible non-fascist educators were appointed to serve with AMG in eliminating propaganda text books and in reorganizing school curricula. Plans were made for the reopening of universities as rapidly as adequate buildings could be found and non-fascist faculties recruited.

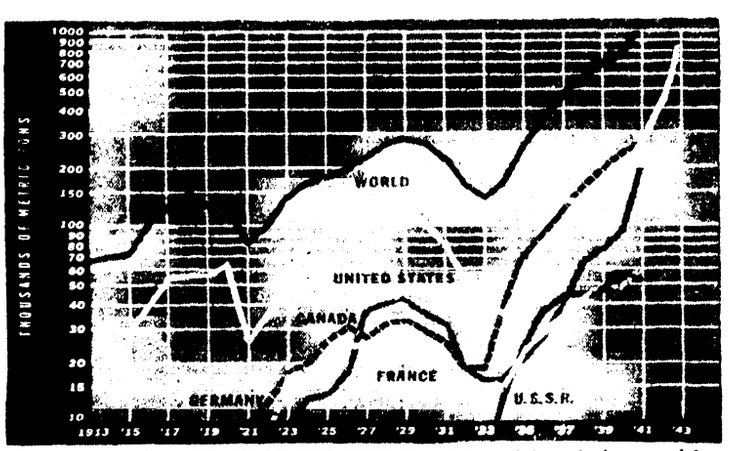
Aluminum.

Statistics from all of the producing countries being lacking, there is nothing that can be added to the production table presented in previous years.

All of the belligerents in World War II, which designation includes all of the important producers of aluminum, enlarged their production capacity, but so far as was known in 1943, the United States made the largest additions. The only information that was made public regarding current production was an official announcement in August 1943, that the output in July was 150,892,000 lb. (73,292,000 lb. in government owned plants and 77,600,000 lb. in privately owned plants) and that the total output for January-July was 515,899,725 lb. The fact that the July output was more than double the monthly average for January-July indicated that extensive increases in output were made during the first half of the year. Also, it was reported that some plant capacity was not in operation because of labour shortage. This would indicate that the current production capacity of the United States was in 1943 at least three times that of 1941, when output was 280,000 metric tons, and was in excess of the world output of 1940. Assuming the July rate of output to continue during the remainder of the year, the 1943 total would be just about double the 1941 output.



World Production of Aluminum
(Metric tons)

	1937	1938	1939	1940	1941
Canada	42,500	66,000	75,000	95,000	200,000
France	34,500	45,300	50,000	50,000	60,000
Germany	127,500	161,100	200,000	240,000	270,000
Great Britain	19,400	23,300	25,000	32,000	35,000
Italy	22,000	25,800	32,400	36,000	40,000
Japan	10,500	17,000	23,000	32,000	40,000
Norway	23,000	29,000	31,100	20,000	35,000
Switzerland	24,000	27,000	28,000	29,000	28,000
U.S.S.R.	37,700	43,800	50,000	55,000	50,000
United States	133,000	130,400	148,700	187,600	280,000
Others	7,200	10,400	7,400	7,500	6,000
Total	482,300	581,600	672,400	785,000	1,045,000

Canadian capacity was similarly increased, and was unofficially reported to be about 450,000 tons a year. United States government purchases in Canada since 1941 exceeded 600,000 metric tons, about one-third of which had been delivered up to May 1943.

As a result of these developments the aluminum supply was improved to such an extent that the War Production board lifted the restrictions on some uses; furthermore, development work on many marginal bauxite deposits was stopped, and construction work on several new fabrication plants suspended. Not only had metal production caught up with demand, but scrap became so plentiful that its disposition was a major problem. (*See* also BUSINESS REVIEW; METALLURGY.)

Ambassadors and Envoys.

The following is a list of ambassadors and envoys to and from the United States and to and from Great Britain Jan. 1, 1944.

To and From the United States

To the United States	*Country*	*From the United States*
Aziz, Abdol H.	Afghanistan	Engert, Cornelius Van H.
*Espil, Felipe A. (absent)	Argentina	*Armour, Norman
Dixon, Sir Owen	Australia	Johnson, Nelson T.
*Straten-Ponthoz, Count Robert van der	Belgium	*Biddle, Anthony J. D., Jr.[3]
*Guachalla, Dr. Luis F.[1]	Bolivia	*Boal, Pierre de L.[4]
*Martins, Carlos	Brazil	*Caffery, Jefferson
*McCarthy, Leighton	Canada	*Atherton, Ray
*Michels, Rodolfo	Chile	*Bowers, Claude G.
*Wei Tao-ming, Dr.	China	*Gauss, Clarence E.
*Turbay, Gabriel	Colombia	*Lane, Arthur Bliss
*Escalante, Carlos M.	Costa Rica	*Des Portes, Fay A.
*Concheso, Dr. Aurelio F.	Cuba	*Braden, Spruille
*Hurban, Vladimír	Czechoslovakia	*Biddle, Anthony J. D., Jr.[3]
Kauffmann, Henrik de	Denmark	

To the United States	*Country*	*From the United States*
*Copello, Anselmo	Dominican Rep.	*Warren, Avra M.
*Alfaro, Capt. Colón E.	Ecuador	*Scotten, Robert M.
Hassan Bey, Mahmoud	Egypt	Kirk, Alexander C.
Brennan, Robert	Eire (Ireland)	Gray, David
*Castro, Dr. Hector D.	El Salvador	*Thurston, Walter
Kaiv, Johannes[2]	Estonia	
Ephrem, Blatta	Ethiopia	Caldwell, John K.
Procopé, Hjalmar J.	Finland	Schoenfeld, H. F. Arthur
*Halifax, Viscount	Great Britain	*Winant, John G.
*Diamantopoulos, Cimon P.	Greece	*MacVeagh, Lincoln[5]
*Recinos, Dr. Adrian	Guatemala	*Long, Boaz
*Liautaud, André	Haiti	*White, John C.
*Caceres, Dr Julian R.	Honduras	*Erwin, John D.
Thors, Thor	Iceland	Morris, Leland B.
Shayesteh, Mohammed	Iran	Dreyfus, L. G., Jr.
Jawdat, Ali	Iraq	Henderson, Loy W.
Bilmanis, Dr. Alfred	Latvia	
	Liberia	Walton, Lester A.
Žadeikis, Povilas	Lithuania	
Le Gallais, Hugues	Luxembourg	Biddle, Anthony J. D. Jr.[3]
*Castillo Nájera, Dr. Francisco	Mexico	*Messersmith, George S.
*Loudon, Dr. A.	Netherlands	*Biddle, Anthony J. D., Jr.[3]
Nash, Walter (absent)	New Zealand	Burdett, William C.[6]
*Sevilla Sacasa, Guillermo	Nicaragua	*Stewart, James B.
*Munthe de Morgenstierne, Wilhelm	Norway	*Biddle, Anthony J. D., Jr.[3]
*Jiménez, E. A.	Panama	*Vacant
*Velázquez, Dr. Celso R.	Paraguay	*Frost, Wesley
*Freyre y Santander, Manuel de	Peru	*Vacant
*Ciechanowski, Jan	Poland	*Biddle, Anthony J. D., Jr.[3]
Bianchi, João A. de	Portugal	Norweb, R. Henry[7]
*Cárdenas, Juan F. de	Spain	*Hayes, Carlton J. H.
Boström, W.	Sweden	Johnson, Herschel V.
Bruggmann, Charles	Switzerland	Harrison, Leland
Seni Pramoj, Rajawongse	Thailand	
*Ertegün, Mehmet M.	Turkey	*Steinhardt, Laurence A.
Close, Ralph W. (absent)	Union of South Africa	Vacant
*Gromyko, Andrei A.	U.S.S.R.	*Harriman, W. Averell
*Blanco, Dr. Juan C.	Uruguay	*Dawson, William
*Escalante, Dr. Diógenes	Venezuela	*Corrigan, Frank P.
*Fotitch, Constantin	Yugoslavia	*MacVeagh, Lincoln[5]

*=ambassadors; unstarred, envoys.
[1]Resigned Jan. 1944.
[2]Acting consul general in New York City.
[3]Resigned Jan. 22, 1944. Chargés d'Affaires carried on his work as ambassador to the governments of Belgium, Czechoslovakia, the Netherlands, Norway and Poland and as minister to the government of Luxembourg, all established in England.
[4]Recalled Jan. 1944.
[5]Accredited to the governments of Greece and Yugoslavia established in Egypt.
[6]Died Jan. 13, 1944.
[7]With the personal rank of ambassador.

The following special diplomatic appointments were made during 1943:

	Name	*Title*
French Committee of National Liberation	Wilson, Edwin C.[1]	U.S. representative
Advisory Council to the Allied Control Commission for Italy	Murphy, Robt.[1]	U.S. member
United Nations European Advisory Commission	Winant, John G.	U.S. representative
Middle East and Middle East Supply Centre	Landis, James M.[2]	American Director of Economic Operations in the Middle East and Principal American Civilian Representative at the Middle East Supply Centre
French West Africa	Glassford, William A., Vice Admiral[2]	Personal representative of the president

[1]With the personal rank of ambassador.
[2]With the personal rank of minister.

To and From Great Britain

To Great Britain	*Country*	*From Great Britain*
Sardar Ahmed Ali Khan	Afghanistan	Squire, G. F.
*Cárcano, Dr. Miguel Angel	Argentina	*Kelly, Sir D. V.
*de Marchienne, Baron de Cartier	Belgian Govt. (in London)	*Oliphant, Sir Lancelot
Patiño, Antenor	Bolivia	Rees, Thomas I.
*de Aragão, J. J. Moniz	Brazil	*Charles, Sir Noel N. H.
*Bianchi, Manuel	Chile	*Orde, Sir Charles W.
*Koo, Dr. V. K. Wellington	China	*Seymour, Sir H.
Jaramillo Arango, Dr. Jaime	Colombia	Snow, T. M.
(*Vacant*)	Costa Rica	§Patron, F. J.
de Blanck, Guillermo	Cuba	Ogilvie-Forbes, Sir G. A. D.
*Lobkowicz, Maximilian	Czechoslovak Provis. Govt. (in London)	[1]Nicholls, P. B. B.
[2]Reventlow, Count Eduard	Denmark	
Pérez-Alfonseca, Dr. Ricardo	Dominican Republic	Andrews, C. F. W.
Freile Larrea, Carlos	Ecuador	Hallett, L. C. Hughes
*Hassan Nashat Pasha	Egypt	*Killearn, Lord
Gabre, Belata Ayela	Ethiopia	Howe, R. G.
[3]Viénot, Pierre	French C'ttee of National Liberation (in Algiers)	[3]Cooper, Alfred Duff
*Aghnides, Thanassis	Greek Govt. (in Cairo)	*Leeper, R. W. A.
§Arévalo, Dr. Ismael Gónzalez (Guatemala and Nicaragua)	Guatemala, Honduras, Nicaragua and Salvador	Leche, J. H. (*ad int.*)
	Haiti	Tuson, A. A. L.
	Honduras	§Kemball, C. G.
Benediktsson, Pétur	Iceland	Shepherd, E. H. G.
Seyed Hassan Taqizadeh	Iran	Bullard, Sir R. W.
Sayid Daud al Haidari	Iraq	*Cornwallis, Sir Kinahan
‡de Lynden, Baron Robert Aernout	Liberia	§Trant, J. P.
§Clasen, André (*ad int.*)	Luxembourg Govt. (in London)	Oliphant, Sir Lancelot
Diaz, Dr. Alfonso de Rosenzweig	Mexico	Bateman, C. Harold
Gen. Shingha Shumshere Jung Bahadur Rana	Nepal	Betham, Lt. Col. G. L.
*van Verduynen, Jonkheer E. Michiels	Netherlands Govt. (in London)	*Bland, Sir G. N. M.
Herdocia, Dr. Constantino (absent: *see* Guatemala)	Nicaragua	§Leake, J. R. M.
*Colban, E. A.	Norwegian Govt. (in London)	*Collier, L.
§Parras, Dr. Demetrio (*ad int.*)	Panama	Irving, S. G.
(*Vacant*)	Paraguay	Brickell, D. F. H.
Benavides, Alfredo	Peru	Forbes, V. C. W.
*Raczyński, Count Edward	Polish Govt. (in London)	*O'Malley, Sir O. St. C.
*The Duke of Palmella	Portugal	*Campbell, Sir Ronald
(*Vacant*)	Salvador	§Joint, E. J.
Sheikh Hafiz Wahba	Saudi Arabia	Jordan, S. R.
*The Duke of Alba	Spain	*Hoare, Sir Samuel
Prytz, Björn Gustaf	Sweden	Mallet, V. A. L.
Thurnheer, Walter	Switzerland	Norton, C. J.
	Syria and the Lebanon	Spears, Maj. Gen. Sir E. L.
*Orbay, Huseyin Rauf	Turkey	*Knatchbull-Hugessen, Sir H. M.
*Gousev, Feodor Tarasovitch	U.S.S.R.	*Clark Kerr, Sir Archibald
*Winant, John G.	United States	*Halifax, Viscount
Castellanos, Dr. Daniel	Uruguay	Vereker, G. G. M.
	Vatican	Osborne, Sir F. d'A. G.
Pocaterra, José Rafael	Venezuela	Gainer, D. St. C.

American Academy of Arts and Letters.

The American Academy of Arts and Letters was founded in 1904 by the National Institute of Arts and Letters, in order to make the institute more efficient in carrying out the purposes for which it was organized, namely

the protection and furtherance of literature and the fine arts and to give greater definiteness to its work. The membership of the academy is limited to 50, chosen only from the members of the institute.

On May 12, 1943, the academy and institute held a second joint public ceremonial at which new members of the institute were inducted, ten $1,000 "arts and letters" grants were given and medals awarded. An exhibition of the works by newly elected members, recipients of the "arts and letters" grants, and sculpture by Carl Milles, recipient of the "award of merit medal," was opened in the art gallery and museum. This continued through June 23. On October 22 the annual meeting of the academy took place, at which the election of five new members was announced and officers were elected for the ensuing year.

The officers of the academy for 1943–44 were: Walter Damrosch, president; James Truslow Adams, chancellor and treasurer; Van Wyck Brooks, secretary. The other six directors were William Adams Delano, Charles Dana Gibson, Sinclair Lewis, Paul Manship, Deems Taylor and Chauncey B. Tinker. (F. GN.)

American Academy of Arts and Sciences.

The academy is limited to 800 fellows and 130 foreign honorary members, divided among four classes: mathematical and physical sciences, natural and physiological sciences, the social arts, the humanities. The officers for 1943 were: president, Harlow Shapley; corresponding secretary, Abbott P. Usher; recording secretary, Hudson Hoagland; treasurer, Horace S. Ford. The following papers were presented at the monthly meetings: George Sarton, "Leonardo, Man of Science"; Otto Benesch, "Leonardo da Vinci and the Beginning of Scientific Drawing"; Charles W. Eliot, "City Planning"; Ross A. McFarland, "Human Problems in Aviation"; Henry M. Wriston, "The Problem of the Liberal Arts College"; Paul C. Mangelsdorf, "Economic Plants as Weapons of War"; Manley O. Hudson, "International Organization after the War"; Francisco Castillo Najera, "Mexican-American Cultural Relations"; Kirtley F. Mather, "Earthquakes, Volcanoes, and Mountain Systems of Mexico"; George Sarton, "Nicholas Copernicus"; Fred L. Whipple, "The Solar System"; Bart J. Bok, "The Milky Way and the Metagalaxies." The following paper was read by title: Frederic T. Lewis, "The Advent of the Microscope in America, with notes on its Earlier History." Grants in aid of research were made from the Rumford fund, the C. M. Warren fund and from the Permanent Science fund. (A. P. U.)

American Academy of Political and Social Science.

On April 9 and 10, 1943, there was held the 47th annual meeting of the academy with the general subject "The United Nations and the Future." Other meetings of 1943 included a session on February 13th on "The Future of Western Europe" addressed by Paul van Zeeland, formerly Prime Minister of Belgium, M. P. L. Steenberghe, chairman of the economic, financial and shipping mission of the kingdom of The Netherlands, and others; a gathering on Oct. 6 on "American Business After the War" with addresses by James B. Carey, secretary of the C.I.O., Stuart Chase, and Paul G. Hoffman, president of the Studebaker corporations and chairman of the committee for economic development; and a meeting on Nov. 22 on "The East and the West" addressed by Joseph C. Grew, former United States ambassador to Japan, Pearl S. Buck, and Dr. Y. C. James Yen.

During 1943 the six bimonthly issues of *The Annals* had the following titles: "Nutrition and Food Supply: The War and After" (January); "Southeastern Asia and the Philippines" (March); "Our Servicemen and Economic Security" (May); "The United Nations and the Future" (July); "The American Family in World War II" (September); "Transportation: War and Postwar" (November). The academy also publishes a pamphlet series; during 1943 there appeared No. 13 entitled "The Core of a Continent" which consists of five addresses by Henryk Strasburger, minister of finance of Poland.

Student memberships, offered for the fourth year in 1943, totalled 268. Under this arrangement students enrolled in educational institutions receive all of the privileges of regular membership at a cost of only $3.00 per year instead of the usual $5.00.

The same arrangement was made for members of the armed services of the United States and 226 persons had taken advantage of this offer.

The officers for 1943 were: Ernest Minor Patterson, president; J. P. Lichtenberger, secretary; Charles J. Rhoads, treasurer; Thomas S. Hopkins, assistant treasurer; Herbert Hoover, Carl Kelsey and C. A. Dykstra, vice-presidents. Headquarters are at 3457 Walnut St., Philadelphia 4, Pa. (E. M. P.)

American Association for the Advancement of Science.

The officers of the American Association for the Advancement of Science for 1943 were: Dr. Isaiah Bowman, president of the Johns Hopkins university, president; Forest Ray Moulton, permanent secretary; Otis W. Caldwell, general secretary; William E. Wrather, treasurer; Sam Woodley, assistant secretary; retiring president, Arthur H. Compton.

The vice-presidents were: F. D. Murnaghan, for the section on mathematics; J. W. Beams, for the section on physics; Arthur J. Hill, for the section on chemistry; Otto Struve, for the section on astronomy; John K. Wright, for the section on geology and geography; Carl R. Moore, for the section on zoological sciences; William J. Robbins, for the section on botanical sciences; Robert Lowie, for the section on anthropology; Herbert Woodrow, for the section on psychology; F. Stuart Chapin, for the section on social and economic sciences; Henry E. Sigerist, for the section on historical and philological sciences; Thorndike Saville, for the section on engineering; P. D. Lamson, for the section on medical sciences; R. E. Buchanan, for the section on agriculture; and Harold F. Clark, for the section on education.

The membership increased to 24,800 by the admission of 2,688 new members.

The annual meeting scheduled to be held in New York beginning Dec. 27 was cancelled because of lack of railway transportation facilities and no summer meeting was held. The Theobald Smith Award for a distinguished contribution to medical science by a person under 35 years of age was awarded to Dr. Sidney C. Madden, of the University of Rochester school of medicine and dentistry and Strong Memorial hospital, for his work on plasma proteins.

The publications of the association include 18 technical quarto volumes, the ones on *Human Malaria* and *Relapsing Fever* being widely used by the medical corps of the United States army and navy in the tropics. Its nontechnical science series includes *Multiple Human Births—Twins and Supertwins, Strange Malady—the Story of Allergy, Alcohol Explored* and *Man's Food: its Rhyme or Reason.* Its serial publications are the *A.A.A.S. Bulletin* and *The Scientific Monthly.* Each member of the association receives with his membership subscriptions to the *A.A.A.S. Bulletin* and to either *The Scientific Monthly* or the weekly journal *Science.* (F. R. Mo.)

American Association of Law Libraries.

The American Association of Law Libraries during 1943 continued monthly publication of the *Index to Legal Periodicals* and completed the sixth 3-year bound cumulation covering the period August 1940 to July 1943. The *Law Library Journal* also published by the Association was curtailed from six to five issues. In 1944 it will appear quarterly.

Founded in 1906, the American Association of Law Libraries was incorporated in 1935 under the laws of the District of Columbia "as a nonprofit organization to promote librarianship, to develop and increase the usefulness of law libraries, to cultivate the science of law librarianship, and to foster a spirit of co-operation among the members of the profession." The Association in 1943 had a membership of over 500 bar association, county, court, government, law school and state law librarians in the United States and Canada.

The officers for the year 1943–44 were: president, Alfred Morrison, law librarian, University of Cincinnati; president-elect, William S. Johnston, librarian, Chicago Law institute; executive secretary and treasurer, Miss Helen Newman, associate librarian, supreme court of the United States; and members of the executive committee, Mrs. Bernita J. Long, law librarian, University of Illinois (retiring president); Miss Jean Ashman, law librarian, Indiana university; Arthur C. Pulling, law librarian, Harvard Law school; and William R. Roalfe, law librarian, Duke university (on leave), Office of Price Administration, Washington, D.C. (H. Ne.)

American Bankers Association.

During the association's year 1942–43, the major portion of its activities was given over to assisting the nation's war effort. The association, serving as the liaison agent between 14,000 banks and the various agencies and departments of the government in Washington, assisted the banks in providing the following war services: U.S. treasury financing, in which the banks sold 85% of all war bonds bought by the public and in addition bought many billions more for their own account; ration coupon banking, in which the banks handled the accounting and clearing procedure involved in the use of ration coupons by the public; freezing the funds of enemy aliens; serving as tax collection agencies for the bureau of internal revenue; financing war production factories by means of some $7,000,000,000 of war loans and commitments; financing farmers in increasing their production to meet the goals of the Food-for-Victory program; establishing banking facilities for service men in army camps and naval stations, and providing trust services for men in the armed forces.

At the association's war service meeting held in New York city, Sept. 13–15, 1943, the following officers were elected for the ensuing association year: president, A. L. M. Wiggins, president, Bank of Hartsville, Hartsville, S.C.; vice-president, W. Randolph Burgess, vice-chairman, National City Bank of New York, New York city; treasurer, Wilmer J. Waller, president, Hamilton National bank, Washington, D.C.; president, national bank division, F. Raymond Peterson, president, First National Bank of Paterson, Paterson, N.J.; president, state bank division, Wood Netherland, vice-president, Mercantile-Commerce Bank and Trust company, Saint Louis, Mo.; president, savings division, Fred F. Lawrence, treasurer, Maine Savings bank, Portland, Me.; president, trust division, Henry A. Theis, vice-president, Guaranty Trust company, New York city; president, state secretaries section, Lauder W. Hodges, executive manager, California Bankers association, San Francisco, Calif.

The association's secretary, Richard W. Hill, and its executive manager, Dr. Harold Stonier, both of New York city, would continue in office through the year 1943–44. (L. Gn.)

American Bar Association.

As part of its war program the association jointly sponsored, with the war and navy departments, free legal assistance offices for soldiers, sailors and their dependents; prepared and distributed 33,000 copies of a manual of law of civilian defense; and stimulated the volunteer service of lawyers in the administration of the selective service system. Problems dominating the discussions at the 1943 meeting in Chicago were: (1) legal procedures and structure of an international organization to maintain peace, and (2) the control and prevention of administrative absolutism by governmental bureaus. Officers elected for 1943: Joseph Welles Henderson, president; Guy Richards Crump, chairman of the house of delegates; Harry S. Knight, secretary; John H. Voorhees, treasurer; Joseph D. Stecher, assistant secretary.

Awards.—The annual medal was awarded to John J. Parker, senior judge of the United States circuit court of appeals for the 4th circuit, for distinguished service to American jurisprudence. The Ross prize of $3,000 went to Lester Bernhardt Orfield, professor of law, University of Nebraska, for an essay on "What Should Be the Function of the States in our System of Government?" Awards of merit were given to the State Bar Association of California, the District of Columbia Bar association, the Bar Association of the County of Bergen, New Jersey, and honorable mention to the Missouri State Bar association. (M. Dn.)

American Bible Society.

The 127th annual meeting of the American Bible society was held in May 1943. John T. Manson was president; Gilbert Darlington, treasurer. General secretaries were Rev. Dr. Eric M. North, Rev. Dr. Frederick W. Cropp (on leave), Frank H. Mann, M.A., and Rome A. Betts, M.A., Rev. Dr. Francis C. Stifler was editorial and recording secretary.

The society distributes about 5,000,000 volumes of Scripture annually in the United States and an equal number in other lands. In co-operation with the British and Foreign Bible society, the Scottish Bible society and other missionary organizations, the Scriptures were translated into 1,058 languages up to the end of 1942 and about 21,000,000 volumes were distributed in 1942 throughout the world. (F. C. St.)

American Chemical Society.

The society operates under a national charter from the 75th congress. In 1943 the presidency passed from Dr. Harry N. Holmes of Oberlin college to Dr. Per K. Frolich of the Standard Oil Development Co., with Dr. Thomas Midgley of the Ethyl Corp. as president-elect. National meetings in Detroit and Pittsburgh showed attendances of 3,719 and 3,537 with 327 and 365 papers, respectively. The 102 local sections were more active than ever. The awards of the society: Kenneth Sanborn Pitzer, American Chemical society award in pure chemistry (sponsored by Alpha Chi Sigma fraternity); Herbert E. Carter, Eli Lilly and Co. award; Earle O. Whittier, Borden award; no award, A.C.S. Women's award (Garvan medal); Charles Glenn King, Pittsburgh award; John Frank Schairer, Hillebrand award; Carl S. Marvel, Nichols medal; Raymond R. Ridgway, Schoellkopf medal; Conrad Arnold Elvehjem, Willard Gibbs medal. Membership passed 36,000. (C. L. Ps.)

American College of Surgeons.

The college was founded in 1913 by 500 surgeons of the United States and Canada, under the leadership of Dr. Franklin H. Martin, to elevate the standards of surgery and to stimulate high professional and ethical ideals. The fellowship for 1944 numbered approximately 14,000; 605 were received into fellowship in 1943. Chairman, board of regents, Dr.

Irvin Abell, Louisville, Kentucky; president in 1941 until the succeeding presidential meeting (the 1942 and 1943 clinical congresses and inaugural ceremonies were cancelled because of the war), Dr. W. Edward Gallie, Toronto, Ontario; president-elect, Dr. Irvin Abell, Louisville, Kentucky; treasurer, Dr. Dallas B. Phemister, Chicago, Illinois; secretary, Dr. Frederick A. Besley, Waukegan, Illinois; associate director and chairman, administrative board, Dr. Malcolm T. MacEachern, Chicago, Illinois; associate director, Dr. Bowman C. Crowell, Chicago, Illinois; assistant director, Dr. E. W. Williamson, Chicago, Illinois. The organization originated hospital standardization, 1918, formulating minimum standards for approval and starting periodic surveys; 3,253 hospitals in United States, Canada, and other countries were on the 1943 approved list; 392 cancer clinics in hospitals and 1,101 medical services in industry were approved in 1943. Hospitals approved for graduate training in surgery and surgical specialties in 1943 numbered 222. An approved list of medical motion picture films is issued yearly. The college maintains a medical library and literary research department. Committees on cancer, archives of cancer, fractures and other traumas, and the Hall of the Art and Science of Surgery function through a department of clinical research. War sessions were held in 1943 in 20 cities throughout the United States, with a combined attendance of nearly 14,000 physicians, medical students, and hospital executives. A similar series of War sessions was planned for March and April 1944, in 22 cities in the United States and Canada. (M. T. M.)

American Dental Association. The American Dental association, founded in 1859 at Niagara Falls, N.Y. is the second national dental association to be formed in the United States, the first being the American Society of Dental Surgeons, established in 1840 and disbanded in 1856. The Civil War split the American Dental association's membership, and in 1869 the Southern Dental association was organized. In 1897 the two organizations merged to form the National Dental association, which in 1922 adopted the original title, The American Dental association.

The American Dental association is composed of 58 state and territorial societies which in turn are formed of approximately 440 component societies organized in cities, counties and districts. The 58,000 members, through their state and local societies, annually elect their delegates, about 280, who in turn elect the association's president, three vice-presidents, secretary, treasurer and 13 trustees.

The association endeavours to cultivate and promote the art and science of dentistry, to direct and encourage dental research, to improve dental education, to disseminate knowledge of dentistry, and to enlighten and direct public opinion in relation to oral hygiene and the care of the oral cavity.

In 1942 the association voted to discontinue its annual conventions for the duration of the war, therefore, the 1943 meeting held in Cincinnati, Ohio, Oct. 11–13, was devoted exclusively to association business affairs.

The officers elected for the year 1944 were: president, Captain C. Raymond Wells; president-elect, Dr. Walter H. Scherer; first vice-president, Dr. Holly C. Jarvis; second vice-president, Dr. H. B. Higgins; third vice-president, Dr. F. A. Pierson; secretary, Dr. Harry B. Pinney; treasurer, Dr. Roscoe H. Volland. (L. W. M.)

American Economic Association. This nation-wide professional organization of economists was founded in 1885 to encourage economic research and stimulate thought and discussion of economic problems. It was composed in 1943 of 3,786 members and 1,275 library, corporate and other subscribers. Publications consisted of a quarterly journal, the *American Economic Review*, the *Papers and Proceedings* of the annual meetings, occasional monographs on special subjects, a *Directory* of its members and an information booklet.

The 56th annual meeting scheduled to be held in Washington, D.C., Jan. 20–23, 1944, was not to be considered a national meeting, though held jointly with the American Political Science association and the American Society for Public Administration, since only members in that vicinity and outside participants were expected to attend.

Officers for the year 1944: president, Joseph Stancliffe Davis, Stanford university; vice-presidents, Edward Hastings Chamberlin, Harvard university; Charles Oscar Hardy, Federal Reserve bank, Kansas City, Mo.; elected members of the executive committee, William L. Crum, Harvard university; Leonard L. Watkins, University of Michigan; Corwin D. Edwards, Washington, D.C.; Carl S. Shoup, Columbia university; Frank Whitson Fetter, Haverford college; Theodore W. Schultz, University of Chicago; secretary-treasurer and editor of *Proceedings*, James Washington Bell Northwestern university; managing editor of the *American Economic Review*, Paul T. Homan, Cornell university. (J. W. Bl.)

American Federation of Labor. The American Federation of Labor reached the highest numerical point in its history in 1943 with a paid-up membership of 6,564,141 on Aug. 31. During 1943 the activities of the federation were directed principally toward extension of organization and in furthering the war effort of the country. The success of the organizing work was reflected in the gain in membership, and the report of the federation for the year which ended Aug. 31, 1943, focused attention on the dual purpose of the federation to maintain and extend uninterrupted war production and to plan for the postwar period, which would directly concern the welfare of the wage earners who would be faced with the necessity for a return to peacetime levels of production.

In planning for the postwar period the federation also continued its contacts in the international labour field wherever possible so that the workers of all nations might be protected in the peace negotiations.

In the administration of the war effort federation representatives served on various government boards and agencies charted with policy making and administration, such as the Combined War Labor board, National War Labor board, Manpower board, War Production board, Price Control and Rationing boards, the President's Committee on Fair Employment Practices, etc.

One of the principal responsibilities of the national federation was in the legislative field, not only to secure the enactment of desirable measures but also to guard against legislation which would react against the best interests of the wage earners. Special energy was directed to secure the repeal of anti-labour measures enacted and to prevent a spread of anti-strike and other labour-restricting legislation in both the national and state legislatures. (*See* also Congress of Industrial Organizations; Labour Unions; Strikes and Lock-outs; United States.) (W. G.)

American Geographical Society. During 1943 a large part of the work of the research and cartographic staffs of the American Geographical society was devoted to special projects of various agencies of the federal government in connection with the prosecution of the war and preparations for postwar planning.

At the request of instructors in the special training courses for members of the armed forces, the society issued two volumes of reprints of articles originally published in the *Geographical Review* under the titles of "Readings in the Geography of France, Germany, Flanders and the Netherlands" and "Readings in the Geography of the Mediterranean Area" and also republished a volume by its director, Dr. John Kirtland Wright, entitled "The Geographical Basis of European History," originally published in 1928 by Henry Holt and company.

At the suggestion of the commission on cartography of the Pan American Institute of Geography and History, the society sponsored and issued invitations to a consultation on geodetic surveying, aeronautical charts and topographic maps held in Washington and New York Sept. 29 to Oct. 14 and attended by representatives of the official mapping agencies of the governments of the South American republics, Mexico and Canada.

The society awarded two of its gold medals in 1943—the Cullum Geographical medal to Arthur R. Hinks, for 30 years secretary of the Royal Geographical society of London, and the Charles P. Daly medal to Sir Halford J. Mackinder, noted British political geographer. Dr. Christovam Leite de Castro, secretary-general of the National Council of Geography of Brazil, and Señor Manuel Medina, chief of the office of geography of the Mexican government, were elected honorary corresponding members.

The society's annual book publication was *Mirror for Americans: Likeness of the Eastern Seaboard, 1810,* by Professor Ralph H. Brown of the University of Minnesota—a portrait of the eastern seaboard of the United States a century and a quarter ago based on an exhaustive study of contemporary materials and written in the style of the period as from the hand of an imaginary contemporary geographer. In addition there was published a study of the geography, strategic position, resources, trade, etc. of Japan at the outbreak of the war by Professor Guy-Harold Smith of Ohio State university and Dr. Dorothy Good of the society's staff under the title *Japan: A Geographical View.*

In the *Geographical Review,* the society's quarterly journal, special attention was given to articles, book reviews, and notes on areas and topics of interest in connection with the war. Publication was continued of *Current Geographical Publications*—a classified list of books, articles, maps and photographs of geographical interest selected monthly for inclusion in the society's research catalogue and photograph index. (R. R. P.)

American Indians: *see* INDIANS, AMERICAN.

American Iron and Steel Institute.

Most of the activities of the American Iron and Steel institute during 1943 continued to relate directly or indirectly to the steel industry's contributions to the U.S. war effort. Through its committees formed of executives, operating men and technicians of companies in the steel industry, it served as a ready and efficient liaison between war agencies and steel producers. Another long-established institute activity, the collection and compilation of iron and steel statistics, likewise proved valuable to war agencies.

Among the most significant activities during 1943 were the accomplishments of certain committees in connection with the further development of alloy steels for war uses, and the preparation and publication of a manual of packaging and loading standards for overseas shipment of steel products. Publication of the packaging manual culminated three years of intensive research into the problem of delivering steel mill products overseas in first-class condition under even the most severe conditions of wartime transportation. (W. S. To.)

American Law Institute.

Since its organization in Feb. 1923, the chief work of the American Law Institute has been a *Restatement of the Law,* best described as an orderly statement of the common law. While the sections into which the restatement is divided are written in statutory form, they are not presented to legislatures for adoption. The object of the restatement is to clarify and simplify the common law, but not to prevent its continued development by judicial decision. Prior to 1942, 16 volumes of the restatement were published, including the law of contracts, conflict of laws, agency, trusts, restitution, torts and security, besides large portions of the law of property.

During 1943 work on the fourth and fifth volumes of the restatement of the law of property went forward, as also did work on the sales division of the Code of Commercial Law, and on an international bill (declaration) of rights to further education on postwar problems and for possible use in the postwar settlement.

Aside from the official members—those holding the leading judicial, bar and law school faculty positions—there were in 1943, 825 life members, membership being a distinct professional honour. The governing body is a council of 33. The members meet each year in Washington, D.C. All legal and other official publications of the institute must be first approved by the council and by a meeting of members. The president in 1943 was George Wharton Pepper; William Draper Lewis was director and chief of the editorial staff. The executive office was in 1943 at 3400 Chestnut st., Philadelphia, Pa. (W. D. L.)

American Legion.

An organization of American veterans of both World Wars I and II. It was originally chartered as a World War I veterans' organization by congress in 1919. It became a two-war organization Oct. 29, 1942, when President Roosevelt signed Public Act 767, making honourably discharged veterans of World War II eligible for membership.

The accomplishments of the American Legion in 1943 included: (1) launching of a vigorous fight on behalf of disabled veterans of World War II, particularly battle casualties, to eliminate the delays ranging from 3 to 11 months in the settlements of their rightful claims for government compensation following their discharges from hospitals; (2) giving leadership by national convention action to public opinion that American postwar foreign policy must be one of participation in the establishment and maintenance of an association of free and sovereign nations, implemented by whatever force may be necessary to maintain world peace and prevent a recurrence of war; (3) creation of an American Legion postwar planning commission; (4) authorization and setting up of the machinery for raising an Americanism endowment fund of $10,000,000 or more by public subscription, to aid in the preservation of the American way of life; (5) setting up a comprehensive program of services to the members of the armed forces and their families, financed by an appropriation of $250,000.

Other 1943 achievements were: (1) designation of the major legislative program for 1944 to be universal service in time of war, adoption of a permanent policy of universal military training, postwar planning, and adequate protection of disabled veterans of World Wars I and II and their dependents; (2) taking a firm stand that all governmental functions concerning or affecting war veterans of the United States be unified and placed under the exclusive control of the Veterans' administration, and that all legislation relating to war veterans should be considered by single committees in the house of representatives and the senate; (3) launching by official government request of a nationwide "America Alert" program to impress upon all citizens that the end of

WARREN H. ATHERTON, elected president of the American Legion Sept. 23, 1943

the war is not in sight, that the signal for the relaxation of the war effort on the home front must come from the battlefronts, and that the necessity of protection through civilian defense is continuous until the end of the war; (4) maintenance despite war conditions of youth-training programs such as junior baseball, Boys' States, national high school oratorical contest, and others, to build character for future good citizenship; (5) launching of a program of visual parent education in the wartime care of children to combat the spread of juvenile delinquency; (6) selling hundreds of millions of war bonds and stamps through Legion drives; (7) distribution to members of the armed forces abroad of more than a million decks of playing cards collected by the Legion's fun and honour society, the Forty and Eight; (8) furnishing approximately 18,000 sets of new records, 48 records to the set, to members of the armed forces abroad for their entertainment, as the result of shellac made available through hundreds of thousands of old phonograph records collected over the nation; (9) drafting an orderly program of demobilization with recommendations for muster out pay, vocational training, and placing of honourably discharged veterans into jobs without unnecessary delays; (10) continuation of its normal child welfare, rehabilitation, Americanism and community service activities.

All membership records of the American Legion again were broken during 1943. On Dec. 31, 1943, a new all-time high enrolment of 1,172,971 members was reached. At the same time the number of posts rose to a new high of 11,941. The American Legion auxiliary showed a membership of 534,630 in 9,375 units. The Sons of The American Legion closed the year with an enrolment of 37,267 in 3,488 squadrons. The Forty and Eight membership rolled to a new high of 48,971 in 717 voitures. The Eight and Forty also broke all former records with a membership of 8,300 in 300 salons.

At the annual national convention in Omaha, Neb., Warren H. Atherton, Stockton, Cal., attorney, was elected national commander. (W. H. AN.)

American Library Association. Established in 1876, the A.L.A. is the official organization in the United States and Canada of librarians and others interested in the educational, social and cultural responsibilities of libraries. It is affiliated with more than 50 other library associations in the United States and other countries and works closely with many organizations concerned with education, recreation, research and public service. Its activities were carried on in 1943 by a headquarters staff of 76 persons and by more than 80 committees and boards of over 600 volunteer workers, all interested in various aspects or types of library service. Its program includes information and advisory services, personnel service, field work, annual and midwinter conferences, and the non-profit publication of numerous professional books and pamphlets. It publishes also the following periodicals: *A.L.A. Bulletin, Booklist, College and Research Libraries, Hospital Book Guide, Subscription Books Bulletin* and *Journal of Documentary Reproduction*, the latter discontinued for the duration of World War II. Althea H. Warren, Public library, Los Angeles, Calif., was president, 1943–44. The headquarters are located at 520 North Michigan avenue, Chicago, Illinois, with a newly established International Relations office in the Library of Congress annex, Washington, D.C., made possible through a Rockefeller foundation grant.

The association's income in 1942–43 (excluding cash balance of $88,000 on Sept. 1, 1942) was $639,500. Income from membership dues, conference, sale of publications, advertising, subscriptions, etc. was about $170,000; $391,000 came from outside sources in the form of grants for special purposes, and $78,500 was endowment income. The association's endowment was approximately $2,111,900.

Because of the war, the usual conferences were not held in 1943, but a National Institute on war and postwar problems and issues was conducted in Chicago, Jan. 30–31, 1943, followed during the year by 18 regional and numerous local institutes throughout the country. The annual Newbery medal was presented to Elizabeth Janet Gray for her children's story, *Adam of the Road*, and the annual Caldecott medal to Virginia Lee Burton for her picture book, *The Little House*. The annual trustee citations of merit were presented to Mrs. George H. Tomlinson, trustee of the Evanston (Ill.) Public library and Ora L. Wildermuth, trustee of the Gary (Ind.) Public library.

A "Conference in Print" was planned for early 1944, with librarians and others offering suggestions and conducting discussions in the *A.L.A. Bulletin* on the theme "Preparing for Postwar Library Service."

Among the studies and projects under A.L.A. supervision for 1943–44 were: a survey of resources of the principal libraries in the Kansas City area, preparatory to the establishment of a new library; a survey of the U.S. Army Medical library under a grant from the Rockefeller foundation; the preparation of an extensive guide to comparative literature and understanding in co-operation with the American Association of Colleges and the National Council of Teachers of English; a study of war activities of college and research libraries to augment 1942's similar survey of public libraries; the publication of a report "Government Publishing in Wartime," following a complete study of the subject, which was submitted to the office of war information as a program for action; reviewing of the problems of priorities, manpower and related subjects in co-operation with the Library Service Division of the Office of Education; and the publication of three volumes on *Classification and Pay Plans for Libraries in Institutions of Higher Education* following the study in 1942 on pay plans for public libraries.

A.L.A. also sponsored or assisted with the following war and

postwar activities: the Victory Book campaign through which some 17,000,000 books were collected in two years; the publication of book lists, studies, plans and surveys on war related subjects, including *Post-War Standards for Public Libraries,* to serve as the basis for postwar library planning in this field as would similar plans in process for school, college and university libraries; and the *Library War Guide,* issued monthly by OWI and describing ways in which libraries could further the government war program.

With recommendations from A.L.A., OWI established United States reference libraries in London, England; Sydney and Melbourne, Australia; Wellington, New Zealand; Johannesburg, Union of South Africa; and Bombay, India. These libraries were designed to serve writers, the press, radio, U.S. missions, local government agencies, educational, scientific and cultural institutions and organizations.

Among the A.L.A.'s international activities are the direction of the American libraries in Mexico City, Managua, and Montevideo; the administration of a grant of $150,000 for the purchase of books by U.S. authors to be sent to Latin American libraries; the collection of some $160,000 worth of scholarly American periodicals to assist in replenishing libraries in foreign countries following the war; plans, surveys and studies regarding international postwar co-operation among libraries; the sponsorship of British Book Week, Oct. 24 to 30, 1943, as a reciprocal gesture to British libraries, which had purchased $100,000 worth of U.S. books to interpret the United States to the British people; the maintenance of close co-operation between the Library Association of Great Britain and other foreign libraries; and the assistance given to various libraries of Latin America, particularly the National library of Peru, which was destroyed by fire on May 10, 1943. (M. O. P.)

American Literature. The new books of 1943 in the U.S. revealed the strong development of several tendencies that either had been marked or foreshadowed in the preceding year. Of immediate interest to the reader was the great increase of books dealing with the war and written both by correspondents and men in the armed services. They showed that the time between the planning, writing and publication of a book had been materially reduced, that the authors were free to write anything that did not injure military plans and that World War II was being reported more fully than any war in history. The illustrations were copious and took full advantage of the strides in photography. Next in importance came discussion of American policy and books in this category, especially Wendell Willkie's *One World* and Walter Lippmann's *U. S. Foreign Policy,* attained larger circulation than any one war book. Allied with this was the growth of sympathetic interpretation of Russian affairs, in which Mr. Willkie's book was an influence. Then came the rise in the number of technical manuals and popular discussions of mechanical subjects, especially those devoted to constructing and flying aeroplanes. Finally the acceleration of a new religious and spiritual interest was marked. At the end of the year it appeared that the flood of new technical works had passed its peak and that they would suffice, except for necessary revisions, for the needs of students and industry. The Russian trend, however, pointed to an increase in books on this subject and the events of the war and discussions of postwar plans were bound to keep the number of books on these subjects unusually high, though publishers, hard-pressed for white paper, were inclined to adopt a more selective attitude toward the end of the year.

The War.—Never before has news of fighting been brought so fully and so quickly to the civilians back home. War correspondents led in this with *Battle for the Solomons* by Ira Wolfert; *Guadalcanal Diary* by Richard Tregaskis; *Retreat with Stilwell* by Jack Belden; *Southwest Passage* by John Lardner; *Grim Reapers* by Stanley Johnston; *Singapore Is Silent* by George Weller. The experiences of soldiers in Africa were reported sympathetically by Ernie Pyle in *Here Is Your War,* while Ralph Ingersoll described the observations of a captain of engineers in *The Battle Is the Pay-Off.* How Americans defended their posts was the subject of *Last Man Off Wake Island* by W. L. J. Bayler and Cecil Carnes, and Col. Robert L. Scott, Jr., wrote the best book of aviation experiences in *God Is My Co-Pilot.* The rescue of the party led by Capt. Eddie Rickenbacker was fully described in two books, including Rickenbacker's own *Seven Came Through.* Lieut. Juanita Redmond wrote *I Served on Bataan* and Carlos P. Romulo, Manila newspaper owner and Pulitzer prize winner for reporting, told his dramatic story in *I Saw the Fall of the Philippines.* Other books gave personal experiences with the Japanese, including *Tokyo Record* by Otto D. Tolischus; *Exchange Ship* by Max Hill; *My War with Japan* by Carroll Alcott; *Hong Kong Story* by Gwen Dew and *Shanghai Lawyer* by N. F. Allman. An account of the preparations for bombing Tokyo and the flight from the "Hornet" was the subject of Capt. Ted W. Lawson's *Thirty Seconds Over Tokyo.* Walter Simmons recorded the personal story of *Joe Foss, Flying Marine.* The Aleutian campaign was represented in *Bridge to Victory* by Howard Handleman, while Robert Carse described the merchant marine in *Lifeline.* A man of peace, Archbishop Francis J. Spellman of New York, journeyed through the lines and told the story of his trip to Africa, Rome, Spain, etc., in *Action This Day.* And when Lieut. John Mason Brown, U.S.N.R., published *To All Hands,* the public could read the talks broadcast on board ship during the Sicilian adventure.

In many instances books of observation and experience also promoted points of view and practically every correspondent who expressed himself on the subject favoured international co-operation after the war. Among the best eye-witness accounts of Russia in wartime was *Moscow Dateline* by Henry C. Cassidy. Russia was an important subject in Wendell Willkie's *One World* and Eve Curie's *Journey Among Warriors,* while personal experiences formed the basis of *Round Trip to Russia* by Walter Graebner, *Twelve Months That Changed the World* by Larry Lesueur and *Dynamite Cargo: Convoy to Russia* by Fred Herman. Maurice Hindus added another sympathetic book about the Russian people in *Mother Russia.* Analytical books also had their place: Albert Rhys Williams published *The Russians: the Land, the People and Why They Fight;* William Henry Chamberlain, author of a conservative study of soviet Russia wrote *The Russian Enigma;* David J. Dallin, one-time member of the revolutionary government added *Russia and Postwar Europe* to his earlier study of soviet foreign policy. Repercussions of communist policies in the United States were discussed in *America, Russia and the Communist Party in the Postwar World* by John L. Childs, George S. Counts and other critics of communism. *Ancient Russia* by George Vernadsky was the first volume in a series of histories; a translation was also published of Paul Miliukov's *Outline of Russian Culture.* Collections of contemporary and classical Russian literature were edited by Mark Van Doren, Ivar Spector, John Cournos and Bernard Guilbert Guerney, and new editions of works by Tolstoy and Dostoievski were published in the United States.

An argument for international co-operation was presented by John T. Whitaker in *We Cannot Escape History.* Thomas J. Hamilton criticized American policies toward Spain in *Appeasement's Child: the Franco Regime in Spain.* With American correspondents withdrawn from Germany, the eye-witness accounts of life there decreased, but books reflected information

received from underground sources in the occupied countries, of which one of the most remarkable was Etta Shiber's account of how she helped rescue nearly 200 British soldiers from the nazis in *Paris Underground*. Other authors were busy discussing nazi methods and postwar attitudes toward Germany. Frank Munk exposed totalitarian economic methods in *The Legacy of Nazism*. Heinz Pol explained the German threat to postwar peace in *The Hidden Enemy*. Helmut Kuhn, another refugee teaching in the United States, wrote *Freedom Forgotten and Remembered*. A searching study of propaganda was made in *The Goebbels Experiment* by Derrick Sington and Arthur Weidenfeld. Bernadotte E. Schmitt asked pointedly: *What Shall We Do With Germany?* Adolf Sturmthal showed the menace of totalitarian methods in *The Tragedy of European Labor, 1918–1939*. The nazi treatment of a peaceful people was described in *Juggernaut Over Holland* by its foreign minister, Eelco N. van Kleffens. In addition to these and many similar studies one publisher sponsored *Hitler's Speeches*, a complete translation, edited by Norman Baynes with a foreword by Lord Astor.

Louis Adamic precipitated a bitter controversy among Yugoslavs by supporting Tito and his partisans in *My Native Land*. Betty Wason gave an excellent account of Greece in *Miracle in Hellas*, while Agnes Smedley in *Battle Hymn of China*, gave a remarkable first-hand account of the endurance and suffering of the Chinese soldier.

An earnest attitude toward American problems, foreign and domestic, distinguished both writers and readers. That publishers were not always aware of the eagerness of the public was proved by the delay attending the publication of *Under Cover: My Four Years in the Nazi Underworld of America* by John Roy Carlson (pseud.). A number of publishers refused to print the book because they thought the subject-matter had been fully reported in the newspapers, yet when issued the book sold half a million copies in a few months and continued selling in large editions well into 1944. But only a few readers heard about *Alien Enemies and Alien Friends in the United States*, by Ernst W. Puttkammer. Henry A. Wallace, vice-president, elaborated his theory of postwar plans in *The Century of the Common Man* and two separate publications were made of *The World of the Four Freedoms* by Sumner Welles, one with an introduction by Nicholas Murray Butler. One of the most persistent publicists for a postwar plan was the card expert, Ely Culbertson, who presented his ideas in *Total Peace*. Carl Sandburg's running comment on American affairs appeared as *Home Front Memo*. Among many books attention was given *The Postwar Plans of the United Nations* by Lewis L. Lorwin; *The Peace We Fight For* by Hiram Motherwell; *Make This the Last War* by Michael Straight; *Preview of History* by Raymond Gram Swing; *The Road to Peace and Freedom* by Irving Brant and *Building for Peace at Home and Abroad* by Maxwell S. Stewart. American political and social ideas and ideals found a brilliant exposition in a Socratic dialogue by Charles A. Beard called *The Republic: Conversations on Fundamentals*. Gustavus Myers, who pioneered years ago with his *History of the Great American Fortunes*, did not live to see the publication of his *History of Bigotry in the United States*.

Contemporary America was closely examined in numbers of books. *The Tennessee Valley Authority* by C. Herman Pritchett, *Radio Networks and the Federal Government* by Thomas Porter Robinson, *The Economic Control of the Motion Picture Industry* by Mae D. Huettig and *The Impact of Federal Taxes* by Roswell Magill discussed four important subjects of the day. A ripple of interest followed publication of an argument for primitive treatment of the soil in *Plowman's Folly* by Edward H. Faulkner. William R. Van Dersel issued *The American Land, Its History and Its Uses*. Industrialists eager for a return to uncontrolled competition found something to worry about in *Business as a System of Power* by Robert A. Brady, with a foreword by Robert S. Lynd, a consideration of the totalitarian menace hidden in big business enterprises. How the newspapers served the nation in wartime was described by many writers in *Journalism in Wartime*, edited by Frank Luther Mott. *American Society in Wartime* was similarly edited by William F. Ogburn.

With so much concentration on modern problems history seemed to mark time and few books attained prominence, although publishing records show that 465 new titles of historical works were registered for copyright. Many, however, were in the textbook field. Biography is the major element in *Lee's Lieutenants: A Study in Command* by Douglas Southall Freeman, but the personalities and events are so intertwined that it was also the best work of the year in American history. Mr. Freeman completed the second volume: *Cedar Mountain to Chancellorsville*. Carl Van Doren's *Mutiny in January* described a Revolutionary episode from documents made available for the first time. Bernard de Voto described many dramatic episodes in *The Year of Decision: 1846*. History, biography and autobiography were happily combined by Vincent Sheean in *Between the Thunder and the Sun. Lincoln and the Patronage* by Harry J. Carman and Reinhard H. Luthin explored a political phase of Lincoln's career, and *Swedish Immigrants in Lincoln's Time* by Nels Hokanson showed where Lincoln obtained some of his support. *The Third Term Tradition; Its Rise and Fall* by Charles W. Stein closed a long debate. American mercantile history was represented by *A History of Macy's of New York, 1858–1919* by Ralph Merle Hower and aviation by *The First Century of Flight in America* by Jeremiah Milbank, Jr.

Biography and Autobiography.—Books in this category seemed to attain a higher level of writing than fiction. Books with a special meaning for intellectuals included *Connecticut Yankee* by Wilbur Lucius Cross, Yale educator and three times governor, who traced the changing educational and social life of New England. There were also *A Threshold in the Sun* by Lloyd Morris, filled with literary memories and modern points of view; *The World of Yesterday*, a brilliant analysis of the cultural twilight of Austria, completed just before despair drove the author, Stefan Zweig, out of this world. John Erskine's *The Complete Life* might be termed cultural guidance based on personal experiences. Albert J. Nock, a writer with strong classical convictions, called his unenthusiastic commentary on contemporary affairs *The Memoirs of a Superfluous Man*, while Harold L. Ickes, secretary of the interior, wryly called his memoirs of political controversy *The Autobiography of a Curmudgeon*. Ferris Greenslet, a Boston publisher, wrote more cheerfully about books, authors and fishing in *Under the Bridge*, while Albert Spalding, violinist, recalled the brilliant musical life of Europe in prewar days in *Rise to Follow*. The appearance of Sir Thomas Beecham as conductor of opera and orchestras lent interest to his own story, *A Mingled Chime*. Education and affairs were described by Henry Johnson in *The Other Side of Main Street; a History Teacher from Sauk Center* and Stephen Duggan's *A Professor at Large*. Social history was recorded in *Exploring the Dangerous Trades* by Alice Hamilton. Industry had its say in Tom Girdler's *Boot Straps*, in which he stoutly defended his policy of opposition to certain labour unions before the war. From far-off Asia a graduate of Johns Hopkins, Gordon S. Seagrave, now lieut. colonel of the United States medical corps, described his work under primitive conditions in *Burma Surgeon*, adding a chapter on his experiences in the Stilwell campaign. A Chicago man, Max Thorek, described his career in *A Surgeon's World*. One of the few autobiographical books with a touch of

THE BATTLE OF GUADALCANAL WON, U.S. marines lined the island's beaches in Feb. 1943 to board barges carrying them to troopships. A detailed story of the battle was the subject of Richard Tregaskis' *Guadalcanal Diary*, an outstanding U.S. war book of 1943

wit was H. L. Mencken's *Heathen Days*. An exciting life in many fields was revealed by C. Kay-Scott in *Life Is Too Short;* Lee Simonson described his career of designing for the theatre in *Part of a Lifetime;* Edward R. Hewitt, son of Abram S. Hewitt and himself an inventor of prominence, recalled New York experiences in *Those Were the Days,* while Roy Chapman Andrews recalled the happy experiences of a naturalist in *Under a Lucky Star.*

In biography half a dozen books dealt with phases of the life and writings of Thomas Jefferson, prompted by the 200th anniversary of his birth, which fell on April 13, 1943. None, however, was a work of lasting value. Saul K. Padover, who had published a biography of Jefferson in 1942, issued *The Complete Jefferson,* but despite its usefulness for reference purposes it was not complete. *The Philosophy of Jefferson,* by Adrienne Koch, won the Woodbridge prize in philosophy at Columbia university. Work of varying quality included *Jefferson: the Road to Glory* by Marie Kimball; *Thomas Jefferson* by Hendrik Van Loon, with his characteristic drawings; *Jefferson Himself* edited by Bernard Mayo, and *Thomas Jefferson, Then and Now,* a "national symposium" edited by James Waterman Wise. Princeton university and the New York *Times* announced that they would sponsor a project to publish the writings and letters of Jefferson in many volumes, with the co-operation of a committee of historians and representatives of learned societies.

Original work in biography was done by Rackham Holt in *George Washington Carver,* a sensitive study of the Tuskegee scientist. *Walt Whitman, an American* by Henry Seidel Canby, was a rational interpretation of the man and his poems and in effect also a study in criticism; the author contended that theories of an abnormal sex life remained unproved. In *Pioneer to the Past* Charles Breasted described the career of his father, James Henry Breasted, the archaeologist. Henry Knox Sherrill, bishop of Massachusetts, wrote sympathetically of his predecessor in *William Lawrence: Later Years of a Happy Life.* A Confederate statesman received another biography in *Judah P. Benjamin* by Robert Douthat Meade. A man who contributed to American culture was remembered in *Charles T. Griffis: The Life of an American Composer* by Edward M. Maisel; Mortimer Smith wrote *The Life of Ole Bull,* and E. E. Reynolds published *Baden-Powell.* Isaac Don Levine wrote an authorized biography in *Mitchell: Pioneer of Air Power,* and Helen Jones Campbell practically vindicated the accused in *The Case for Mrs. Suratt.* Of minor interest were *Henry Ford* by William A. Simonds; *Mark Twain, Man of Legend* by Delancey Ferguson and *Young Lady Randolph* by Rene Kraus. Both biography and history were served in *The Wright Brothers* by Fred C. Kelly, in which he argued the case of priority in aeroplane invention for the Wrights. A man of the early republic was recalled in *Benjamin Tallmadge* by Charles Swain Hall. Raymond B. Nixon described a famous orator in *Henry W. Grady, Spokesman of the New South,* and Arthur Upham Pope praised a contemporary diplomat in *Maxim Litvinoff.*

Criticism, Belles Lettres and Scholarly Studies.—Few books of criticism were published in 1943, though many essays appeared in periodicals. Ellen Glasgow interpreted her ideals in writing in *A Certain Measure,* originally published as prefaces to her novels. Lionel Trilling's *E. M. Forster* and Edward Wagenknecht's *Cavalcade of the English Novel* were scholarly works. Alden Brooks in *Shaksper and the Dyer's Hand* presented the Elizabethan poet Dyer as his candidate for the authorship of Shakespeare's plays. More conservative was the approach of W. W. Greg in *The Editorial Problem in Shakespeare; a Survey of the Foundations of the Text* and Oscar James Campbell in *Shakespeare's Satire.* Edmund Wilson wrote a critical introduction for an anthology, *The Shock of Recognition;* and Max Lerner edited a collection called *The Mind and Faith of Justice Holmes.*

Romanticism and the Modern Ego by Jacques Barzun was a work of original thinking and forceful writing. Also an original contribution was *The World of Sholom Aleichem* by Maurice Samuel. Other scholarly publications included *Free Minds: John Morley and His Friends* by Frances Wentworth Knickerbocker; *Francis Bacon on Communication and Rhetoric* by Karl R. Wallace; *This Is Lorence,* an interpretation of Laurence Sterne by Lodwick Hartley; *The Great Age of Greek Literature* by Edith Hamilton. Critical analysis and interpretation of American phenomena were contained in *American Heroes and Hero Worship* by Gerald W. Johnson; *The Hero in History, a Study in Limitation and Possibility* by Sidney Hook; *Love in America* by David L. Cohn. Reinhold Niebuhr published the second volume of his *The Nature and Destiny of Man: A Christian Interpretation* and Jacques Maritain, now residing in the United States, published *The Rights of Man and Natural Law.* James Burnham presented new points of view in *The Machiavellians: Defenders of Freedom.* Unique in its field was Pál Kelemen's *Medieval American Art,* a two-volume survey of aboriginal

culture, with many illustrations, which had been ten years in the making. The attention given Mark Van Doren's argument for a stronger classical basis of education in *Liberal Education* demonstrated the growing interest of the public. A conservative argument was also advanced by Jacques Maritain in *Education at the Crossroads*. Akin to this was *Science and Criticism; the Humanistic Tradition in Continental Thought* by Herbert J. Muller. Werner Jaeger, now of the Harvard faculty, published the second and third volumes of *Paideia: The Ideals of Greek Culture*. A new Biblical study was published by Edgar J. Goodspeed: *The Goodspeed Parallel New Testament*, giving the King James version and the American translation. The war did not interfere with the publication of *The Oxford Book of German Prose*, from Luther to Rilke, edited by H. G. Fiedler. And while Henry Hitch Adams wrote *English Domestic or Homilectic Tragedy, 1575 to 1642*, Barrett H. Clark exhumed thrillers by Bartley Campbell, Boucicault and Belasco in *Favorite American Plays of the Nineteenth Century*. A modern interpretation of 19th century fiction was to be found in *The Psychiatric Novels of Oliver Wendell Holmes* by Clarence B. Oberndorf.

Poetry.—Stephen Vincent Benét was writing a book-length poem about the rise of the American spirit when he died and his incomplete work, published as *Western Star, a Fragment*, showed how important the book would have been. *This Is My Beloved*, a book of love poems by Walter Benton, attained some popularity. Louis Untermeyer published a selection of poems by Robert Frost, with comment, in *Come In*. *Genesis* by Delmore Schwartz was the contribution of a younger man. In *Twelve Spanish-American Poets* H. R. Hays turned to the southern continent, while A. J. M. Smith edited a critical anthology called *The Book of Canadian Poetry*. Kenneth Fearing published *Afternoon of a Pawnbroker and Other Poems*. A selection of poems by Edna St. Vincent Millay was published as *Collected Lyrics*. Oscar Williams edited *New Poems, 1943*, an anthology of British and American verse. The Yale Younger Poets award went to Lieut. William Meredith for *Love Letters from an Impossible Land*.

Fiction.—Interest in American life overshadowed all other themes, including the historical. Conditions among the lowly were prominent in several distinguished first novels. Betty Smith (Mrs. Joseph Jones) portrayed many episodes in the life of a growing girl in *A Tree Grows in Brooklyn*, incorporating many bits of metropolitan folklore; it is revealing to know that she was attracted to her theme by reading Thomas Wolfe on Brooklyn life. Bucklin Moon, in *The Darker Brother*, succeeded in maintaining a proper balance between sympathy and curiosity in telling how a young Negro in Harlem is affected by white barriers. Ira Wolfert, war correspondent and author of *The Battle of the Solomons*, showed his knowledge of city exploiters in *Tucker's People*, which won a favourable critical press but no large sales. A writing talent of promise stands revealed in *Heaven Is a Sun-swept Hill*, a novel about the stamina of settlers in the flooded districts of the Mississippi river; a tragic note intruded because its author, Earl Guy, was serving a long prison term. Another new novelist of promise is Alexander Saxton, who wrote *Grand Crossing*. None of these books, however, caught the turmoil of the human heart in wartime as well as a novel by a refugee, *Arrival and Departure* by Arthur Koestler, which caused much American discussion despite its lack of clarity.

Older writers were also interested in American social conditions. These were implicit in Wallace Stegner's story of a misfit American, *The Big Rock Candy Mountain*, which showed this author digging deeper for his material but failing to make his characters memorable, and in Robert Penn Warren's novel about a southern community, *At Heaven's Gate*, in which the story was handicapped by a confusing technique. *Lilly Crackell* by Caroline Slade was practically a well-authenticated document of the effect of slum beginnings on a girl. James T. Farrell added another novel to his Chicago series in *My Days of Anger* and Erskine Caldwell repeated his familiar manner in *Georgia Boy*. American careers furnished the backgrounds for two semi-autobiographical novels, *Never Call Retreat* by Joseph Freeman, and *Journey in the Dark* by Martin Flavin, which won the Harper prize in fiction. *A Time to Live* by Michael Blankfort traced the career of a young liberal who found it impossible to trim his thinking to political expediency. Louis Bromfield added *Mrs. Parkington* to his gallery of resourceful women. Sinclair Lewis, returning to his early manner of treating an American institution ironically through one of its representatives, wrote only a minor novel in *Gideon Planish*, the story of a money-raising publicist. Writers exiled from their homelands and now living in the United States produced several novels with European backgrounds; Lion Feuchtwanger ridiculed Hitler's soothsayer in *Double, Double, Toil and Trouble* without writing a novel comparable with his early work, and Mark Aldanov wrote *The Fifth Seal*, which, because of the implied criticism of soviet diplomacy in Paris, caused a nine-day's protest from interested partisans in the United States; the novel, however, did not warrant unusual attention. Admirers of William Saroyan's writings found *The Human Comedy* filled with their favourite characters and the romantic warmth and good feeling displayed by no other author. Booth Tarkington painted the portrait of a kind woman in *Kate Fennigate;* Robert Nathan gave a touch of mysticism to the story of a farmer soldier in *But Gently Day;* Mary O'Hara added *Thunderhead*, the story of a stallion, to her widely acclaimed story of a boy and a horse, *My Friend Flicka*, of 1941. Pearl S. Buck's *The Promise* was deeply critical of the conduct of the Burma campaign. John Dos Passos described a cheerful and corrupt politician in *Number One*. Jesse Stuart described Kentucky hill life with characteristic humour in *Taps for Private Tussie*, which won the Thomas Jefferson southern fiction award.

The major interest of novel readers was John P. Marquand's *So Little Time*, a novel about the attempts of a middle-aged man, a veteran of World War I and the father of a son eligible for World War II, to bring his life into focus with the changing life about him. It was widely approved by readers of the hero's generation, who saw in his difficulties many of their own. Entertainingly written, it did not, however, measure up to *The Late George Apley*, the prototype of this and similar Marquand novels.

When Sholem Asch wrote *The Apostle*, a novel based on the life of Paul of Tarsus, he added fuel to the growing interest in books about religious characters. His earlier novel, *The Nazarene*, was in steady demand throughout 1943. In *The Apostle* Asch followed the New Testament chronicles much more closely than in the former book. This produced argument in Yiddish literary circles of New York city and in the Yiddish-language press to which Mr. Asch contributes; in his zeal to bring about a closer understanding between Christianity and Judaism he did not have the full support of all believers. The Lloyd Douglas novel of 1942, *The Robe*, sold in large quantities in 1943, as did Franz Werfel's *The Song of Bernadette*, giving support to the theory that the spiritual hunger of the reading public was growing. The welcome given Dr. Harry Emerson Fosdick's *On Being a Real Person*, a discussion intended to give anchorage to the distracted individual, was also considered a straw in the wind. But the religious tendency is not always shown in stories about religious characters; it appears in the hope and faith expressed by laymen in articles and commentaries. It is marked in the writings of men dealing with the postwar world, in which faith in honesty, justice and the good intentions of a common humanity is a necessity.

(*See* also ENGLISH LITERATURE.) (H. HA.)

American Medical Association. In 1943, the American Medical association had more than 125,000 members out of about 155,000 doctors practising medicine in the United States, and 185,000 licensed to practise. The annual meeting of the house of delegates, in 1943, was in Chicago. The general session of the association was cancelled, but the 1944 session was scheduled during June in Chicago. The association had a gross income of approximately $2,000,000 annually. It is incorporated not for profit. The headquarters office is at 535 North Dearborn st., Chicago, Ill.

The association publishes the *Journal of the American Medical Association*, with a circulation of 107,000 weekly; *Hygeia*, with a circulation of more than 125,000 monthly, and medical journals in most of the medical specialties. The association also publishes the *Quarterly Cumulative Index Medicus*, which indexes regularly the contents of 1,400 medical periodicals, and a directory of United States physicians.

The library of the American Medical association conducts a package library service which sends articles and reprints to physicians to aid them in keeping up-to-date in medicine. Particularly requested in 1943 were articles on the sulfonamide drugs, penicillin, vitamins, industrial diseases, anaesthesia and the war.

Much of the work of the American Medical association is carried on by councils, including the council on pharmacy and chemistry which deals with drugs prescribed by doctors; the council on physical therapy which deals with physical apparatus, including eye glasses, hearing aids and devices for artificial respiration; the council on foods and nutrition which deals particularly with foods for special diets and foods for which medical claims are made; the council on industrial health which investigates industrial health service, standardizes health organizations, and advises on health problems in industry; the council on medical education and hospitals which investigates and rates medical schools and hospitals; the judicial council, which investigates charges of unethical conduct against physicians and medical organizations. Newly established in 1943 was the council on medical service and public relations, designed to analyze prepayment plans for medical service, group medical service and federal legislation relating to the medical profession, and to promote distribution of medical service and educate the public regarding medical service.

The bureaus of the American Medical association include the bureau of health education, which conducts radio programs, circulates pamphlets on health subjects and answers thousands of questions from the public; the bureau of legal medicine and legislation, which deals with standards of proposed federal and state legislation in the field of health, and analyzes court decisions on medical subjects; the bureau of medical economics, which makes available data on the economics of medical practice, makes surveys dealing with the distribution of physicians and prepayment medical service plans; the bureau of investigation, which studies quacks and nostrums; the bureau of exhibits, which provides exhibits for state and county medical societies, and national medical associations and many public agencies; the bureau of public relations, which distributes information regarding medical advancement and medical service to newspapers, magazines and other sources of information throughout the nation.

The association participated actively in the war effort through its committee on war participation, through the publication of the periodical called *War Medicine*, through the committee on postwar planning for medical service, and through membership of its executives on many advisory bodies in Washington, including the War Manpower commission, the division of medical sciences of the National Research council, National Roster of Scientific and Specialized Personnel, and the medical departments of the army and navy. In the headquarters office of the association an office of the War Manpower commission was maintained, charged with aiding in the procurement and assignment of physicians for the army, the navy, the public health service, industrial medicine and the civilian population. Ames, Joseph Sweetman (1864–1943), U.S. physicist and educator, was born July 3 in Manchester, Vt. Identified with Johns Hopkins university from his student days in 1883 until his retirement as president in 1935, Dr. Ames was best known for his aeronautical research. He was chairman of the National Advisory Committee for Aeronautics, 1927–39. He developed many safety and efficiency devices for aircraft, and in 1935 received the Langley gold medal of the Smithsonian institution, and the Sylvanus Reed award from the Institute of Aeronautical Sciences. He died in Baltimore, Md., June 24. (See *Encyclopædia Britannica.*)

Anaemia. In 1943 much attention was directed to erythroblastosis, haemolytic syndromes and shock in relation to haemorrhage. The Rh factor in blood received much study both as a transfusion hazard and in its role in the production of erythroblastosis foetalis.

The discovery of the relationship between Rh agglutinins and the production of erythroblastosis foetalis stimulated the study of this factor. Many new examples were reported, the majority of the cases showing Rh positive foetuses with Rh negative mothers who developed anti-Rh agglutinins. While the incidence of Rh negative individuals was reported as similar in England and in the United States, among the Chinese it was found to be 21 times less frequent, and erythroblastosis was rare among Chinese infants. Erythroblastosis was successfully treated with transfusions with Rh negative blood. The disease was found in one of twins. The excretion of bilirubin and urobilinogen and the cell measurements were reported as characterizing the anaemia as a haemolytic process.

The haemolytic reactions resulting from iso-immunization following repeated transfusions of homologous blood developed according to a mechanism similar to that affecting the erythroblastic foetus, and endangered the life of transfused, anaemic mothers.

The haemolytic anaemias received extensive study. Additional data were published on acute haemolytic anaemias in fertilizer workers (metallic poisoning), following cross-country runs, after sulfathiazole, sulfadiazine, sulfapyridine or sulfanilamide, in blackwater fever, and in a patient with auto-agglutination and hyperglobulinaemia.

A number of new studies of chronic haemolytic anaemia with paroxysmal nocturnal haemoglobinuria (Marchiafava-Micheli syndrome) were reported. There was no significant change in the pH of the blood during the day or night.

The survival time of normal erythrocytes injected into patients with familial haemolytic anaemia was normal, but red blood cells from an individual with acholuric jaundice were completely destroyed in 19 days.

Several factors on the relation of diet and haemolytic anaemia were noted. The anaemia produced by a *p*-aminoazobenzene was

prevented by a high protein diet. Increased erythrocyte destruction followed diets rich in fat. Rats fed high fat diets developed profound anaemia after trinitrotoluene poisoning, but not those on a high protein or high carbohydrate regime.

The blood volume was found to be low in chronic anaemia.

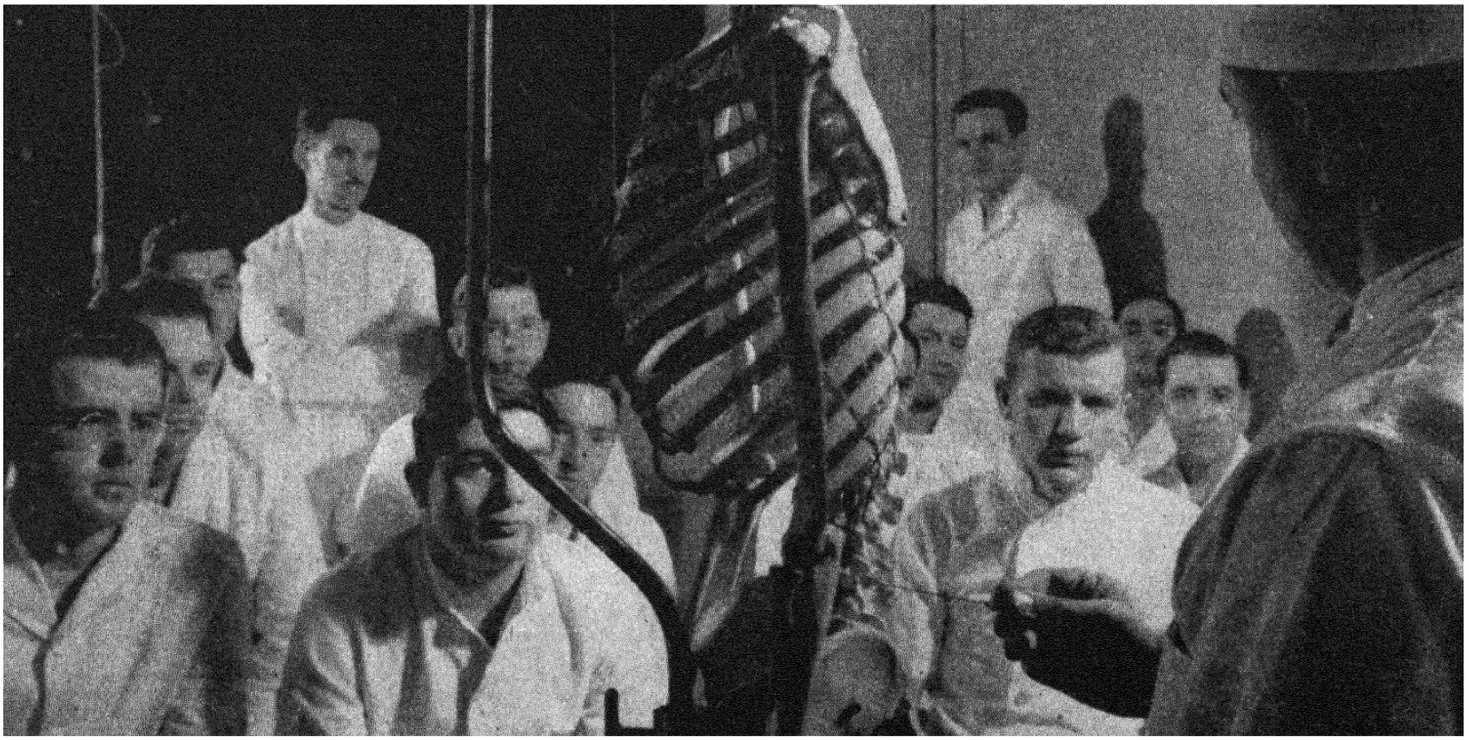
Dimorphic anaemia, a combination of deficiency of iron with a nutritional macrocytic anaemia, was described in Uganda. The anaemia of scurvy was found to be caused by generalized depression of erythropoiesis rather than a failure of maturation from a specific lack of vitamin C.

In hiatal hernia, 70% of the individuals showed some degree of hypochromic anaemia of haemorrhage, occasionally, however, of the pernicious anaemia type.

Aplastic types of anaemia were described after aspirin, antisyphilitic, sulfathiazole treatment, and from unknown causes.

Pyridoxine deficient diets produced a microcytic hyperregenerative anaemia in swine, corrected by pyridoxine administration. Vitamin B_6, a constituent of liver extract, cured anaemia of certain types in chicks. An erythropoietic substance developed in the serum of rabbits rendered anaemic by bleeding.

Surveys showed that the incidence of nutritional iron deficiency anaemia varied greatly in different communities (children, 1.5 to 85.0%; adults, 3.6 to 30.0%; pregnant women, 9.0 to 72.0%).



Haemorrhagic shock was found to be similar to shock from other causes. After a single, severe, non-fatal haemorrhage, haemodilution, with fall in the red blood cell volume, was most marked during the first hour but continued for 72 hours. The rate of haemoglobin regeneration with iron therapy after blood donation was found to decline gradually with successive haemorrhages until the rate was no more rapid than without iron. Bleeding, in thrombocytopenic conditions, was controlled by the oral use of pectin.

The use of concentrated red blood cell suspensions for transfusion in anaemia came into general use. A rise of approximately one gram of haemoglobin per 100 cc. followed the infusion of each 300 cc. of erythrocyte suspension, and the risk of a reaction from transfused iso-agglutinins was minimized. Universal group O cells suspended in pooled plasma reduced the number of reactions. Heparinized plasma was found to be the safest and most effective blood substitute, reducing the mortality from haemorrhage from 84 to 6%. The return of erythrocytes in animals so treated was not necessary for their survival.

Anaesthesia. The extensive use of intravenous anaesthesia, particularly with pentothal sodium, not only by civilian anaesthetists but by experienced anaesthetists of the medical corps of the army and navy, established that procedure on a firm basis and settled the controversy that was raised because of the unsatisfactory results of anaesthesia with pentothal sodium on casualties at Pearl Harbor. Pentothal may be used for persons in shock; the preliminary use of morphine and atropine reduces the dose of pentothal sodium necessary. Above all, the skill of the anaesthetist with pentothal sodium is the deciding factor in whether it should be used in cases of shock. Furthermore, the dose employed for patients in shock is small in contrast to that for a robust patient. The administration of 50% oxygen

U.S. MEDICAL OFFICER demonstrating how to administer spinal anaesthesia, at the Tilton General hospital in Fort Dix, N.J. The army medical corps instituted training programs for medical officers and enlisted men to make up for the shortage of anaesthetists in 1943

or 50% nitrous oxide combined with intravenous anaesthesia has furthered the use of this procedure.

Continuous caudal anaesthesia in obstetrics—the injection around the nerve roots at the lower end of the spine—suggested by R. A. Hingson and W. B. Edwards in Jan. 1942, was found not applicable to all women in labour; it depended for its success on the skill with which it was applied and a knowledge of the contraindications to its use. Infection had been one of the main hazards. Other hazards had been the production of spinal anaesthesia and the injection of the local anaesthetic agent into the blood stream. Needle breakage continued to occur and a small rubber catheter instead of a needle was one method suggested to prevent this. The introduction of continuous caudal anaesthesia, however, stirred everyone's interest in obstetric anaesthesia and much good should result from it in spite of the untoward results that were bound to occur owing to the unwise and unskilled use of this method in poorly selected cases.

In 1943 the army and navy of the United States and Canada continued courses of instruction in anaesthesiology for medical officers. The war demonstrated clearly the value of the physician anaesthetist. The usefulness of physician anaesthetists in providing supportive measures for patients in shock and their usefulness in connection with oxygen therapy and diagnostic and therapeutic blocks definitely established their importance in most military medical installations. The rosters of special societies for anaesthetists and the "Directory of Medical Specialists" in addition to the American Board of Anesthesiology, the subcommittee on anaesthesia of the National Research council and special societies were useful in the effort to distribute equitably the existing supply of trained anaesthetists between the military and civil practice. The co-operation of the senior consultants in anaesthesia of the allied forces resulted in a plan for the mutual collection of data that when compiled after the war should be extremely valuable.

In connection with the use of blood and plasma in the treatment of the anaesthetized patient in shock, the recognition of the Rh factor has been a most startling development.

In 1943 tentative plans were made for the allocation of anaesthetists to civil life at the termination of the war. The problem was not as great in this special field as it seemed to be in some of the other branches of medical practice. The scarcity of both physician and nurse anaesthetists was keenly felt in 1943, for never before had so much responsibility been assigned to the anaesthetist. (*See* also SURGERY.)

Anderson, Sir John (1882–), British cabinet member, was born July 8 in Scotland. He attended Edinburgh and Leipzig universities. He was first brought into public life by David Lloyd George and entered the British colonial office at the age of 23. He served as secretary of the important ministry of shipping, 1917–19. After World War I, he was a government "trouble-shooter" in Ireland and Bengal, where he employed strong measures to cope with unrest; he also served as chairman of the British board of inland revenue. He was permanent under-secretary of state for the home office, 1922–31, and governor of Bengal, 1932–37. Upon his return to England, he was elected to commons in 1938. With war impending, Anderson was made lord privy seal and minister of civilian defense, 1938, and was appointed secretary of state for home affairs, 1939. When Churchill became prime minister in 1940, he brought Sir John into his cabinet as head of the powerful home affairs committee, to which Churchill delegated responsibility for home front activities. Anderson also acted as head of the reconstruction priorities committee, charged with recommending postwar plans to the prime minister. After the death of Sir Kingsley Wood, Sir John was named chancellor of the exchequer, Sept. 24, 1943.

Anderson, Sir Kenneth Arthur Noel (1891–), British army officer, was born Dec. 25 and was educated at the Royal Military college, Sandhurst. Starting in the army as a 2nd lieutenant in the Seaforth Highlanders, 1911, he was wounded in World War I and was awarded the military cross. After the war, he advanced through the grades and was made major general in 1940.

In 1942 Gen. Dwight Eisenhower, U.S. commander of Allied forces in Africa, selected Gen. Anderson as one of his three task force commanders in French North Africa. Appointed acting lieutenant general, Gen. Anderson led the British 1st army to victory in the combined Allied campaign in North Africa, Nov. 1942 to May 1943. In July 1943 he was given the permanent rank of lieutenant general. A month later, in recognition of his services in the war, a knighthood was bestowed upon him. The United States also honoured him by making him a chief commander of the U.S. Legion of Merit.

Andrews, Charles McLean (1863–1943), U.S. historian and educator, was born Feb. 22, in Wethersfield, Conn. Dr. Andrews had retired from Yale as professor emeritus of American history in 1931, after an active teaching career of 42 years, and resigned from the editorship of Yale's Historical Publications in 1933. He afterwards completed work on his monumental four-volume *Colonial Period of American History* (1934–38), the first volume of which was awarded the Pulitzer prize in 1935. He edited with his wife Jonathan Dickinson's *God's Protecting Providence* (1942). Dr. Andrews died in New Haven, Sept. 9. (See *Encyclopædia Britannica.*)

Andrews, Frank Maxwell (1884–1943), U.S. army officer, was born Feb. 3 in Nashville, Tenn. He was graduated from West Point, 1906, became a cavalry lieutenant and was promoted through the grades to colonel in 1935. Gen. Andrews saw service in the Philippines, 1906–07, and in Hawaii, 1911–13. He was a major with the signal corps during World War I and served with the U.S. army of occupation in Germany, 1920–23. He was appointed temporary major general of the air corps in 1935 and major general commanding G.H.Q. air force, 1935–39. In Sept. 1941 he was promoted to the rank of lieutenant general and head of the Caribbean defense command and the Panama canal department. On Nov. 4, 1942, Gen. Andrews was given command of U.S. forces operating with the British in the middle east zone. On Feb. 5, 1943, he was named commander of all U.S. forces in the European theatre of operations, succeeding Gen. Eisenhower. An exponent of air power as an instrument of war equal in importance to land and sea power, Gen. Andrews was closely identified with the intensification of daylight raids on targets in occupied Europe by U.S. bombers. He was killed when a U.S. bomber in which he was a passenger crashed against a hillside in Iceland, May 3.

Angling. Salt-water fishing in the United States was restricted to a considerable degree by coast guard regulations, but during the latter half of 1943 some areas were reopened, principally in Florida and on the Pacific coast.

The tackle shortage became acute by late summer, and stocks

of rods, reels, hooks and lines were practically exhausted. But interest in angling was maintained at almost a normal level, due in part to the emphasis laid on fish as a valuable contribution to wartime menus. The sale of fishing licenses dropped only about 5% under the 1942 figure.

In the tournament field, activities were further reduced, but the National Association of Angling and Casting Clubs held its 35th annual tournament in Chicago on Sept. 4, 5, and 6. New records in both bait and fly casting were established.

Four new world's records were broken, three of them in salt-water angling. On March 14, B. D. H. Ross took a 1,000-lb. mako shark at Mayor Island, N.Z. The largest wahoo ever to be caught by an angler was landed at Greer cay, Bahamas, on June 15. This specimen, taken by K. L. Ames, Jr., weighed 133½ lb. A woman again made angling news by landing a huge channel bass weighing 67½ lb. She was 16-year-old Lucia D. Cosby, and her prize fish, which broke the women's rod-and-reel record, was taken at Chesapeake Bay, Va., on Aug. 25. Conversely, another woman lost her record. In 1942, Hazel Griffin broke an eight-year record by landing a wall-eyed pike which weighed 19 lb. 12 oz. On May 26, Patrick Noon surpassed this mark with a walleye weighing 22 lb. 4 oz., taken from the Niagara river, Ont. (W. J. SH.)

Anglo-Egyptian Sudan.

A territory under the joint sovereignty of Great Britain and Egypt in northeastern Africa, south of Egypt (*q.v.*). Area 967,500 sq.mi.; pop. (est. 1941) 6,370,041. Chief towns (pop. est. 1941): Khartoum (incl. Khartoum North) (44,950); Omdurman (116,196); Port Sudan (26,255); Atbara (19,757); El Obeid (39,887). Governor general: Lt. Gen. Sir Hubert Huddleston; languages: English and Arabic; religion: Mohammedan.

History.—The political development of the Sudan registered an important advance in 1943. The earlier stages of this development may be recapitulated briefly. In 1922 had been enacted the first of a series of ordinances granting judicial powers to certain tribal heads. By 1932 by the Native Courts' ordinance this "devolution" policy had given the administration of civil and criminal justice to the local authorities. In 1937, by the Rural Areas ordinance, executive municipal and town councils were set up with administrative powers.

The government's 1943 legislation advanced a long step further. By its instrument provincial councils—partly nominated, partly elected—were advising provincial governors on important social and economic interests in the provinces.

Secondly, a central advisory council in Khartoum—again partly nominated, partly elected—was to be set up to advise the governor-general-in-council on matters affecting the government of the country as a whole.

Meanwhile, though the cost of living was about 170% above the 1939 figure, the economic situation of the country had been safeguarded. Additional wheat cultivation assured supplies guaranteeing self-support for the country without imports; while on the Gezira cotton plantations south of Khartoum land was made available for the production of increased maize supplies adequate to meet the requirements of the local population whose staple article of food it is. Nevertheless the Gezira cotton crop, harvested early in the year, was a bumper one and the treasury as well as the growers and the Sudan Plantations corporation all profited financially. (O. M. T.)

Education.—(Jan. 1, 1941) Government schools: elementary schools 137, scholars 17,184; intermediate schools 11, scholars 357; Gordon Memorial college, scholars 1,308; state-aided Kbranic schools 501, scholars 23,000; scholars at non-government (mission) schools 12,925.

Banking and Finance.—Revenue (1942) £E9,114,809; expenditure (1942) £E8,626,425; public debt (Dec. 31, 1942) £E9,435,898.

Trade and Communication.—In 1942 imports were valued at £E8,105,900; the value of exported merchandise amounted to £E7,085,107. Communications: roads, suitable for motor traffic, all weather, *c.* 1,000 mi.; railways 1,991 route mi.; river service 2,325 mi.; motor vehicles licensed (1937) 4,354 cars, commercial vehicles and cycles; telephone subscribers (1938) 2,383.

Agriculture and Mineral Production.—(1938–39) Production (in short tons): cotton seed (1940–41) 98,435; ginned cotton (1940–41) 54,674; millet (1937–38) 347,225; sesamum 36,596; maize 11,354; wheat 9,039; ground-nuts 9,480; barley 1,768; gold (1938) 252 kg.

Anthropology.

Anthropology during 1943 found increasing expression in war activities, though this did not prevent the maintenance of customary channels of communicating research findings, while certain gains of long-term value were registered.

The first of a new series of monographs published by the Viking fund appeared under the editorship of C. Osgood, and grants-in-aid for anthropological field work, offered by the same fund, of which P. Fejos was director of research, were announced. A new journal, *Acta Americana,* was launched under the editorship of R. Beals, as the organ of the Inter-American Society of Anthropology and Geography. The West China Frontier Research institute began a program of field studies under the direction of Li An-che; and an Institute of West African Arts, Industries and Social Science was made possible by a grant of £127,000 from the British treasury. It will be at Achimota, Gold Coast, and headed by M. Meyerowitz. Deering library, Northwestern university, acquired the library of the late Franz Boas, which was in 1943 installed as the Franz Boas Memorial Library and Anthropological Reprint Center.

A new program of African studies was initiated at Fisk university, and a Committee of African Studies instituted at the University of Pennsylvania. The South African journal *Bantu Studies,* which altered its title to *African Studies,* widened its scope. Anthropology in South Africa was further strengthened when Abbé Henri Breuil, distinguished French prehistorian, took up his duties as member of the Union's Bureau of Archaeology and honorary professor of archaeology at the University of the Witwatersrand. Activities of the International Institute for the Study of African Languages and Cultures, London, were resumed, and its journal, *Africa,* again began appearing regularly.

On Oct. 30, the Royal Anthropological institute held its centenary meeting. The work of the institute was outlined by Sir John Myres (who was knighted during 1943 for his services to scholarship), the place of anthropology in colonial development considered by Lord Hailey, and G. M. Morant, V. G. Childe, R. V. Sayce, and R. Firth discussed other aspects of the future development of the subject. The proceedings of the centenary meeting of the American Ethnological society, New York City, were published in the April-June issue of the *American Anthropologist,* with a bibliography of the society's publications. *The Journal of American Folklore,* appearing in a new format, included in the July number a comprehensive survey by W. D.

Hand of the organization and activities of North American folklore societies. As in 1942, only the Council of the American Anthropological association met; R. Redfield was named president for 1944.

The first number of the *American Journal of Physical Anthropology, New Series,* under the editorship of C. D. Stewart, published a group of studies on the anthropometry of Latin America. The changed policy of the new editor and his editorial board was reflected in an increased number of biometric papers. M. S. Goldstein's "Demographic and Bodily Changes in Descendants of Mexican Immigrants," in the *Publications* of the Institute of Latin American Studies, University of Texas, made available findings that confirm those of Boas and others on the plasticity of the human physical form, and W. A. Lessa, in his work "An Appraisal of Constitutional Types" (*Memoir 62,* American Anthropological association), presented a critical study of methods and findings in this field.

Understandably, little archaeological work was done outside the Americas. A report of the program of the Institute of Andean Research appeared in the second issue of *Acta Americana,* with a bibliography of its publications. An issue of *American Antiquity* was devoted to the results of excavations in Latin America. One theoretical paper in the same journal (Oct. 1943) by J. Bennett, "Recent Developments in the Functional Interpretation of Archaeological Data," made the point that undue stress had been laid on the material aspects of artefacts and indicated approaches toward analyzing the social behaviour of the peoples who used them. The Chicago Natural History museum, formerly the Field museum, Chicago, opened the first section of its Hall of New World Archaeology.

In the field of linguistics, there were to be noted the papers in *African Studies* dealing with Swahili, Lozi (a Barotseland *lingua franca* of Bantu base) and Thlaping, together with a report by C. M. Doke on the status of research into the native languages of South Africa. *Oceania* carried three instalments of T. G. H. Strehlow's "Aranda Grammar," as well as a number of other contributions to the study of native Australian tongues. In the U.S., two notable general papers and one monograph were inspired by the war: L. Bloomfield, *Outline Guide for the Practical Study of Foreign Languages,* B. Block and G. L. Trager, *Outline of Linguistic Analysis,* and R. A. Hall, *Melanesian Pidgin English* (all published by the Linguistic Society of America).

Contributions to the study of culture which appeared during the year included a paper on "The Future of Social Anthropology," by Lord Raglan, which engendered lively discussion by various members of the Royal Anthropological institute, according to abstracts published in *Man* (May-June 1943). L. A. White continued his studies in cultural evolution ("Energy and the Evolution of Culture," *American Anthropologist,* July-Sept. 1943), E. S. Goldfrank considered the problem of the relationship between historic change and social character (*ibid.,* Jan.-Mar. 1943), while in the field of social organization, M. Titiev's paper "The Influence of Common Residence on the Unilateral Classification of Kindred" (*ibid.,* Oct.-Dec. 1943) is to be remarked. The comprehensive study of the life of the Australian aborigines in the Ooldea region of western South Australia by R. and C. Berndt, which began in the 1941–42 volume of *Oceania,* was continued and, when complete, would materially extend our knowledge of native life on that continent. There were relatively few monographs, outside the standard series. Among the books of less restricted anthropological interest were *Alaska Diary* by the late A. Hrdlicka, *The Realm of the Rain-Queen, a Study of Lovedu Society* by E. J. and D. J. Krige, *Education and the Cultural Process,* by various authors (C. S. Johnson, editor), *The Irish Stone Age* by H. L. Movius, Jr. and *Keep Your Powder Dry* by M. Mead.

Memoir No. 61 of the American Anthropological association was issued as a memorial to Franz Boas. Essays covering the many aspects of his scientific activities and a definitive list of his publications are included to give a rounded picture of the man and his work. Obituary notices of Elsie Clews Parsons (*Journal of American Folklore,* Jan.-March; *American Anthropologist,* April-June) and of B. Malinowski (*Man,* Jan.-Feb.; *Oceania,* Sept. 1942; *American Anthropologist,* July-Sept.; *J. Am. Folklore,* July-Sept.), analyzing the influence of these figures in anthropological trends, constituted, with the Boas memoir, important additions to the literature on the history of anthropology.

War Activities.—Anthropologists were largely called upon to contribute their specialized knowledge to the war effort. The nature of the contacts they had established with native peoples the world over and the methods they had developed for understanding varied modes of life permitted them to give realistic aid to intelligence units, or to those carrying on economic and psychological warfare, and to advise concerning many types of postwar programs of rehabilitation.

One such contribution was the Intensive Language Training program, an outstanding educational achievement of the war effort, which was initiated and sponsored by the American Council of Learned Societies. The Army Area Training program, in most instances closely correlated with relevant language instruction, likewise drew heavily on the methods and information supplied by cultural anthropologists. The language-area method also figured largely in the training of civil affairs officers. The National Research council, through its division of anthropology and psychology, set up committees on oceanic and African anthropology, both of which were active in preparing memoranda and personnel lists, many of a restricted character.

The need to channel all these services, however, soon became apparent. The Ethnogeographic board was therefore established as a central clearing house under the joint sponsorship of the American Council of Learned Societies, the Social Science Research council, the National Research council and the Smithsonian institution and under the directorship of William D. Strong established headquarters in the Smithsonian institution. The manifold activities of the board and the large quantity of materials it made available to the services and civilian agencies amply demonstrated its value. Its staff aided importantly in bringing out the Smithsonian institution's *War Background Series,* and its *Survival on Land and Sea,* which was prepared at the request of the navy, was given wide distribution and was expected to be instrumental in saving many lives. (M. J. Hs.)

Antimony.

Because of the large reserve accumulated, the use of antimony was relieved of allocation requirements and restrictions as of Jan. 1, 1943, after the War Production board had reported on the status of production, stocks and demand in 1943 and 1944.

In the past considerable amounts of low-grade ores had been imported from South America in order to build up the reserves, but such imports were expected to be heavily reduced in 1944. While 19,500 tons of metal were received in 1943 from South American ores, this was to be reduced to 1,250 tons in 1944 by the elimination of low-grade ores. Imports from Mexico were reported at 13,200 tons in 1943; (est.) 12,000 tons in 1944.

The Office of Price Administration established ceiling prices for antimony at 14.5 cents per lb., f.o.b. Laredo, Texas, for

U.S. Production, Stocks and Demand of Antimony, 1943 and 1944

	1943 Short tons	1944 Short tons
Stocks (Government and private)	22,066	36,090
Imports	32,700	13,250
Domestic production	5,124	4,000
Secondary recovery	18,000	12,000
Supply	77,890	65,340
Demand for		
Domestic primary	23,500	24,000
Domestic secondary	18,000	12,000
Exports	300	500
Total	41,800	36,500
Reserve at December 31	36,090	28,840

99+% metal, and 15 cents for 99.8% metal (G. A. Ro.)

Anti-Saloon League of America. The Anti-Saloon League of America, organized in 1895, is a nonpartisan, interdenominational, federated temperance organization. Its 32nd national convention was held in Washington, D.C., on May 16–17, 1943.

Nationally, the efforts of the league were directed during 1943 toward the prevention of the waste of manpower and materials involved in the manufacture and sale of alcoholic beverages during the war. Liquor control was characterized during the year by two principal developments: (1) Self-regulation by the liquor industry, such as rationing of existing liquor stocks; (2) Administrative restrictions imposed by the federal government as a conservation measure in aid of war production. The order requiring whisky distilleries to convert to the production of industrial alcohol remained in force throughout the year.

Several bills proposing restrictions by law upon the liquor traffic were pending in the 78th congress, such as H.R. 2082, the Bryson bill for war prohibition; S. 860, by Senator W. Lee O'Daniel, for the protection of the armed forces; S. 569, by Senator Arthur Capper, to prohibit the transportation of liquor advertising through the mediums of interstate commerce; and H.R. 2749, by Rep. Sam M. Russell, for prohibition in military camps and in zones around war production plants. No action was taken upon any of these measures.

The legislatures of nearly all of the states met in 1943. Measures relating to the liquor trade were considered in most of them, but few substantial changes were made in state laws. Liquor control authorities in many jurisdictions imposed severe rationing restrictions as a war measure, and in some instances decreased hours of sale.

The league continued its efforts to extend no-license areas by local option. The results showed gains in the number of places voting no-license.

On Nov. 16, 1943, Senator Frederick Van Nuys, from the committee on the judiciary, reported a resolution authorizing an investigation of the alcoholic beverage industry for alleged violations of ceiling prices, black market operations, profiteering, and monopolistic practices, on which hearings have been held.

The national headquarters were in 1943 at 131 B st. S.E., Washington 3, D.C. (*See* also LIQUORS, ALCOHOLIC.)

Anti-Semitism. The policy of extermination of the Jews within all countries under the influence of national socialist Germany was continued in 1943 with increasing savagery. It was reported from reliable sources that by the end of 1943 all Jews living in Germany, Austria and Czechoslovakia had been either liquidated by assassination, starvation or concentration camps, or had been deported to Poland where an even more terrible fate awaited them. During 1943 the Jews of the Netherlands suffered a similar fate. Against the protests

GERMAN RAID on the ghetto in Warsaw. A bitter struggle between Warsaw Jews and nazi troops in April 1943 was reported to have resulted in the virtual extinction of the former

of the Dutch population, all Jews were deported to Poland. Their number was estimated at 180,000 persons. The official deportations from the Netherlands started in April 1943 and were carried through in three stages in the spring of 1943. In its official report of April 20, 1943 the Inter-Allied Information Committee on Occupied Countries in London estimated that at that time 2,000,000 Jews, men, women and children, had been annihilated by the Germans or under German influence and that 5,000,000 more were then in immediate danger of extermination. Sickening details of torture and massacre carried out by the Germans were given. Families were ruthlessly split up, all the goods and valuables in Jewish possession were appropriated by the Germans. Special extermination squads were trained for the liquidation of the Jews in Poland. These methods were applied wherever German influence spread.

During 1943 the situation of the Jews, which had been relatively still bearable in Vichy-controlled France and in fascist Italy, worsened rapidly when the Germans took over direct control of the country. In the formerly "non-occupied" zone of Vichy-France all the additional restrictive measures were introduced when the Germans occupied that part of France, and the policy of complete segregation and extermination was applied there as in other German occupied countries. The fall of fascism and of Mussolini's government in Italy in July 1943 brought with it the official abandonment of the racial legislation and the anti-Semitic measures introduced in Italy under German pressure in 1938. But when the Germans took over northern and central Italy in Sept. 1943, after the Italian government of Marshal Badoglio had concluded an armistice with the Allies, the situation of the Jews in Italy became much worse than under the fascist regime. In the southern part of Italy, occupied by Allied troops, anti-Semitic legislation was abolished, but in that part of Italy only an insignificant number of Jews live.

Denmark with its deeply ingrained democratic and humanitarian tradition maintained, even after the German occupation of April 1940, the complete equality of the Jews. But in 1943 the Germans, wishing to break the democratic spirit of the Danes, took over the administration of Denmark, and as a result began to introduce the German anti-Semitic measures there. Helped by the Danish population a large part of the 6,000 Danish Jews succeeded to escape into Sweden where they were received with exemplary hospitality by the Swedish government and people.

The systematic process of the liquidation of the Jews in Poland was interrupted by the heroic resistance which, in May 1943, the

Jews in the overcrowded ghetto of Warsaw put up when the Germans started the final liquidation of the ghetto. The Germans had to bring up artillery and tanks to suppress the rising. In the United States and in Great Britain many liberal and humanitarian circles and Jewish organizations demanded temporary measures to grant asylum to those Jews who could be saved from the German hell, in territories of the United Nations or in neutral countries until, after the victory of the United Nations and the restoration of civilized life and the rule of law in the German occupied countries, the Jews could return to their homelands and participate in their reconstruction.

In the countries liberated from fascist control by Allied advance, anti-Semitic legislature was everywhere abolished. In French North Africa General Henri Honoré Giraud cancelled on March 14 all anti-Semitic legislation introduced by Marshal Pétain's government since July 1940. While thus restoring the complete democratic equality of French Jews, General Giraud left the revocation of the Crémieux decree of 1870, which gave French citizenship to Algerian native Jews, in force. The French Committee of National Liberation restored the Crémieux decree of 1870 on Oct. 21, 1943. The official statement said: "The Committee, examining the situation of the Jews of Algeria, noted in view of existing texts—on the one hand, the abrogation of all acts discriminating against Jews, on the other hand, abrogation of the Crémieux decree effectively subordinated to the definition of conditions of application which were not issued—that the Crémieux decree is now in vigor." The number of Algerian Jews amounts to about 145,000. By this step the complete legal status of the Jews in liberated French territory was restored as it had been before the French capitulation in June 1940.

Anti-Semitic agitation in democratic countries like the United States and Great Britain was checked by the realization that all anti-Semitic propaganda played into the hands of the enemy. There was an increase of anti-Semitic hooliganism in Boston in the fall of 1943 which necessitated special measures on the part of the governor of the state. Anti-Semitic literature was generally coupled with seditious propaganda. But on the whole in the democratic countries anti-Semitism was everywhere on the decrease. It is characteristic that the new Argentine government under Ramirez, which came to power in June 1943 and which was sympathetic to fascism and hostile to the United States, condoned and even supported anti-Semitic propaganda, though the only open anti-Semitic official measure taken, the suppression of the Jewish press, was rescinded as a result of American protest. Anti-Tank Guns: *see* MUNITIONS OF WAR.

Antoine, André (1851–1943), French actor-manager, founder of the Théâtre Libre and the Théâtre Antoine in Paris, was born Jan. 31 in Limoges. A report of his death was announced from Carteret, Brittany, according to a Berne dispatch of Oct. 21. (See *Encyclopædia Britannica.*)

Antonescu, Ion (1882–), Rumanian soldier and statesman, was born in Transylvania June 2 and fought with the Rumanian armies during World War I, after which he was promoted to the rank of colonel. He later became military attaché of Rumania in London and Rome, chief of the army's general staff and war minister. He was named prime minister by King Carol Sept. 5, 1940, in the midst of the disorders that followed the partition of Rumania. Antonescu's first act was to demand the abdication of Carol. The prime minister then assumed dictatorial powers and on Sept. 14, 1940, formally promulgated a totalitarian rule. He signed a pact with Germany, Nov. 23. In Jan. 1941, Antonescu subdued Iron Guardist anti-Semitic riots, and tightened his grip on the government, with German backing. On June 22, 1941, the day that Germany invaded Russia, Rumania also attacked, with Antonescu assuming title of generalissimo and commander of Rumanian armies in Bessarabia. The campaigns of the next two and a half years were most costly. In March 1942, Antonescu ordered drastic measures to curb anti-fascist unrest. As losses at the front mounted and the armies retreated, morale in Rumania fell. Antonescu's troubles in 1943 included a threatened invasion of Transylvania by Hungary, demands for aid by Hitler and revolt at home. He was said to have admitted loss of 500,000 men, including losses at Stalingrad.

Anzelevitz, Benjamin: *see* BERNIE, BEN.

Apples. The commercial apple crop in the United States in 1943 was estimated by the U.S. department of agriculture as about 31% smaller than the 1942 crop. Production of apples in 1943 was placed at 88,086,000 bu. compared with 128,273,000 bu. in 1942. The crop was about 28% of the eight-year average 1934–41. The decline in production was noted in the far west and eastern districts. The size and quality of the fruit was also not up to the average. Notwithstanding the shortage of labour the 1943 apple crop was more completely

HAULING APPLES from an orchard in New York state. The 1943 U.S. harvest was below average

harvested and utilized in all parts of the country. Apple prices in 1943 were from two and a half to three times the prices of

U.S. Apple Production in Leading States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
Washington	23,184,000	27,339,000	Colorado	1,140,000	1,595,000
New York	12,250,000	18,997,000	Indiana	1,010,000	1,392,000

1942, and remained at the ceiling, bringing growers the largest returns in more than 20 years. The demand for fresh fruit was so great as to cause a shortage of small sized apples for processing into by-products. (J. C. Ms.)

Appleyard, Rollo (1867–1943), British engineer, physicist and inventor, was born Jan. 1. He was educated at Dulwich college, and later was attached to the staff of the Royal Engineering college, 1885–92. He joined the London *Times* in 1905 as technical adviser and writer. Appleyard served with the navy during World War I as adviser on aeronautical instruments in the Air Service. Later, he was appointed to the War Staff's convoy section and edited *Convoy Instructions*. He invented the conductometer for measuring electrical conductivity and various instruments including some in the aeronautical field. His research covered dielectrics, alloys, thermometry and surface tension. Appleyard also is credited with designing the core of a section of the Pacific cable. He died in London, March 1.

Aquariums. The aquarium in the Regents Park Zoological Garden, London, reopened on June 11, 1943, on a necessarily reduced scale, after having been closed for reasons of public safety, with the beginning of hostilities. No word was received of aquariums near active theatres of war, but undoubtedly such were closed, if not destroyed. During one of the German raids on England a bomb did actually hit the then closed London aquarium.

Aquariums in the United States retained a *status quo* for the year, there being no further closure of such public institutions, nor did any reopen during that period. All suffered from transportation and personnel difficulties and could do little more than attempt to hold their present status for the duration of the conflict. (C. M. BR.)

Aqueducts. The Colorado river aqueduct, constructed by the Metropolitan Water District of Southern California, served a vital war need, providing a dependable supply of municipal and industrial water to Los Angeles and 12 neighbouring coast cities where there are major war industries. The aqueduct taps the Colorado river at Parker dam. The diversion is made possible through the regulation of the river by this dam and another larger dam, Boulder, situated 150 miles upstream, both erected by the federal bureau of reclamation. Construction of the pipeline and its distribution system, totalling 392 mi. in length, was completed on Aug. 18, 1941, at a cost of $200,000,000. The main aqueduct is 241 mi. long, extending from Parker dam to Cajalco reservoir, 12 mi. south of Riverside, California. The capacity of the system is 1,000,000,000 gal. per day.

Two miles of the 13.1-mi. Continental Divide tunnel of the bureau of reclamation's Colorado-Big Thompson project (Colorado) remained to be drilled. The entire length was planned to be lined with concrete. When completed the tunnel was expected to divert surplus water from the headwaters of the Colorado river on the western slope of the Rocky mountains to lands on the northeastern slope in northeastern Colorado to supplement an inadequate supply serving 615,000 acres of productive land.

Construction of the 40-mi. Salt Lake City aqueduct, 9 miles of which had been completed, was interrupted in Dec. 1942 by a stop-construction order issued by the War Production board to divert critical materials to other war uses. Approval was given in Oct. 1943, to install an additional 13,200 ft. of the 69-in. reinforced concrete pipe. The aqueduct has a capacity of 150 second feet. When completed it was expected to bring a supplemental supply of municipal and industrial water to Salt Lake City, Utah, where military and industrial activities increased the population by 50%.

Water brought to the irrigated lands of the Imperial valley, California, through the bureau of reclamation's All-American canal—the nation's greatest irrigation ditch—made possible in 1942 the production of crops valued at $38,163,000. This total is only slightly less than the construction cost—$38,500,000. The 80-mi. long structure brings water from the Colorado river at Imperial dam, near the Mexican border. Eighty-six and one-half miles of the 130-mi. Coachella branch of the All-American canal was completed and the War Production board in Oct. 1943, gave approval for the construction of an additional 27 mi. Ultimately 1,000,000 acres was planned to be served by the two canals.

Industries and towns in the upper San Francisco bay region (California) are served industrial and municipal water through the Contra Costa canal of the Central valley project. Thirty-eight miles of the 46-mi. waterway was completed by 1943. Completion of the Madera canal of this bureau of reclamation project, to bring water impounded by Friant dam to productive land in the San Joaquin valley, was authorized by the War Production board. Eight miles of the 37-mi.-long artificial waterway were built in 1941 before work was halted by the war.

Because of the war, construction on the 6-mi. Duchesne tunnel of the bureau of reclamation's Provo river project in Utah was stopped. The tunnel, 2.7 mi. of which had been completed, was to divert water for irrigation purposes from the Duchesne river on the Colorado river watershed to the Provo river for storage in the Deer Creek reservoir. ARA: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Arabia. Total area (est.) 1,000,000 sq.mi. Total pop. (est. 1937) 9,300,000; Saudi Arabia 4,500,000; Yemen 3,500,000; Oman and Muscat 500,000; Kuwait 80,000; Trucial Sheikhs 80,000. Language: Arabic; religion: Mohammedan. Rulers: Saudi Arabia, King Abd-ul-Aziz ibn Sa'ud; Yemen, Imam Yahya ibn Muhammad ibn Hamid ad-din; Oman and Muscat, Sultan Sayyid Sa'id ibn Taimur; Kuwait, Sheikh Ahmad ibn Jabir as-Subah.

History.—There was no change in the international position of Saudi Arabia during 1943. King Abd-ul-Aziz ibn Sa'ud continued to be on friendly terms with the British government, and his relations with the U.S.A. were strengthened. Thus in April Alexander Kirk, the U.S. minister to Egypt and Saudi Arabia, visited the king in Riyadh; and in October two of the king's sons, the Emirs Feisal and Khalid, visited the United States at the invitation of President Roosevelt. During the year the American government

TWO SONS OF KING IBN SA'UD of Arabia—Prince Feisal (left) and Prince Khalid—toured the United States in the fall of 1943. They were greeted in Washington by Assistant Sec'y of State Adolf A. Berle, Jr. (left)

extended the application of the lend-lease act to Saudi Arabia. James S. Moose was made minister to Saudi Arabia in June.

The Saudi Arabian government was among the Arab governments to which the Egyptian prime minister, Nahas Pasha, sent invitations to take part in discussions on the question of Arab union. The king's views on the subject were expressed in a letter to Nahas Pasha; but, after a visit to Riyadh by a representative of Nahas Pasha in October, the king agreed to send a delegate to Cairo to discuss the matter further with the Egyptian prime minister.

Ibn Sa'ud's interest in Arab problems was also shown in an interview which he gave to a correspondent of the American periodical *Life* in May. He denied that the Jews had any right to Palestine. Their demands, he claimed, constituted an injustice to the Arabs and the Moslems in general and caused dissensions between the Moslems and their friends, the Allies. There were other countries more fertile and more suitable for Jewish settlement. The Arabs would safeguard the interests of the native Jewish population of Palestine, provided they committed no action that might lead to strife.

The government continued its efforts to improve the economic system. Agriculture was helped by subsidies, by the extension of the area under cultivation and by an increase in the settled population. The production of oil by American concessionary companies continued in spite of the lack of equipment.

In February the Imam of the Yemen interned the Germans and Italians in his territories. He too was invited by Nahas Pasha to take part in the discussions on Arab union; in reply he sent a letter asking for further details of Nahas Pasha's plans.

Finance.—Monetary unit, Indian rupee, and in Saudi Arabia the rial. Exchange rate in 1942: 1 rial=Rs. 1 (Indian)=U.S. cents 30.12.

Trade.—With India (1939–40): Oman and Muscat, imports Rs.24,55,362; exports Rs.35,71,387; other states of Arabia, imports Rs.9,89,030; exports Rs.73,18,701. With the United Kingdom (1938): Saudi Arabia and Yemen, imports £94,960; exports £28,871; Oman and Muscat, Trucial Sheikhs and Kuwait, imports £40,262; exports £18,354. Total trade of Oman and Muscat (1938–39): imports Rs.48,76,193; exports Rs.33,31,939; Kuwait (1937–38): imports £410,812; exports £174,006.

Archaeology.

Eastern Hemisphere.—As in the previous war years, the reports on archaeological discoveries in the year 1943 were brief and tardy. The following list cannot be assumed to be complete for 1943, and certain items of interest are mentioned which actually depend on excavations and explorations of several years ago. Information concerning the latter only came to hand in 1943. Planned excavations naturally were few. Moreover, reports from axis-occupied Europe were practically nonexistent.

There were two definite signs of planning for the future of archaeology, and a reconsideration of the role of archaeology in the postwar world—from the point of view of the archaeologist himself, and of his contribution to knowledge and human understanding. In August, the Institute of Archaeology of the University of London called a conference, which was attended by leading British archaeologists. The London conference considered the possible contributions which archaeology may make in the postwar world in Britain and overseas. The training of archaeologists, the means of permanent recording, and the place of the museum and of archaeological research in general education were also discussed. In July, a somewhat more specialized conference was convened in Jerusalem to consider the future of near eastern archaeology. The Jerusalem conference was somewhat more directly concerned with the legal status of an excavator and his finds in foreign states, but it also urged the establishment of international congresses, co-operation, planning and nomenclature. Preliminary discussions concerning the agenda of an American conference, to be called some time in the near future, were already under way.

Perhaps the outstanding archaeological events of the year 1943 were the publication of two different volumes, signed wholly or in part by Dr. Hallum L. Movius, Jr., of Harvard, which serve to distinguish him as one of the foremost American prehistorians. The first of these volumes, *Research on Early Man in Burma* (Trans. Am. Phil. Soc., n.s. vol. xxxii, pt. iii), Philadelphia: Am. Phil. Soc., 1943, is the work of Hellmut de Terra and Movius, with supplementary reports by E. H. Colbert and J. Bequaert. The second volume is Movius' *The Irish Stone Age* (Cambridge University press, 1942). Both volumes report for the first time work done previously to 1943, but their importance surpasses any available information on work accomplished within the last year. Word reached the Oriental institute of excavations carried on for the directorate of antiquities of the Iraq government by Seton Lloyd, which concerns the range of the earliest village horizons of northern Mesopotamia. This, also, is of extreme archaeological importance, but no details of the excavations were available in 1943. An important archaeological survey was carried on by Nelson Glueck in the Jordan valley. In addition, a remarkable chance find was made in the discovery of the tomb of the Emperor, Wang Chien, in China.

The Palaeolithic-Mesolithic Periods.—The Abbé Breuil (with collaborators) published a brief opinion on the crude pebble tool industries from the Atlantic coastal terraces of Portugal (*Proc. Prehist. Soc.*, viii). These shell-food collectors are said to have shown remarkably little industrial ingenuity from Abbevillian

times to the Mesolithic, and Breuil suggests calling these industries "Lusitanian" to distinguish them from the more normal artifacts found in the interior.

Flint artifacts described as similar to the "Chellean," "early Acheulean," and "Acheulean IV" of east Africa, are reported from the five-metre gravels above the flood plain of the valley near the joining of the Blue and White Nile. "Late Acheulean" and "Levalloisian" artifacts appear as surface finds. The context is important, indicating that in this part of the Nile valley (Anglo-Egyptian Sudan), the river had nearly reached its present-day erosion level at the time the flints were produced.

Farther south in Africa, the materials from the Mumbwa caves of Northern Rhodesia were reworked in the consideration of new excavations, by J. D. Clark (*Trans. Roy. Soc. S. Africa,* xxix, pt. iii). No lower Palaeolithic material is accounted for, and the sequence indicates Rhodesian Stillbay, Northern Rhodesian Wilton, and then Iron Age. The previously discovered "furnace with iron slag" of the middle levels is found to have been a grave, with the "slag" not really slag, but a cemented sand and silt deposit.

In *Proc. Prehist. Soc.*, viii, Prof. Dorothy Garrod reported on the Levalloiso-Mousterian and the upper Natufian of Shukba cave in Palestine.

The above-mentioned *Research on Early Man in Burma* by de Terra and Movius considers materials collected in the Irrawaddy basin and in the northern Shan highlands. De Terra demonstrates that the Pleistocene geology of Burma closely resembles that of northern India, which he had studied so competently. Both areas are characterized by a tilted and folded lower Pleistocene series containing the Villafranchian fauna; this is followed unconformably by five successive terraces of similar composition, in the middle and upper Pleistocene. The same general sequence is shown by Teilhard de Chardin's scheme for south China, and a close correspondence is suggested between the Irrawaddy and the Yangtze terrace systems. There are also some features of the less-well-known Pleistocene of Malaya and Java which suggest the same sequence. De Terra offers an expanded tentative scheme of correlation of the Pleistocene sequences of the lowland regions, surrounding the mountain ranges of Eurasia. It would be highly desirable to have de Terra's studies extended to the eastern Mediterranean basin.

With the geological framework set, Movius discusses the artifacts recovered from the Burmese terraces. There are, briefly, two main ranges of chopper tools called early and late Anyathian (after *ān-ya-thā*, colloquial Burmese for an upper Burman). The early Anyathian may be subdivided (mainly on stratigraphic grounds) into three parts, the late Anyathian into two parts. Early Anyathian *1* artifacts are found *in situ,* but heavily abraded, in the highest terrace (middle Pleistocene); late Anyathian *2* artifacts appear in the gravels of terrace *4;* terrace *5* contains Neolithic materials.

There are only minor typological differences between the early and late Anyathian scraper and chopper tools. The tools are made in either silicified tuff or fossil wood; the tuff has working properties which are little inferior to flint, and Movius insists that the rather crude chopper tools were purposely so produced and do not depend on limitations imposed by the material.

In his conclusions, Movius gave the most useful synthesis available so far on the newly recognized chopper tool complex of southeastern Asia. It seemed clear that this area—China (including Choukoutien), Burma, Java, Malaya and India—supported a Palaeolithic population which produced rather heavy stone tools of a distinct chopper type. The general consistency of this tool type in the Asiatic area (*i.e.,* the area south of the Amur river) is also emphasized by the absence of the two main tool preparation traditions of the lower Palaeolithic in Europe and Africa, the true hand axes (bifaces) and the flake tools. The areas of distribution of the Asiatic chopper tools and of the European bifaces and flakes evidently overlap in India, and perhaps in east and south Africa. Taken with de Terra and Paterson's *Studies on the Ice Age in India,* this volume opens up vast new vistas in the prehistory of the old world.

In *Man,* xliii, 17 (March–April 1943), Prof. V. Gordon Childe considered evidence newly arrived from the Scandinavian countries to the effect that the classic Danish shell-mound or Ertebølle materials can no longer be considered as purely Mesolithic. Recent Danish work on the strand lines shows evidence of different Atlantic transgressions, and a rechecking of the excavations at Brabrand Sø, with an analysis of its pollen content, shows it to belong to a late Atlantic transgression comparable in date to Montelius' Neolithic III. There seems to be nothing to prevent the idea that an elemental Ertebølle actually appeared at the time of the early Atlantic transgression (*i.e.,* in the full Mesolithic range of time). On the other hand, such elements of the assemblage as pottery, *einkorn* grain, and ox bones were probably later and may be assumed as due to contact with nearby Neolithic groups.

Movius' *The Irish Stone Age* reported on the excavation of six Stone Age sites—one in County Waterford and five in Northern Ireland. The first part of the book is an intensive re-examination of the late glacial and postglacial chronology of northern and northwestern Europe, with emphasis on Great Britain and Ireland. The geochronological setting is necessary, since the available Stone Age range of Irish material does not immediately conform to the "classic industries" of western Europe. The assemblages in question are called early and late Larnian (from a concentration of the finds along the coast at Larne). The earlier material is fixed in time by overlying beds of Late Boreal-Early Atlantic peat (at least *c.* 6000 B.C.); the late Larnian assemblage was still being produced when the Neolithic peoples began to appear about 2000 B.C. The early Larnian flint tools include blades, scrapers and picks; superficially tanged points, choppers and a few axes are added in the late assemblage. The producers of the Larnian materials seem to have been hunters, food collectors and fishermen, whom Movius believes to have reached Ireland from northwestern Europe before the Litorina submergence. They seem to have been descendants of the final Upper Palaeolithic peoples of northwestern Europe, and, although later arrivals in Ireland pushed them into the interior, their basic stock is present in the Irish people of today.

In *Man,* xliii, 2 (Jan.–Feb. 1943), Prof. Childe concluded his series of syntheses of Russian investigations, this article being concerned with the range of materials from the Mesolithic to the Iron Age, in the forest zone.

The Near East.—Under Zaki Y. Saad, some 735 First Dynasty graves were cleared at Helwan, near Cairo, Egypt. The materials contained in the graves are in part shown in the *Illustrated London News* (May 1, 1943); they consist of pottery and stone vessels, part of an ivory boat model, and various beads and pendants of semiprecious stones. It is important to note that "scarabs" are mentioned as having been used as pendants in the necklaces, and one such object appears in a photograph. The proper Egyptian scarab does not appear until the latter half of the First Intermediate period, and to describe the elongated bug-shaped object shown in the photograph as a "scarab" is misleading, in view of the First Dynasty context claimed by the excavator. The graves also contained curved ivory wands with animal heads (described as *"objets d'art"*) which are known from the reliefs to have been held by dancers, and probably

beaten against one another as cymbals.

As regards Mesopotamia, it is unfortunate that the details of Seton Lloyd's new excavations (*see* above) were not available. The Oriental institute added to its growing list of publications of the Iraq expedition the volume on *More Sculpture from the Diyala Region* by Prof. Henri Frankfort.

Nelson Glueck carried on an important archaeological survey for the American School of Oriental Research and the Smithsonian institution, on the eastern side of the Jordan valley (Trans-Jordan). These explorations revealed the ruins of a large number of ancient sites, with a range of dates (on the basis of the potsherds collected) from the Chalcolithic to Byzantine periods. The sites of Biblical times were always built on easily fortified and usually isolated hills, which dominated perennial streams and strategic roads—sites which might guard the fertile irrigated plains and streams from which the inhabitants gained their sustenance. By a careful consideration of the geography of the Biblical narratives and by the various ranges of dates indicated by the pottery he collected, Glueck has suggested a number of identifications of these sites with towns of Biblical times. The identifications include Jabesh-Gilead, Zarethan, Soccoth and Zaphon. The survey also traversed the great dolmen fields of Trans-Jordan, from Tell el-Hammām to the Dead sea. Glueck describes the ruins of a stone house which he suspects was built by the dolmen builders; he follows Prof. Albright in suggesting a Neolithic (*i.e.*, "Tahunian") date for the dolmens. In *Belleten,* vii, 26 (Türk Tarih Kumumu), there is a short report on the agora at Smyrna in Turkey, with plans, architectural photographs, and a sketch suggesting the original appearance of the basilica.

Some 30 tumuli were excavated on the island of Bahrein in the Persian gulf by P. B. Cornwell (*Asia,* April 1943, pp. 230 *ff*). Two types of tumuli are described, one of simple cairn-like rock mounds, and one composed of dirt and limestone chips which usually enclosed a tomb chamber or cist. The same types were noted in explorations in Saudi Arabia. One large Bahrein tomb contained the remains of beds, also pottery, bronzes, a circular ivory box fragment, ostrich shell fragments, and the skeletons of sheep. The human physical specimens recovered from the Bahrein tombs were mainly of adult males. An attempt is made to connect the Bahrein material to that of Mesopotamia, but this attempt is valid in only the most generalized sense.

In the *Geographical Journal,* ci, iii (1943), Major R. A. B. Hamilton describes different types of ruins he has observed in the Western Aden Protectorate of Arabia.

Europe.—Very little information is available on recent archaeological activities within Europe, although the *American Journal of Archaeology,* xlvii, 2 (April-June 1943) gives abstracts of notices contained in a mimeographed Swiss publication (*The New Pallas,* vi, 1942) which reached its editors. A number of the items noticed seem to refer to chance finds, although others (such as, that the Germans are undertaking research on the prehistoric cemeteries at Carnac, in Brittany) seem to imply planned archaeological operations. None of the notices seems particularly startling in an archaeological sense.

Two *Annuals* of the British School at Athens (vols. xxxviii and xxxix) appeared belatedly during 1943. The work of the late John Pendlebury in the plain of Lasithi, in east central Crete, and that of Miss Benton in a cave-sanctuary on Polis bay, Ithaca, were the only reports of excavations which the volumes contained. Miss Benton's work strengthens the case for the British school's belief that modern Ithaca is actually the Ithaca of Odysseus (the Germans believe otherwise).

In England, a fine group of ornaments was discovered in the graves of prosperous Anglo-Saxon peasants at Nassington near Peterborough. The graves date to the 6th and 7th centuries, A.D., and the contents show evidence that the people were pagans and probably worshippers of Odin. Besides brooches, of which some circular examples bore swastikas, there were spear heads, shield bosses, needles, and beads of amber and glass, as well as incised and impressed decorated black burnished pottery. Most of these materials came from the graves of women.

DIGGING IN AN INDIAN CAVE In Bear Mountain-Harriman State [illegible] discovered by a Girl Scout in Aug. 1943. The material recovered included important remains dating back to the 12th century

An early Iron Age fort on an island in Loch Craignish, Argyll, Scotland, was investigated, as well as a hut circle inside a large stone-walled enclosure. A round-chambered cairn of early Bronze Age date, found at the north end of the lake, was also studied.

Africa.—In *Man,* xliii, 34 (May-June 1943), J. Joire gives an inventory of finds taken from 11 burial mounds on the Senegalese coast of Africa, some 122 mi. northeast of Dakar. The position of the bodies indicates a pre-Islamic date, and the excavator judges that the people may have been Serers. The finds consisted mainly of jewellery and weapons, and included one fine gold pectoral. The pectoral and some of the jewellery appear, in the opinion of the excavator, to be Mediterranean types, and trade is postulated as the means for their having reached this district.

Asia.—Workmen digging an air-raid shelter in Chengtu, Szechwan province, China, came upon the brick and stone tomb of Wang Chien, distinguished official and self-appointed emperor of China in the 10th century, A.D. (*A.J.A.*, xlvii, 3, p. 265). At the back of the tomb chamber was a throne on which stood a statue (presumably of the dead man); before this was a dragon-handled coffin, and cases which contained two sets of jade books. The text in these is a commentary on the reign of Wang Chien. The coffin and its contents had not been fully investigated.

J. B.)

Western Hemisphere.—All professional archaeological explorations in the western hemisphere were terminated for the duration of World War II.

Archery. The archery events of nationwide significance in 1943 were the various mail matches conducted by the National Archery association (N.A.A.), the annual championship tournament having been cancelled on account of the war. These mail matches included the 16th annual series of indoor matches of the Olympic Bowman league in February, the 14th annual Woman's Intercollegiate Archery tournament and a nationwide Clout shoot in May, a nationwide Target shoot in August and a nationwide Flight shoot in October.

In the indoor matches, first place in the men's division went to the Madison Archery club, Madison, Wis., and in the women's division, to a team from University of Connecticut, Storrs, Conn.

Although most colleges were operating on a revised and speeded-up schedule because of the war, there were 82 teams (8 archers to a team) representing 56 colleges taking part in the Intercollegiate event. This was won by Team 1 from University of Connecticut.

Nearly 400 archers competed in the Clout shoot, the men shooting 36 arrows at 180 yds. and the women and juniors shooting 36 arrows at 120 yds. A. L. Harrison, Altadena, Calif., won in the men's division (score 36–276). Mrs. H. A. Biltzenburger, Los Angeles, Calif., won in the women's division (score 36–314) and John Mahoney of San Diego, Calif., won in the junior division (score 36–290).

The nationwide Target shoot, which brought out an entry list of nearly 900, was won by C. J. Weese, Newark, N. J., in the men's division, Mrs. S. Robert Leaman, Bird-in-Hand, Pa., in the women's division, John Mahoney, San Diego, Calif., in the boys' division and Marilyn Reinecke, Chicago, Ill., in the girls' division. Mrs. Leaman turned in a record-breaking score of 72–604 in the Columbia Round.

The regular style event of the nationwide Flight shoot was won by E. Bud Pierson of Cincinnati, Ohio, with a shot of 522 yds. 5½ in., which betters the previous N.A.A. record by over 16 yds. The free style event was won by Mike Humbert of Springboro, Ohio, with a shot of 566 yds.

The National Field Archers association conducted a series of field archery events by mail. (L. C. S.)

Architecture. By 1943 practically all building of any consequence to the development of architecture had been arrested by the war. The controversies between modernism and traditionalism, the rise of national styles, the growth of regional characteristics were blotted out by more urgent problems confronting the peoples of the earth in their strife for freedom and existence.

Planning for the postwar period began in England and America. Building was considered an important factor in the absorption of manpower released by demobilization and termination of war production. The devastation caused by aerial bombing demanded reconstruction—the better life promised the people after the war required replanning of towns and regions. War-expanded industries began to concern themselves with postwar uses for their materials and production facilities. Out of these conditions arose new opportunities for architects, and architecture itself took on a new concept; it became a social function for the benefit of the community. These changes found expression in the publication of plans for towns and regions, in official reports, in literature, propaganda pamphlets, advertisements and in exhibitions.

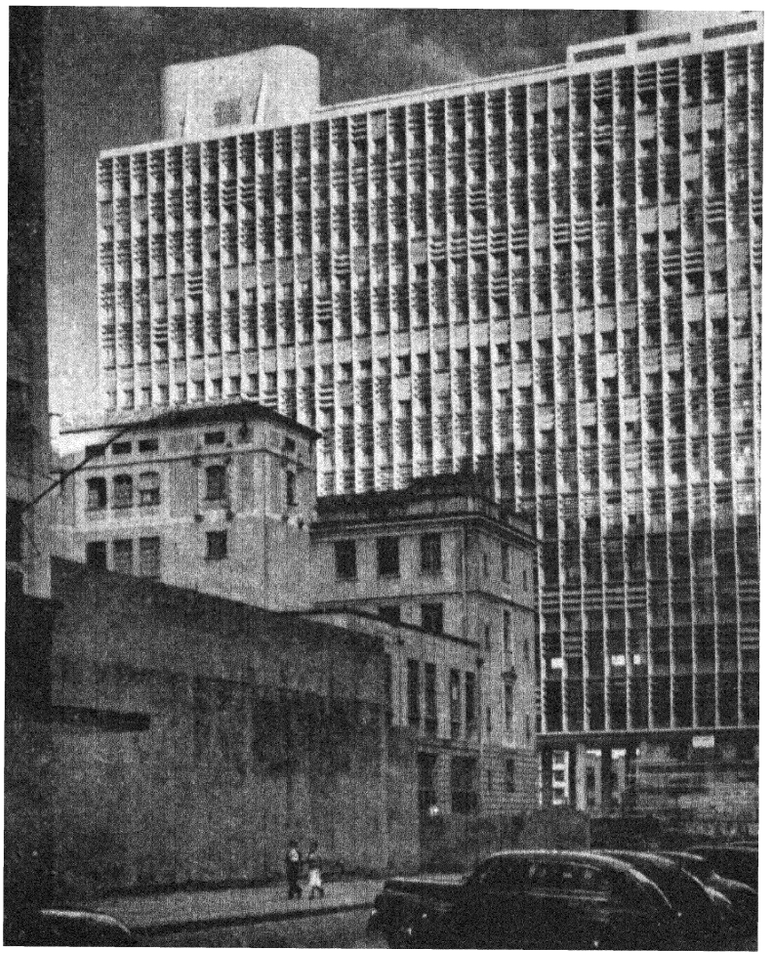
In the practice of architecture a closer co-operation between designers and technicians was demanded. The increasing complexity of building operations coupled with the desire for greater efficiency and economy gave advantages to the larger organizations in which the talents of architects, engineers, cost estimators, and construction managers were combined. A large volume of planning and design was also carried out by public bureaus and the design offices or research laboratories of industries.

Planning and Design.—The plans for postwar building were aimed at social betterment. Architects and town planners directed their efforts toward the elimination of squalor, the avoidance of crowding and congestion in centres of population, the opening of built-up areas by parks and playgrounds, the infiltration of sunshine and healthy surroundings into the urban districts and through larger windows even into the buildings themselves. Where aerial warfare had brought destruction, reconstruction was combined with social improvement and modernization of the pattern of the communities. Here as well as in countries untouched by devastation, it was realized that the older towns and cities were ripe for reconstruction and that this work provided a large field of employment for the postwar period.

In the design of postwar communities and buildings a greater intermingling of society under more stringent economic conditions was anticipated. Government and municipality, it was thought, would have to provide more public facilities for the education, welfare, and recreation of the people. Housing, schools, nurseries, health clinics, hospitals and neighbourhood recreational centres were therefore the buildings to which emphasis was given.

The conflict between modern and traditional architecture remained undecided. Certain changes had, however, established themselves. The thinner walls and larger windows resulting from modern building technique produced a less massive appearance, the interiors were more open and allowed for greater flexibility in use, meaningless ornamental decoration was absent.

In British writings, attention was called to the charm and fine qualities of the traditional architecture of the past, the beauty of the landscape and its harmony with the mellow quali-



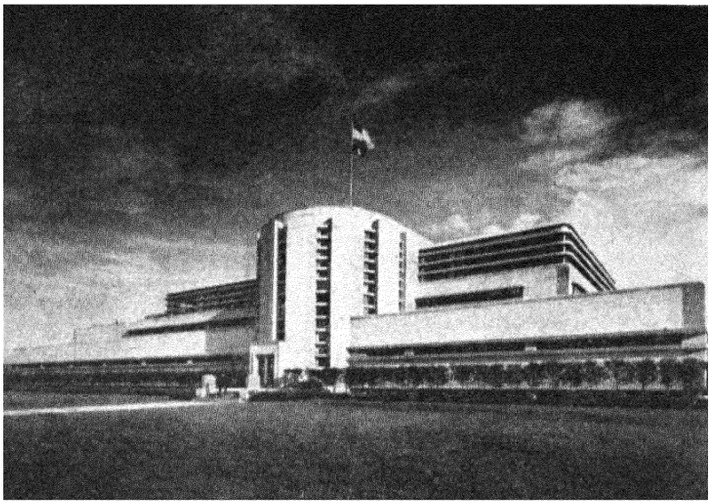
HOTEL STATLER, Washington, D.C. Holabird & Root, architects; A. R. Clas, assistant architect

ties of the old buildings. Simultaneously, and often by the same authors, it was considered probable that the modern movement through which design was passing during the interwar period would be continued after the war with increased tempo. In America it was predicted that the revolutionary changes in architecture which for so long had been only an intellectual ideal would come into existence as a technological necessity. The American Public Health association, through its committee on the hygiene of housing, had analyzed building requirements in the light of man's psychological and physiological needs and isolated the considerations that entered into the design of buildings for human needs. Scientific research was applied to the development of new building materials, construction methods and the design of building equipment. For example, the Pierce Foundation in New York carried out research and technical work "to the end that the general hygiene and comfort of human beings and their habitations may be advanced." Problems were here analyzed on the basis of human as well as economic requirements. Revere Copper and Brass, Inc., invited a group of well-known U.S. architects and designers to present in pamphlet form their conception of the buildings of the future.

Materials and Methods.—Three related forces presaged the coming of a revolutionary era in house technology: First, prefabrication and mass production of houses or components thereof; second, an immense progress in building technique as exemplified by modern construction, heating and air-conditioning, soundproofing, illumination and automatic control; third, the development of new materials, primarily plastics, plywood and light noncorroding metals. The war had given to prefabrication a fair volume of production in the demand for soldiers' huts and war workers' housing; in both cases the use was temporary and the living standards were consequently kept at a minimum. For postwar demands, standards were to be raised while costs were to be kept down. Multiple use of standardized sections, interchangeability of components of buildings similar to that of parts of the automobile, flexible and efficient planning, and reduction in field labour were the measures proposed for the accomplishment of these aims. An effort was made to arrive at a uniform basis or module to building dimensions. The function of every part of a residence was restudied in the light of social, economic and technological changes. Imaginative proposals stirred public interest. For example, it was suggested that the function of the kitchen be taken over by built-in equipment within the living or dining space; the tight shop-like kitchen which was the ideal of the prewar period was to disappear in favour of a more spacious room suitable for dining, living or children's play area. Sink, refrigerator and stove were all being considered for radical new design. Bathrooms were to be mass produced as one piece units composed of inter-connected fixtures completely piped and finished.

Building technique continued in its progress of supplying with ever increasing precision man's comfort within buildings. Interest continued to be focused on radiant heating (the warming of floors, walls or ceilings) and air-conditioning as a means to winter and summer comfort. Ultra-violet ray lamps were sometimes installed to kill germs. Eye fatigue was scientifically combatted in the design of illumination; the trend to increase the intensity of artificial lighting and to create brightness continued. Acoustic products and acoustic treatments were developed to prevent sound penetration between rooms and to provide for local absorption.

The demand for an increased speed of construction brought on by World War II combined with the high cost and relative inefficiency of labour at the building site had caused a movement away from natural materials toward the synthetic products.



MINISTRY OF EDUCATION AND HEALTH, Rio de Janeiro, Brazil. Lucio Costa, Oscar Niemeyer, Afonso Reidy, Carlos Leão, Jorge Moreira and Ernani Vasconcelos, architects; Le Corbusier, consultant

Increasingly stone and brick were substituted by cement products, plaster by wall boards, decorative clay tile by a variety of sheet materials, etc. Prominent among the new materials were plywood, plastics and light noncorroding metals for which the aeroplane demands of the war had created enlarged production facilities. New architectural uses for plastics products were investigated; pliable sheeting was developed for purposes of insulation and decorative covering; semirigid or rigid sheeting for wall boards and tiles; extruded products for mouldings, edgings, handrails, sunblinds, etc.; and finished moulded articles for structural functions, built-in fixtures and fittings, hardware, etc.

Examples of 1943 Architecture.—In the *United States*, the stringent control over materials enforced by the War Production board allowed only the building of essential war plants, housing for war workers, construction for military needs and the erection of buildings absolutely necessary to the safety and welfare of the public.

The housing for workers at the Ford bomber plant at Willow Run, Mich., was accomplished by the use of diverse types of structures: trailers, prefabricated single and multiple family houses and dormitories. Here as elsewhere the need for community centres to provide the eating, shopping, recreational and administrative facilities for the population was realized. Schools and nurseries for the children of war workers and infirmaries were also built. The firm of Eliel and Eero Saarinen and Robert F. Swanson was prominent among the architects for Willow Run.

The welfare building at the naval training station at Great Lakes, Ill., Skidmore, Owings and Merrill, architects, showed an ingenious use of laminated wood beams for the creation of long spans. Simplicity combined with unusual size gave impressive qualities to another naval training station on the east coast of

RESEARCH AND MANUFACTURING LABORATORIES of G. D. Searle & Co., Skokie, Ill. Herbert Banse, architect

the United States, Eggers and Higgins, architects.

The Statler hotel in Washington, Holabird and Root, A. R. Clas, associated architects, showed in the treatment of the guest rooms and public spaces the current trend of development in hotel design. The public lobby was broken up into a series of intimate spaces and segregated into the functions of lounging, the transaction of hotel business, and circulation. The guest rooms were furnished in the character of living rooms.

The house of John B. Nesbitt at Brentwood, Calif., Richard Neutra, architect, was indicative of a trend of departure from the severe character of the early functional style of architecture. Here as well as in the Weston Havens house at Berkeley, Calif., Harwell H. Harris, architect, a certain artistic freedom akin to poetry was reintroduced into modern architecture to create a play of form and of light and shade, and to add life to unadorned surfaces by the introduction of growing plants.

England's architectural activity was primarily devoted to plans for the rebuilding of Britain. The County of London plan prepared by J. H. Forshaw and P. Abercrombie at the request of Lord Reith, minister of works, proposed a 50-year program aimed at the repair of war damage combined with improvements to obsolescence, bad and unsuitable housing, inchoate communities, uncorrelated road systems, industrial congestion, a low level of urban design, inequality in the distribution of open spaces and increasing congestion. With an open mind to coming changes in architectural styles it advocated a liberal control of street architecture for harmony in aesthetic effect. The plan for the reconstruction of Coventry also aimed to create order and design out of disorder and destruction.

Housing, both temporary and permanent, and the few public buildings which were completed in wartime illustrate the development of British architecture. The estates for workers in the north of England designed by Arthur W. Kenyon combined the spirit of the modern age with the dignity of British brick architecture of the Georgian period. A temporary quality of design which war necessity gave to architecture was shown in a hostel for British war workers, F. R. S. Yorke, architect. The architecture of public buildings was exemplified in the Friern Barnet municipal offices in north London, Sir John Brown and A. E. Henson, architects. Here classic monumentality was expressed in motives somewhat influenced by Swedish architecture.

The architecture of *South America,* especially Brazil, came into prominence in the United States through an exhibition first held at the Museum of Modern Art in New York and later at the museums of other important cities. Lectureships and scholarships in architecture were exchanged between the countries of the Americas. (*See* also BUILDING AND CONSTRUCTION INDUSTRY.)

Archives, National.

The National Archives was established by an act of Congress approved June 19, 1934. Its primary objective is to make the experience of the American government and the American people as it is embodied in noncurrent records of the federal government available to guide and assist the government and the people in planning and conducting their activities. This is accomplished by selecting, assembling, preserving, organizing and making available for use the noncurrent records of the United States government that have permanent value.

There were on July 30, 1943, about 542,000 cu.ft. of records in the custody of the archivist of the United States. These included, in addition to the bulk of the older records, nearly all the records of emergency agencies of World War I, which have been extensively used in the planning and conduct of the present war. A 680 page *Handbook of Federal World War Agencies and their Records* was published in 1943.

A special function of The National Archives is the daily publication of the *Federal Register,* which contains all current administrative orders, rules and regulations issued by federal agencies that have general applicability and legal effect, including many documents on priorities, the selective service, export control and other phases of the war effort.

The Franklin D. Roosevelt Library at Hyde Park, which was dedicated in 1941, is administered by the archivist of the United States. The museum portions of the building are open to the public and the library is assembling and arranging the papers of the president and his associates. (S. J. BU.)

Areas and Populations of the Countries of the World.

The table that follows gives the area, population, and population per square mile for the various countries of the world. For many countries it was difficult under conditions of 1943 to secure population data which were entirely satisfactory. The latest available figures relate to different dates in different countries; and in some cases different dates connote different areas. The table gives figures for practically the entire world, however, with a minimum of overlap or similar complication and with a sufficient degree of accuracy to serve as a source of general information with respect to the relative importance of the several countries.

Name of State	*Area* (in Square Miles)	*Population* (000's omitted)	*Population per Square Mile*
Afghanistan	250,965	7,000	27·9
Albania	10,811	1,106	102·3

Argentina. A republic on the southeastern coast of South America, second largest state on the continent. Area: 1,079,965 sq.mi. The religion is Roman Catholic, the language, Spanish.

An official estimate of the population as of Dec. 31, 1943, was 13,709,238 persons (1941: 13,517,135). Argentine-born persons made up 76.9% of the total population (1940 est.), foreign-born (mainly Europeans) 19.9%, and mixed-bloods 3.2%. The basic stock is Spanish, with immigrants since 1860 estimated as 42% Italian, 33% Spanish, 8% Russian and Polish, 4% German and Austrian. The capital city is Buenos Aires (pop. est. 2,557,586 on March 31, 1943). Other major cities (with est. pop.) are Rosario (540,000); Avellaneda (a Buenos Aires suburb) (386,000); La Plata (248,000); Córdoba (273,852); Santa Fé (150,000); Tucumán (149,214); Bahía Blanca (114,148); Paraná (80,000). More than 50% of the population is classed as urban.

History.—In spite of powerful pressure from the United Nations, Argentina refused to sever diplomatic relations with the axis during 1943. At times in the year, notably shortly before President Ramón Castillo was displaced by a revolution (June 3–4), and in the first few days of the new administration then established, rumours indicated that a break might be impending, but control of foreign affairs remained in the hands of Argentineans who were determined to pursue an isolationist policy. In late 1942 a charge by the United States that active espionage was being carried on in Argentina had resulted in an investigation, as well as in some temporary restrictions on axis communications, and charges of espionage faced the German naval and air attaché, Capt. Otto Niebuhr, as a result. When he claimed diplomatic immunity, his recall was requested on Jan. 18, 1943. In the same period there was a sharp exchange of notes between the British and Argentine governments over the former's criticism

PRESIDENT PEDRO RAMÍREZ of Argentina (right) reviewing troops after his military coup d'état of June 4, 1943, which overthrew the regime of Pres. Ramón S. Castillo

of Argentine isolation. Argentina was pointedly ignored by Vice-President Wallace of the United States while on a South American visit in April, nor was it invited to be present at the United Nations Food conference held in the United States in May.

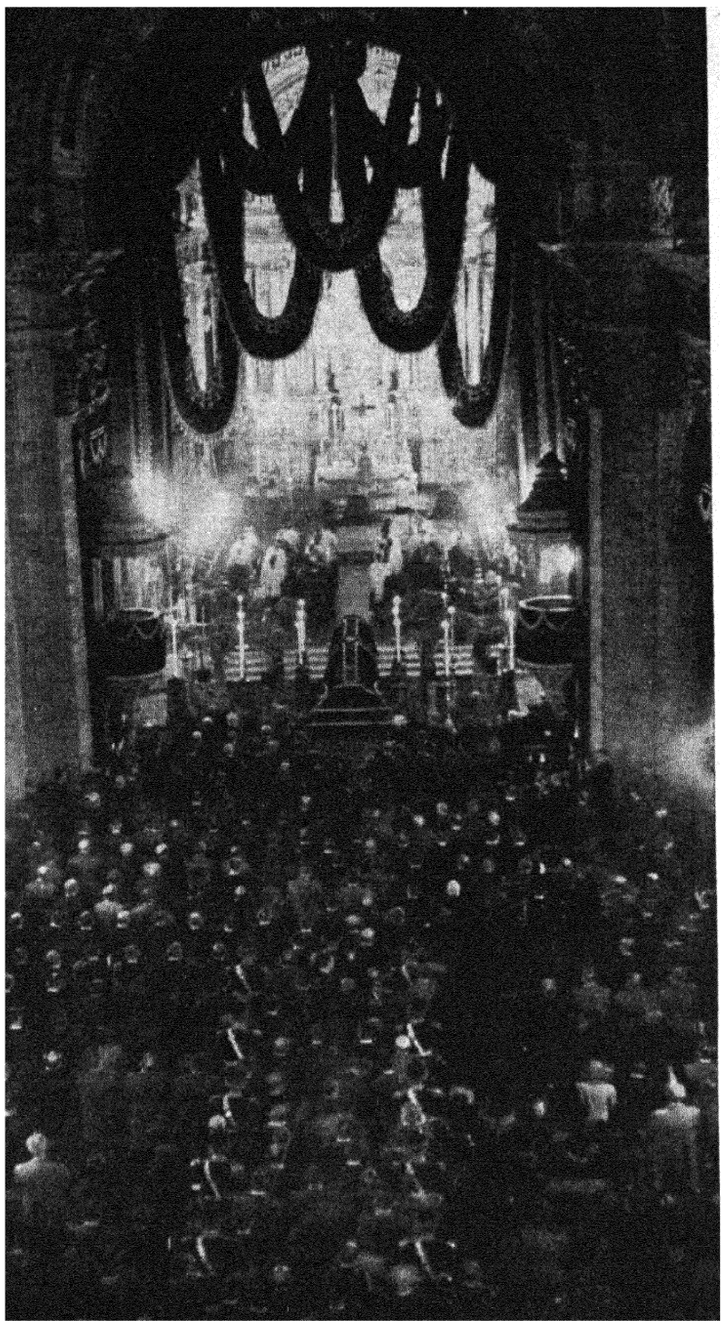
In internal politics the federal government retained emergency powers under the state of siege indefinitely extended Dec. 14, 1942. Much attention was focused upon political alignments in view of the presidential election due in 1945. Chief opponent of administration policy was former president Augustín P. Justo; his sudden death Jan. 10 removed one of the most powerful opponents of isolation. By June, President Castillo had broken Argentine precedent by coming out openly in favour of Robustiano Patrón Costas, with the administration coalition (the National Democrat and Radical Anti-Personalist parties) falling in line with the president. The plans and policies of the administration were aimed particularly at gaining the support of moderates. On the other hand, liberal Argentine parties found difficulty in settling former rivalries so that they could organize an effective opposition campaign.

On June 3–4 a comparatively bloodless revolution, headed by General Arturo Rawson and General Pedro P. Ramírez, deposed President Castillo and established a provisional administration (on June 18 it was officially decreed permanent). For two days the presidential office was held by General Rawson; he then resigned and was replaced by Ramírez.

Allied observers at first hoped that the new government would break with the axis, but cabinet and other appointments, as well as a vigorously nationalistic policy, soon made it apparent that the new government was even more conservative than that which it had displaced. Many of its leaders, including President Ramírez himself, had been associated with Argentine fascist groups. A rigorous proscription of pro-Allied newspapers followed a wave of criticism of the government's policy; in September alone more than 70 papers were suspended for varying periods of time, and some editors were jailed. When a federal interventor (Bruno Genta) discharged many liberal members of the staff of the great Litoral university of Entre Ríos, a serious student riot took place. In the last two months of 1943 there were additional disturbances among the students of other universities. The government suspended many pro-Allied organizations (including the *Junta Feminina de la Victoria,* a women's aid group not normally concerned with politics) on the charge that they were communist. Similar attempts against labour unions resulted in extensive strikes, with the government forced to modify its position in some cases. One of the most serious strikes started among the meat-packing employees of Avellaneda plants, in September, and lasted until Oct. 4, with a number of persons killed or injured during demonstrations. Late in November a general strike started in Mar del Plata over a new six-peso bicycle tax, and when police tried to punish strikers the action spread until some 30,000 workers had stopped work. The strike was not ended until Dec. 15, by which time arrested labour leaders had been released and the bicycle tax reduced to 50 centavos.

In the first week in September Foreign Minister Segundo Storni made an effort to secure lend-lease aid to be used to buy military supplies, but in response to the request the United States secretary of state, Cordell Hull, refused on the basis that Argentina was not co-operating with other American nations in maintaining hemisphere security. The interchange resulted in the resignation of Admiral Storni, but no change in general policy took place. Meanwhile, in the same month, General Rawson delayed in taking the post of ambassador to Brazil, to which he had been appointed, and instead toured the country making addresses in favour of a break with the axis powers. The administration finally had to order him to Rio de Janeiro, refusing to accept his tendered resignation.

Internal policies of the Ramírez administration included a number of measures designed to secure popular support: abolition of the official wine and grain boards, elimination of the hated Buenos Aires transportation monopoly, cuts in telephone, light and power rates, establishment of a national rental reduction measure, a reduction in the civil service for purposes of economy, an increase in pay for government employees, an increase in the minimum wage for farm labour, and an increase in farm loans to the amount of 20,000,000 pesos.



The most important international agreement made by Argentina during 1943 was the contract signed with Great Britain on Aug. 23 by which the entire exportable meat surplus of Argentina was put under contract for a period of two years from Oct. 1, 1942. The purchase was made by Great Britain for the United Nations. In November the same two nations entered into a price-fixing agreement on quebracho (tanbark). Other commercial treaties were signed with Chile and with Ecuador.

Argentina's favourable trade balance for the first nine months of 1943 was estimated at $73,500,000. In mid-September it was announced that £33,000,000 of the nation's £46,000,000 London-held bonds would be repatriated. In May the British-owned province of Buenos Aires waterworks was purchased by the government for 12,000,000 pesos, and in December the U.S.-owned street railway system of the city of Tucumán was purchased by the municipality. The greatest war-caused shortages felt in Argentina were in regard to fuel oils, with linseed oil and corn used in large quantities as a substitute, and in regard to rubber. Foodstuffs were generally plentiful.

Education.—Argentina provides free and compulsory education for its citizens. Elementary schools in 1941 numbered 14,059; secondary schools, 445 (in 1940). Enrolment in elementary schools was 2,005,462; in the secondary division, 75,903. Of the latter 42,000 students attended the 197 normal schools of the nation. There were in 1939 1,167 private schools with an enrolment of 139,917.

Finance.—The monetary unit is the peso, free value in 1943 25 cents U.S. (official type A exchange peso: 26.8 cents U.S.; type B exchange peso: 23.6 cents U.S.). The budget for 1943 placed expenditures at 1,204,000,000 pesos; in July it was estimated officially that the deficit for the year would amount to between 360,000,000 and 400,000,000 pesos (in 1942 expenditures had been 1,250,800,000 pesos; receipts: 1,001,700,000 pesos). Revenue for the first half of 1943 was 489,582,000 pesos; the largest sources of income were the income tax (133,793,000 pesos), excise duties (132,602,000 pesos) and customs (62,857,000 pesos). The 1944 administrative budget (prepared before the revolution) estimated ordinary expenditures at 1,301,100,000 pesos; revenue at 1,107,300,000 pesos. The public debt as of Dec. 31, 1943, was 6,243,300,000 pesos (1941: 5,783,900,000 pesos). Gold and foreign exchange reserves in the Central bank on June 30, 1943, amounted to 2,580,200,000 pesos; notes in circulation were 1,691,960,000 pesos in value.

Trade and Communication.—In 1942 Argentina's trade totalled in value 3,063,319,700 pesos (exports: 1,788,958,100 pesos; imports: 1,274,361,600 pesos). Figures released for Jan. 1–June 30, 1943, valued the total foreign trade for the period at 1,323,764,300 pesos (1942: 1,584,115,000 pesos). Exports were 880,135,500 pesos in value, imports amounted to 443,628,800 pesos. Principal imports were: fuels and lubricants (1,160,500 short tons); stone, earth, glass and pottery (839,700 short tons); wood and manufactures (278,900 short tons); chemicals and drugs (104,170 short tons); iron and manufactures (106,800 short tons); foodstuffs (91,500 short tons); textiles (70,100 short tons); paper products (75,950 short tons). Leading exports for the first half-

FUNERAL MASS at the cathedral of Buenos Aires June 12, 1943 for the 82 persons killed in Gen. Pedro Ramírez' coup d'état of June 4

year were (in short tons): meat (250,000); wheat (894,700); linseed (169,300); meat sundries (80,250); hides and skins (79,700); wool (60,950); quebracho products (68,100); maize (98,200); vegetable oils (56,550); minerals (51,250); oats (42,770).

In 1943 there were in operation 7,873 mi. of state-owned and 17,954 mi. of privately-owned railways. The national highway system approximated 36,600 mi., of which 11,224 mi. was listed as improved. Air transportation by Pan American gave service to all parts of America. The state merchant marine amounted to 38 vessels (approximately 200,000 gross tons).

Agriculture.—The chief resources of Argentina are agricultural and pastoral, with about 11% and 45% respectively of the total area of the country devoted to these activities in 1941.

Cereal production for the crop year 1942–43 was officially estimated as follows (in short tons): wheat (7,054,700); maize (2,138,500); oats (639,300); barley (358,800); rye (165,300); rice (111,300). Linseed production for 1942–43 was officially estimated at 1,681,000 short tons. Production (1941) of other oil-bearing seeds was (in short tons): rapeseed 53,391; peanuts (shelled) 55,611; cottonseed 96,566; sunflower seed 442,803. Sugar production (1942) was 398,812 short tons; tobacco (official estimate 1942–43 year) 16,443 short tons.

Manufacturing.—Manufacturing became increasingly important in Argentina after 1936; the total value of industrial production (value added to that of raw materials) was estimated (1941) at approximately 3,400,000,000 pesos. Chief items of production were foodstuffs, textiles, forest products, paper products and chemicals. The number of industrial establishments in 1940 was estimated at 57,200; staff employed at 765,000 persons.

Mineral Production.—A total of 12,714,969 short tons of rocks and minerals was extracted in 1941, total value estimated at 183,051,000 pesos (increases of 4.3% and 7.4%, respectively, over 1940 figures). Metalliferous concentrates amounted to 122,033 short tons (value: 27,206,000 pesos); non-metalliferous (fuel, rock salts, etc.) totalled 12,592,935 short tons (value: 155,845,000 pesos); of this petroleum amounted to 3,857,782 short tons. (*See* also FASCISM.) (D. RD.)

Arizona.

The "Apache state" lies in the southwestern part of the United States of America. It borders Mexico on the south; the Colorado river forms most of the western boundary. Area, 113,909 sq.mi. including 329 sq.mi. of water. Pop. (1940) 499,261, 65.2% rural and 34.8% urban. Native and foreign-born whites (including Mexicans) numbered 389,955 and 36,837 respectively; Negroes 14,993; other races (mostly Indians), 57,476. Estimated population of the state March 1, 1943 was 578,756. The capital is Phoenix with a population (1940) of 65,414; chief cities: Tucson (36,818); Douglas (8,623); Mesa (7,224); Globe (6,141); Prescott (6,018); Bisbee (5,853); Yuma (5,325) and Flagstaff (5,080).

History.—The state officials in 1943 were: chief justice, Archibald G. McAlister; governor, Sidney P. Osborn; secretary of state, Dan E. Garvey; attorney-general, Joe Conway; treasurer, James D. Brush. The state legislature of 1943 passed 96 acts. An act was passed authorizing the signing of a contract between the United States of America and Arizona providing for "delivery for use in this state of all such waters of the Colorado river as are available for use in this state." On Dec. 18, 1943 Utah withdrew objections to the contract for Arizona's participation in the Colorado river compact. On Dec. 21, California requested an oral hearing before approving.

Education.—According to the report of 1941–42 the net enrolment and the number of teachers in the public schools stood respectively as follows: elementary schools, 92,780 and 3,044; high schools, 23,650 and 937. In addition there were 58 private and parochial schools.

Public Welfare, Charities, Correction.—In Nov. 1943 there were 26,985 persons receiving assistance from the state department of social security and welfare. The total state appropriation to the department for 1943 was $1,856,200. Other state appropriations for 1943: industrial school $65,752; juvenile girl offenders $55,000; pioneer home $79,650; prison $182,195; state hospital for the insane $439,000.

Communication.—There was in 1943 a total of 3,678 mi. of highway in Arizona; improved state highway 2,800 mi.; unimproved state highway 877 mi. There were 2,165 mi. of railroads.

Banking and Finance.—National banks in 1943: deposits $169,881,098; loans and discounts $33,707,645; U.S. government securities $90,617,789; stocks, bonds and other securities $3,783,804. State banks: deposits $54,811,930; loans and discounts $9,772,061; U.S. government securities $26,333,411; stocks, bonds and other securities $3,077,201.

Agriculture.—To meet the labour shortage in 1943 many Indians from reservations were employed

Leading Agricultural Products of Arizona, 1943 and 1942

Crop	1943 (est.)	1942
Wheat, bu.	462,000	575,000
Oats, bu.	203,000	252,000
Sorghum grain, bu.	1,728,000	1,190,000
Corn, bu.	402,000	396,000
Cotton lint, bales	139,000	193,000
Grapefruit, boxes	3,900,000	2,550,000
Oranges, boxes	850,000	700,000
Horses, head	73,000	71,000
Cattle and calves, head	911,000	980,000
Sheep and lambs, head	748,000	762,000

Manufacturing.—Less than 10% of the population was engaged in manufacturing. The most important industries were food, textile, metal and lumber products.

Mineral Production.—The mine production of copper for 1942 was 390,500 short tons. Production for 1943 was estimated to be higher than in the previous year. (H. A. H.)

Arkansas. Arkansas is an inland state in the south-central U.S.A., admitted to the union in 1836. Area 53,102 sq.mi., 377 of which are normally under water.

Pop. (1940) of 1,949,387 amounted to an increase for the decade between 1930 and 1940 of 94,905, or a gain of 5.1%. The average of inhabitants to the square mile is 37 persons. There are 53 towns and cities in the state having a total population of 431,910 urban and 1,517,477 rural. The Negro population was 506,770. Capital, Little Rock (pop. 1940, 88,039). Other cities: Fort Smith, 36,584; Hot Springs, 21,370; Pine Bluff, 21,290; North Little Rock, 21,137.

History.—The general assembly met in Jan. 1943 for its 54th regular session. Except for passage of the Abington bill, which outlawed the forcing of strikes by violence, controversial measures were significantly avoided.

The governor in 1943 was Homer M. Adkins, Democrat, re-elected in 1942. Other officers were J. L. Shaver, lieutenant governor; C. G. Hall, secretary of state; Guy E. Williams, attorney general; J. Oscar Humphrey, auditor; Earl Page, treasurer; and Claud A Rankin, land commissioner. The fiscal affairs of the state continued through 1943 on solid footing.

Education.—School attendance declined, as shown by the following comparison of state-wide attendance:

	White	*Negro*	*Total*
1941-42	344,285	109,704	453,989
1942-43	329,611	106,844	436,455

There were 7,292 white and 2,213 Negro teachers in the elementary schools in 1942–43, and 3,627 white and 468 Negro teachers in the high schools.

Public Welfare, Charities and Correction.—The state in 1943 maintained some 30 charitable and correctional institutions, including the state penitentiary farms, the state farm for women, girls' industrial school, boys' industrial school, Negro boys' industrial school, state hospital for nervous diseases, state's general hospital, tuberculosis sanatoriums, school for the blind, school for the deaf, Confederate veteran's home, children's home and hospital. The legislature of 1943 appropriated $4,000,000 for expenditure through the state department of public welfare in the fiscal year 1943–44.

Communication.—The highways, local, state and federal, totalled about 75,000 mi. in 1943. Of the state and federal system of nearly 10,000 mi., about 7,700 mi. were hard-surfaced with asphalt, concrete or gravel. There were about 5,000 mi. of railways in the state in 1943.

Banking and Finance.—On June 30, 1943, there were in Arkansas 161 state banks and trust companies, with combined resources of $204,492,580.95 and deposits of $190,153,515.75; also eight building and loan associations, with resources of $3,456,944.32. There were 51 national banks, with assets of $252,354,000 and deposits of $245,961,000.

The total bonded debt of Arkansas on Dec. 31, 1943, stood at $142,218,016.67, a reduction for the year of $3,707,507.33. On that date, the state treasury had a cash balance, unhypothecated, of $17,700,000.

Agriculture.—Farming in Arkansas in 1943 was hit hard nearly everywhere by the worst drought in the history of the state. Cattle, hogs, sheep and work stock on Arkansas farms at the beginning of 1943 were valued at $118,147,000 There were approximately 216,000 separate farms in the state in 1943.

Table I.—*Leading Agricultural Products of Arkansas, 1943 and 1942*

Crop	Production	
	1943 (est.)	1942
Cotton, bales	1,090,000	1,485,000
Corn, bu.	23,508,000	37,110,000
Rice, bu.	12,600,000	13,515,000
Soybeans (for beans), bu.	2,168,000	3,585,000
Peaches, bu.	738,000	2,337,000

Manufacturing.—Lumber cut from Arkansas forests in 1943 measured in excess of 1,572,598,000 bd.ft. The output of manufactured lumber products was estimated at $100,000,000. The annual output of other industries was estimated in 1943 at $50,000,000, not including the manufacture of aluminum at two new plants built by the federal government at a cost of $70,000,000.

Table II.—*Principal Mineral Products of Arkansas, 1942 and 1941*

Mineral	1942		1941	
	Quantity	Value	Quantity	Value

Mineral Production.—Mining operations in Arkansas in 1942 yielded products valued at $55,472,084. (D. T. H.)

Armies of the World. Because of the military need for censorship, no current data, official or otherwise, are available covering the statistics of this subject. The usual article is therefore omitted for the duration of the war. (For related topics *see* AIR FORCES OF THE WORLD; MUNITIONS OF WAR; SELECTIVE SERVICE, U.S.; WORLD WAR II.)

Armitage, Albert Borlase (1864–1943), British explorer, was born July 2 at Balquihidder, Perthshire, Scotland. He was second in command of the Jackson-Harmsworth expedition to the north pole, 1894–97, and was navigator of the vessel "Discovery" during the British National Antarctic expedition, 1901–04. He served at sea throughout World War I, and was made commodore of the Peninsular and Oriental Steamship Line, 1923. He retired from the P. & O in 1924. Armitage, who had been given the rank of captain, retired, in the royal naval reserve in 1923, died Nov. 2.

Army, U.S.: *see* SELECTIVE SERVICE; UNITED STATES.

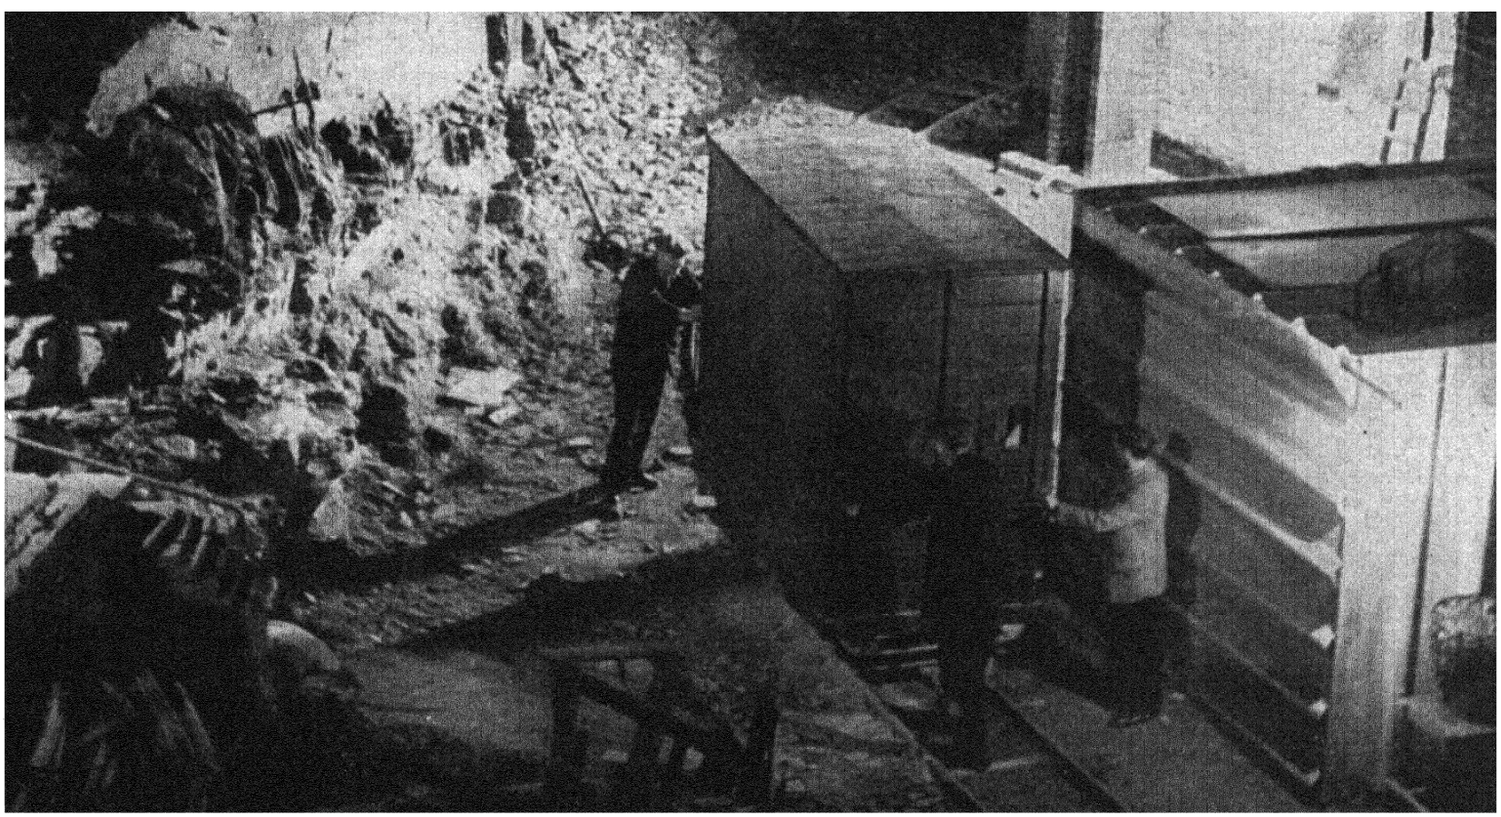
Arnim, Dietloff Juergen von (1891?–), German army officer, was born of a wealthy and noble family. Little is known of his youth and early military career outside of Germany. An expert in tank

warfare, he had worked with Marshal Erwin Rommel before World War II and helped Hitler build up the wehrmacht. One of his first commands was as head of a panzer division. He later was transferred to the infantry and participated in the Polish campaign as commander of an infantry division. Early in the Tunisian campaign of 1942–43, there was considerable confusion as to the exact status of Arnim. In Jan. 1943, it was disclosed that he had been placed in command of axis armies in Tunisia, but later reports said that Marshal Rommel, Marshal Albert Kesselring and Gen. Walther von Nehring were also in command of part or all of axis forces in Tunisia. When Rommel returned to Germany in March 1943, for "reasons of health," Arnim was believed to have been given over-all command. On May 7, 1943, when the Allies took both Bizerte and Tunis, Arnim's units were driven back to the Cape Bon peninsula. On May 12, he indignantly branded Gen. Eisenhower's terms for unconditional surrender as "outrageous," but was compelled to accept them as his armies were shattered beyond repair. He was captured and taken prisoner to England.

Arnold, Henry H. (1886–), U.S. army officer, was born June 25 in Gladwyn, Pa. He was graduated from West Point in 1907 and served in the Philippines until 1909. He set an altitude record in 1912, and was the first aviator to use radio in reporting artillery fire observed from a plane. During World War I he headed the information service of the signal corps's aviation division. Gen. Arnold led a round-trip flight of army bombers to Alaska in 1934. He was named major general, chief of the air corps, 1938. In Oct. 1940, he became the nation's first acting deputy chief of staff in charge of co-ordinating all matters pertaining to the air corps. In May 1941 Pres. Roosevelt made him a full-fledged deputy chief of staff, and on Dec. 15, 1941, the president named him for temporary promotion to the rank of lieutenant general.

In March 1942 Arnold was made commanding general of the army air force, which was put on an equal footing with the ground forces. Just a year later, March 19, 1943, he was made a full general. He was present at the Churchill-Roosevelt conferences at Casablanca, Washington, Quebec, Cairo and Tehran.

Aronson, Naoum (1872?–1943), Russian sculptor, was born in Kreslawka, Russia. In his youth he went to Paris, where he attended the École des Arts Decoratifs for a short time and then studied sculpture by himself. Among his subjects, Aronson prized his busts of Rasputin, Count Leo Tolstoy and Louis Pasteur, a study called "Aronson's Prophet" and a figure of a Jewish leader. He fled France after the nazi invasion and died in New York city, Sept. 30, 1943.



Arsenic. There was almost no information on the subject of arsenic in 1943 beyond the fact that in the Material Substitution and Supply list issued by the War Production board on Oct. 1, 1943, arsenic and its derivatives were included among the materials the supply of which was not sufficient to meet current war and essential industrial demands. (G. A. Ro.)

Art: *see* AMERICAN LITERATURE; ARCHITECTURE; PAINTING; SCULPTURE; etc.

Art Exhibitions. With the increased difficulties of transportation in wartime, museums had been curtailing their juried American exhibitions. The Pennsylvania Academy's annual and the Corcoran biennial in Washington were all invited for the first time. Chicago's Art Institute for the third consecutive year held an all-invitation annual and the Carnegie Institute of Pittsburgh followed suit after omitting their 1942 exhibition. Though closed since March 15, the Whitney museum opened its doors again for a well-selected November annual.

American art was featured in several important special exhibitions, such as Americans 1943—Realists and Magic Realists, and American Romantic Painters, both held at the Museum of Modern Art; Meet the Artist, a lively group of self-portraits assembled by the H. M. de Young museum in San Francisco; the Brooklyn museum's revival of The Eight and Art Begins at

UNDERGROUND MAZE of a shelter constructed for British art treasures in a Welsh mountain. Paintings are moved from one part to another in sealed cars along a 1,000-ft. tunnel

Home featured at the Addison Gallery of American Art in Andover, Mass. This inaugurated a new system whereby art patrons would buy pictures from the exhibition, use them in their homes for a period of time, then give them to the Addison gallery. A distinguished group of 18th century New England portraits was shown at the Worcester Art museum.

Notable one-man showings were the memorial exhibition of the sculpture of Gertrude Vanderbilt Whitney at the Whitney museum; the Alexander Calder retrospective at the Museum of Modern Art; Georgia O'Keeffe at the Art Institute of Chicago, where Edward Hopper was also accorded a room in their American annual; William Zorach at the Downtown gallery in New York; Everett Shinn at the Ferargil gallery; Marsden Hartley at Paul Rosenberg's.

Latin-American art came into even greater prominence with the opening of a series of South and Central American galleries at the Brooklyn museum and the featuring of recent purchases of Mexican and South American paintings at the Museum of Modern Art, which also organized and later circulated an important architectural show, Brazil Builds. Four Latin-American painters were featured by the San Francisco museum and Latin-American water colours were prominent in Brooklyn's and Chicago's International.

Boston's Institute of Modern Art featured Painting and Sculpture by American Negroes.

Two significant benefit exhibitions were held at the Wildenstein gallery in New York: Down the River Seine, a delightful group of French paintings shown for benefit of the *École Libre des Hautes Études,* and an outstanding Van Gogh exhibition for the benefit of the Queen Wilhelmina fund.

War themes were prominent in the year's schedule, as in the exhibition of 123 paintings of America at War commissioned for *Life* magazine, first shown at the National gallery in Washington and later circulated around the country. Airways to Peace at the Museum of Modern Art showed with maps, charts and globes the development of man's conquest of the air. Artists for Victory held a national print competition with the theme America in the War. A hundred prints were selected for showing throughout the country. The Fort Custer Army Illustrators exhibited a new group of lively water colours in the Art Institute of Chicago. A comprehensive exhibition held at the Portland (Oregon) Art museum told the dramatic story of shipbuilding in the northwest. Art of Our Allies was featured at the Boston Museum of Fine Arts. (F. A. Sw.)

SALVADOR DALI explaining the details of one of his pictures at his one-man exhibit of portraits in New York city in April 1943

Art Galleries and Art Museums. Announcement was made in January that the Whitney Museum of American Art was to combine with the Metropolitan museum. After the war a Whitney wing was to be built at the Metropolitan to house the 2,000 works of American art collected by Mrs. Whitney over a 25-year period and shown in the museum which she founded 12 years ago. For the time being the Whitney museum was to continue to function in its old quarters at 10 W. Eighth street.

Albert E. Gallatin removed his notable collection of 170 examples of abstract art from the Museum of Living Art at New York university and lent it to the Philadelphia museum. At his death it is to become their property. In this unusual collection are paintings by Arp, Klee, Duchamp, Miró's "Dog Barking at the Moon," Léger's "The City" and, perhaps most important of all, Picasso's "Three Musicians."

An anonymous donor provided for the setting up of the University of Arizona Gallery of Modern American Painting at Tucson and inaugurated the Arizona plan, whereby he would buy and present to the new gallery 12 paintings a year for a period of five years. The first selections were exhibited at the Metropolitan museum in April.

Another university gallery to buy contemporary Americans was the University of Nebraska, which continued its progressive policy and acquired distinguished works by Max Weber, Marsden Hartley, Julien Binford and Yasuo Kuniyoshi.

The Cleveland museum was fortunate in its recent acquisitions. They acquired a distinguished mature work of Francisco Goya, the "Portrait of Don Juan Antonio Cuervo," and a superb early work of Auguste Renoir, the portrait of Mlle. Romaine Lacaux executed in 1864. Even greater good fortune for Cleveland was the bequest of John L. Severance, which came to them at the close of 1942 but was exhibited as a feature of the year 1943. This collection is noted especially for its 18th century items and contains furniture and minor arts as well as paintings and oriental objects. A Boucher Beauvais tapestry and Nattier's "Madame Henriette" are notable.

Harvard university's Fogg museum received a wealth of material under the terms of the will of Grenville L. Winthrop. This collection of some four thousand items includes a variety of first quality oriental art, Rossetti's "Blessed Damozel," and other Pre-Raphaelite paintings, 52 water colours by William Blake, 40 drawings by Ingres, David's great portrait, "Girl in White Dress." The contents of the Winthrop collection were known to few people and placed the Fogg museum in a position of the greatest importance.

Among additions by the Joslyn Memorial in Omaha, Nebraska, were the "Young Man with a Pink," by Joos Van Cleve, a fine Flemish portrait of about 1520; and Goya's "Marquesa de Fontana."

Buffalo's Albright Art gallery made a notable purchase in Georges Seurat's "Le Chahut," painted in 1889. St. Louis acquired for its museum the "Portrait of Lady Gudeford" by Hans Holbein the Younger, dated in 1527 when the artist made his first visit to England. Murillo's "Virgin and Child," formerly in the collection of the Earl of Crawford, was secured for the Metropolitan museum, and a great Veronese altarpiece,

"Virgin and Child in Glory with Saints," has entered the collection of the Boston Museum of Fine Arts.

Mr. and Mrs. Chester Dale showed outstanding generosity to three museums. To the Art Institute of Chicago they sent on indefinite loan 50 20th century French canvases, including nine Picassos, among which are the famous "Family of the Saltimbanques" and "The Lovers," five works by Braque, Matisse's "Plumed Hat" and Modigliani's "Gypsy Woman with Baby."

To the Philadelphia museum the Dales lent an important group of both 19th and 20th century French and American paintings. Among these are Claude Monet's "Houses of Parliament," Henri Rousseau's "Boy on Rocks," and Toulouse-Lautrec's "Portrait of Jane Avril."

The National gallery in Washington, the third museum to benefit from the Dales's munificence, acquired, in addition to the outstanding loans already received, 11 old masters as a gift. In this group is an exquisite Boucher, "Venus Consoling Love," Zurbaran's "St. Lucy" and two paintings by Chardin.

The National gallery also received 63 American portraits as a gift from the Andrew W. Mellon educational and charitable trust. This notable group was formerly in the well-known Thomas B. Clarke collection and includes 19 Gilbert Stuarts, among which is the famous Vaughan "Portrait of George Washington."

The National gallery was also made the recipient of the superb Lessing J. Rosenwald collection of prints, drawings and manuscripts. Six thousand prints, hundreds of drawings and many rare books make up this wealth of material, which contains priceless 15th century prints, 230 Rembrandt etchings, 367 Whistlers. (F. A. Sw.)

Arthritis. The fundamental processes underlying the development of arthritis were studied in several ways. Five women with typical rheumatoid arthritis were placed under conditions which caused them to lose water from the body. This resulted in a decrease in their joint pains and swellings and an increase in the ability to move easily. These changes were reversed by causing the patients to accumulate body water. In some cases, at least, some of the symptoms of rheumatoid arthritis can be altered by variations in the amount of body water. Emotional stress is known to affect the onset and course of arthritis in many patients. In an attempt to elucidate the cause of this relationship a study was made on the skin temperatures under emotional stress in 25 arthritic and a like number of normal persons. Emotional stress was found to produce a drop in skin temperature indicative of a change in circulation. Comparatively little difference was noted in the two groups, however, and further work was indicated. Other studies showed that the heart and other organs than the joints are more frequently involved in rheumatoid arthritis than had been believed heretofore. This fits with the increasing emphasis on rheumatoid arthritis as a general disease.

According to Bauer and his colleagues the effect of the sulfonamide compounds represents the greatest advance ever made in the treatment of joint disease. These compounds exert dramatic and specific effect against certain of the so-called "specific" arthritides, particularly those caused by streptococci, gonococci, staphylococci, meningococci, colon bacillus and pneumococci. They were not found effective in rheumatic fever, rheumatoid arthritis or tuberculous arthritis. Freyberg evaluated carefully the proposed vitamin and endocrine treatments for chronic arthritis. In spite of favourable reports to the contrary he concluded that there was no vitamin or endocrine preparation which had a direct relationship to the common forms of rheumatic disease. Their value lay only in their effect on the general health. Good results with several different kinds of gold compounds were reported as in previous years. In spite of extensive search a satisfactory nontoxic compound was not found. Although certain gold salts appeared to be of value for rheumatoid arthritis they should be taken only under experienced and competent medical supervision.

Surgeons reported some delicate and successful operations for the rehabilitation of joints already damaged by arthritis. This was not treatment in the strict sense, but was most important from the standpoint of restoring joint function. Industrial physicians recognized that arthritis varies in its ability to incapacitate all the way from mild joint pain to complete crippling. Satisfactory placement in industry for persons with arthritis is important and requires reason, sympathy and good common sense on the part of all concerned. Reports on the nature and frequency of arthritis among those in military service were not available but judging from previous military experiences it was almost certain that the problem of treatment and rehabilitation of service-acquired arthritis would be considerable.

Art Sales. Auction prices were up because of the closing of European markets and the prevalence of interested buyers, and auctioneers had an especially busy year. Parke-Bernet galleries did a $3,600,000 business during the 1942–43 season, the second highest for 10 years. Their top sale was the collection of Mr. and Mrs. Charles E. F. McCann, which brought $266,207. Many purchasers were foreign collectors in the United States for the duration. The Wadsworth Lewis collection of furniture, tapestries and Chinese art brought $187,238 A sale of unusual interest was Frank Crowninshield's modern French art, which totalled $131,365. In this sale Modigliani's "Madame Hebuterne" and Picasso's "Portrait of Braque" each brought $4,800, Forain's "Folies Bergère," $5,900 and Segonzac's "L'Église et La Marne, Champigny," $7,250.

Gimbel's, including the department in the Kende galleries at the Jay Gould mansion, concluded their 1942–43 season at $44,225,000. Much of the material was from the Hearst collection; others were Stanley Bliss, Ewing Hill, and the stock of Marcus and Co., jewellers. They estimated 30,000 new collectors in the buying field.

A mild Bouguereau revival took place when Durand-Ruel acquired his 12-foot "Nymphs and Satyr" and sold it to a private collector at a reputed $12,000.

In London the salesrooms had the same brisk business as the New York auction houses and prices were maintained at a high level. Both Christie and Sotheby reported especially lively bidding in antique silver. L. W. Neeld's collection brought just under £8,000 for 15,000 ounces of silver. A George II salver brought £200. A record price was established when a single spoon dated 1481 brought the equivalent of $5,200. At Christie's sale of pictures belonging to the Countess of Oxford and Asquith, a Canaletto, "View of the Church of San Bartolomeo," brought $3,988. Morland's "A Winter's Morning" went for $924, indicating the continued popularity of the British school of painting on home soil.

A Bartolozzi coloured engraving of Lawrence's "Miss Farren" went for $1,932.

It was reported that sales continued to fetch high prices in Paris, Amsterdam and other continental centres under German domination. Since occupation money of questionable worth was used in these transactions, the sales could not be considered a valid measure of real values. (F. A. Sw.)

Asbestos.

Because of its position as a strategic mineral, no official data were published on asbestos output in any of the important producing countries for several years, and even the data on the small United States output was not reported for 1942. The Material Substitution and Supply list issued by the War Production board on Oct. 1, 1943, listed asbestos textiles as short in supply but cement sheets and short fibre were available in amounts in excess of current demand.

Asphalt.

The usual detailed statistics on petroleum asphalt production in 1942 were not made public, but a heavy increase in the United States was reported in the output of native asphalt, from 691,168 short tons in 1941 to 975,373 tons in 1942. The use of various types of petroleum asphalt in airport runway construction would indicate a marked increase in output.

(G. A. Ro.)

Assassinations.

The assassinations of 1943, actual or attempted, included the following:

Jan. 11. New York, N.Y. Carlo Tresca, anti-fascist leader and editor of Italian-language weekly, was shot and killed as he was leaving his office. His assailant escaped in a motor car.

Feb. 5. The Hague, Netherlands. Gen. Hendrik Alexander Seyffardt, pro-nazi army leader, was shot and mortally wounded outside his home.

Feb. 12. Netherlands. Reports reaching London said Dutch underground group known as "The Black Hand," shot and fatally wounded C. van Ravenzwaai, pro-nazi Netherlander who held portfolio as secretary for social affairs in Mussert cabinet.

April 15. Sofia, Bulgaria. Sotir Janeff, president of the Bulgarian parliament foreign affairs commission, editor of the semi-official *Slovo* and adviser to King Boris III, was shot and killed by two unidentified assassins, both of whom escaped. Janeff was a strong pro-nazi.

Aug. 28. Sofia, Bulgaria. Boris III, king of Bulgaria, died after a short illness. The official statement attributed his death to a heart attack, but it was widely rumoured that he died of a gunshot wound administered by an assassin.

Association for the Advancement of Science, American: *see* AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Association of Research Libraries.

The Association of Research Libraries is an association of 47 of the largest research libraries in the United States and Canada. Forty of the members are university libraries. Ordinarily there are two meetings a year, but in 1943 the only meeting was in Chicago on Jan. 31.

Most of the work of the association is done by committees. A committee on indexing and abstracting in 1943 was continuing an extensive study of the so-called "service basis" in selling indexing services. Other important committees were one on preventing postwar competition in book purchases, and one on filming of 19th century newspapers.

The most ambitious project of the association was the promotion of a printed book catalogue of the Library of Congress cards. A committee secured permission from the Library of Congress for the publication, made arrangement for its printing by the photo-offset process, and secured the necessary subscriptions. At the close of 1943, 53 of the proposed 160 volumes were published. The completed catalogue was expected to be one of the most important bibliographical tools in any research library, since it would list in alphabetical order all the books in the Library of Congress catalogued with printed cards and would reproduce all the bibliographical information on these cards.

The association also published *Doctoral Dissertations Accepted by American Universities, 1942–43,* completing ten years of such a classified list.

Astronomy.

Solar System.—*The Sun.*—Both physicists and astronomers have long been interested in the chemical composition of the sun. Determination of which of the 92 chemical elements exist in the solar atmosphere is accomplished by a detailed study of the lines in the solar spectrum. The success of this study is dependent on the results of the laboratory studies of the spectra of various elements, as well as on theoretical investigations. During 1943, Charlotte E. Moore and A. S. King announced the identification in the solar spectrum of the lines of two elements not heretofore known to exist in the solar atmosphere—thorium and gold. Their detection raised to 66 the number of chemical elements identified. The presence of thorium in the sun is especially interesting, since it is the first radioactive element detected there. Failure of the remaining 26 of the 92 chemical elements to be detected in the solar spectrum does not necessarily mean that these elements are absent from the sun. For six of these elements the laboratory data on wave-lengths and intensities were inadequate in 1943. Of the remaining 20 elements, 11 have their strong spectral lines in an unobservable region of the solar spectrum, and five are radioactive elements of relatively short life. The other four elements have their strong lines in the observable region, and hence, if present, they must exist in such small amounts as to remain undetected.

Planetary System.—Five comets were discovered during 1943. Two of these proved to be rediscoveries of previously known comets, whereas the other three were observed for the first time. Two discovered by van Gent and by Diamaca were just below naked-eye brightness; the third, discovered by Miss Oterma, was of fifteenth magnitude.

Few observations of cometary spectra in the red beyond λ 5500 had heretofore been made. Swings, McKellar and R. Minkowski measured spectra of two bright comets in this region of wave-lengths, and compared these spectra with that of an oxy-ammonia flame. They found that some of the more prominent spectral features exhibit a behaviour to be expected from polyatomic molecules. Comparison with the oxyammonia flame led to tentative identification of several hitherto unidentified emission features in the cometary spectra as being due to a dissociation product of ammonia, probably to NH_2.

Observations of the surface features of the planets are exceedingly exacting, requiring both great skill and exceptional atmospheric conditions. M. Bernard Lyot and his associates at the Pic du Midi combined skill and excellent observing conditions to obtain some remarkable observations of Mars, and also of Jupiter, Saturn and Mercury. Their observations of the surface features of Mars showed a wealth of detail, and seemed to establish beyond question the semi-geometric nature of many of the surface markings on this planet. Of particular interest are their observations of surface features on the four bright satellites of Jupiter. Sufficient details of the surface features were observed to permit the preparation of maps for each of these satellites.

Stars.—*Special Stars and Stellar Structure.*—An extensive

series of photographs of the visual double star 61 Cygni was obtained by Strand. From a study of these and other observations Strand found perturbations in the orbit of the visual components which are produced by a third and invisible body. These observed perturbations can only be explained satisfactorily if the third invisible body has the exceedingly small mass of 0.016 that of the sun, or 16 times the mass of the planet Jupiter. Since the smallest stellar mass previously known is 0.14 the sun's mass, this dark companion must have so little luminosity, if indeed it has any, that it can be considered a planetary object rather than a star. Thus for the first time in history a planet has been discovered outside the solar system. This planetary object moves about one of the visible components of the double star in a period of 4.9 years, the eccentricity of its orbit being 0.7. The semi-major axis of its orbit is 2.4 astronomical units, but due to the large eccentricity of its orbit, the planetary body comes within 0.7 astronomical units of its visible companion The three body system of 61 Cygni is 11 light years away from us, making it one of the sun's nearest neighbours. The two visible components are red dwarf stars which revolve around their common centre of gravity in a period of 720 years. Strand's discovery of a planetary body outside the solar system was expected to affect profoundly the viewpoint of astronomers concerning the probability of the existence of other planetary systems.

The results of a study by Adams of interstellar lines in the spectra of 50 stars are of singular interest. The most prominent interstellar lines are those of calcium and hydrogen. In many of the spectra studied these lines are double or multiple, the different components being produced by interstellar clouds with differing radial velocities. The individual components of these interstellar spectral lines are sharp and narrow, indicating that the interstellar clouds of gas which produce them are discrete and have little internal motion. Adams found a general cloud in the direction of the bright stars in Perseus having a residual velocity of recession of 5 km./sec. In the direction of Orion, on the other hand, the clouds seem to be more broken and intermingled, and perhaps more turbulent than in most parts of the sky. Six stars in or close to the belt of Orion show the presence of two clouds, one with a velocity of recession of 7 km./sec. and the other with a velocity of approach of 15 km./sec. Some of the interstellar clouds observed show remarkably high radial velocities, higher than would be expected for these clouds. For example, a cloud in the direction of Sagittarius is receding at a velocity of 40 km./sec., and two clouds in the direction of Cygnus show velocities of recession of 41 km./sec., and 60 km./sec.

External Galaxies.—Hubble observed the direction of rotation in 15 spiral nebulae in which the spiral arms can be traced, and in which a general criterion for the tilt can be applied. By applying this general criterion to the 15 nebulae he found that all of them are rotating in the same direction There still remained an ambiguity in regard to the tilt, so that although the fact of common rotational direction appeared to be established, the actual direction, *i.e.*, whether the arms were all trailing or all leading, remained uncertain. In the case of four of these spirals Hubble was able to apply a special criterion for tilt which was free from ambiguity, and he found that in these spirals the arms are trailing. Since he had already tentatively established that all 15 rotated in the same direction, it appears that we might assume, at least as a working hypothesis, that the arms of all spirals are trailing. This conclusion is of prime importance for attempts to explain the origin and development of the spiral arms.

Phenomena Visible in 1944.—*Jan. 25, 1944. Total Eclipse of the Sun.*—Visible in northern South America and northwestern Africa, with maximum duration in central Brazil. Partial phases visible in Florida and along the gulf coast of the United States near sunrise, and in Spain, southern France and the southern tip of England near sunset.

July 20, 1944. Annular Eclipse of the Sun. Visible in east central Africa, northern India, Burma and Indo-China, the southern Philippine Islands, along the north coast of New Guinea and on New Britain. Partial phases visible in the near east, southern Russia, China, Japan, Philippine Islands, the East Indies and Australia.

Athlone, 1st Earl of

(ALEXANDER AUGUSTUS FREDERICK WILLIAM ALFRED GEORGE CAMBRIDGE) (1874–), British statesman, was born April 14 at Kensington palace, the third son of the 1st duke of Teck. Educated at Eton and the royal military college, Sandhurst, he served in Matabeleland, Southern Rhodesia, in 1896 and saw action during the Boer war. During World War I he was mentioned twice in dispatches, and in 1917 he was created 1st earl of Athlone. He was governor general of the Union of South Africa from 1923 to 1931. In 1936 he was appointed personal aide-de-camp to the king. He was appointed 16th governor general of Canada April 3, 1940, on the death of Lord Tweedsmuir. In a speech on Dec. 10, 1942, he defended Britain's imperial system, asserting that the independence of dominions was "a fact and not a fiction." In Aug. 1943, he gave a state dinner for Churchill and Roosevelt at Quebec. Subsequently, as acting chancellor for London university, he conferred an honorary degree on Roosevelt. In September he visited Alaska and inspected the new Alaskan highway.

Attu: *see* ALASKA; WORLD WAR II.

Auchinleck, Sir Claude John Eyre

(1884–), British army officer, was born in England, the son of Col. John Claude Auchinleck. He served in India in 1902, and was stationed in Egypt and Mesopotamia during World War I. In 1933 and 1935 he fought against native tribesmen on the northwest Indian frontier. In the spring of 1940 he was made commander of the Allied forces in northern Norway. He took Narvik but was forced to evacuate the city when the Allies failed to make additional landings in the south. In the summer of 1940, after the collapse of France, Auchinleck was appointed general officer commanding the English southern command, and he organized the first defenses of England to forestall the threatened German invasion. In Dec. 1940 he returned to India as commander in chief. In July 1941 he was made commander in chief of British middle east armies, succeeding Gen. Sir Archibald Percival Wavell. Auchinleck's armies in Libya launched an offensive Nov. 18, 1941, and advanced far into Libya, but were driven out in June 1942. Auchinleck then took over command of the British 8th army. On June 18, 1943, he was again made commander in chief in India. Responsibility for operations against Japan were at this time transferred from the Indian to the newly formed east Asia command.

Australia, Commonwealth of.

A self-governing member of the British Commonwealth of Nations, situated in the southern hemisphere between longitudes 113°9′ E. and 153°39′ E. and latitudes 10°41′ S. and 43°39′ S.; national flag, a blue ensign, with the Union flag in the quarter and six white stars in the field. Language, English;

AUSTRALIANS hauling gasoline cans away from a blazing fuel dump in New Guinea after Japanese bombers had scored a direct hit on the dump

religion, Christian (census 1933: Anglican, 2,565,118; Roman Catholic, 1,161,455; Presbyterian, 713,229; Methodist, 684,022; other Christians, 603,914). Ruler, King George VI; governor general (1943): the Rt. Hon. Lord Gowrie, V.C.; prime minister, Rt. Hon. John Curtin.

Area, 2,974,581 sq.mi.; pop. (est. Dec. 31, 1941) 7,137,221. Capital, Canberra. Chief cities (pop. Dec. 31, 1940): Canberra (11,000), Sydney (1,310,530), Melbourne (1,076,000), Adelaide (330,000), Brisbane (335,520), Perth (228,000), Hobart (66,620), Newcastle (116,000).

History.—In accordance with the constitution it was necessary for a general election to be held at the latest in Nov. 1943. When John Curtin assumed office at the end of 1941 he was given full co-operation by the opposition parties under A. W. Fadden, but with the barest of majorities had but a precarious hold on office. The party truce virtually came to an end at the beginning of 1943 when Curtin introduced his militia bill. This bill empowered the government to use the militia for service beyond the confines of the commonwealth and its territories, but within an area (the S.W. Pacific) defined by the bill. The opposition had expected that such forces would be merged with the A.I.F. for service in any part of the world as strategy might require and felt that the government had broken its own promises at the dictate of the Labour caucus. As the year proceeded the opposition became increasingly critical of the prime minister's alleged weakness in dealing with labour unrest and accused him of introducing purely party legislation. In June the premier faced a censure motion, and though the government won by one vote—that of an independent—Mr. Curtin immediately announced his intention of seeking a dissolution. The election was held on Aug. 21 and resulted in the government's being returned with a net gain of 13 seats, losing only one seat—in Queensland. In the senate Labour won all 19 vacant seats, thus gaining a clear majority in both houses. The result was partly due to the lack of cohesion and leadership in the opposition parties, but was in the main a tribute to the leadership of Mr. Curtin.

On Nov. 15, 1943, announcement was made in London that the duke of Gloucester had been appointed to succeed Lord Gowrie as governor-general of Australia.

In Nov. 1942 a special constitutional convention had met in Canberra to consider ways and means of transferring powers from the states to the commonwealth for the purposes of postwar reconstruction. It was agreed that state premiers should submit to their respective legislatures a draft bill listing 14 powers "to make laws in relation to postwar reconstruction" which should be referred to the commonwealth parliament for a period of five years to begin at the cessation of hostilities. During 1943 two states—New South Wales and Queensland—adopted the bill without qualification. Victoria, South Australia and Western Australia passed bills in a more or less mutilated form and in Tasmania the upper house twice rejected it altogether. The only solution of this urgent problem seemed to be for parliament to seek the necessary powers through an amendment to the constitution by means of a referendum which would probably be held early in 1944.

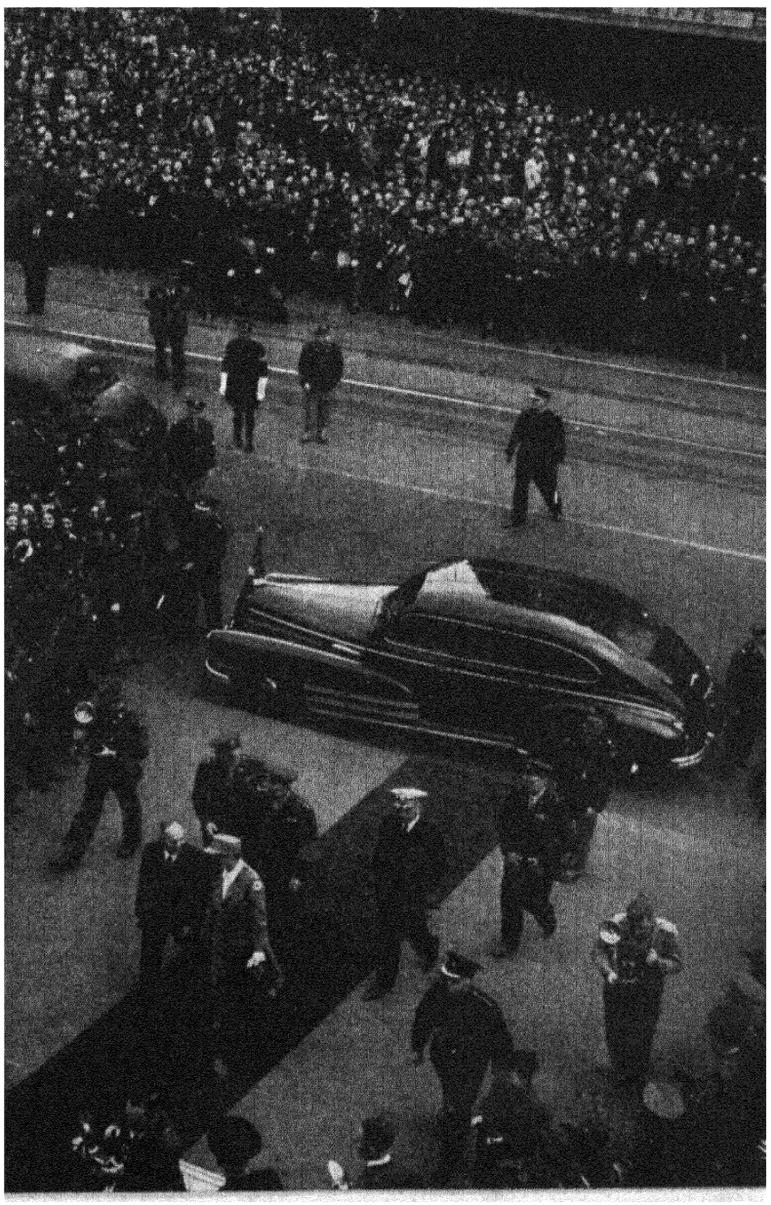
External Affairs.—The government decided that the war had demonstrated the desirability of Australia's developing a foreign diplomatic service of her own. In furtherance of this policy William Slater was appointed minister to the U.S.S.R. and took up his post at Kuibyshev in January. In October, Lt. Gen. Sir Iven Mackay was appointed first high commissioner in India and Thomas D'Alton became first high commissioner in New Zealand. On Nov. 5 Joseph Maloney, president of the New South Wales trades and labour council, was appointed to succeed William Slater as minister to the U.S.S.R. A diplomatic staff cadet system was introduced and a special training school was inaugurated.

In May the Australian legation at Kuibyshev took over the representation of Polish interests in the soviet union following the dispute between the soviet and Poland which resulted in the interruption of diplomatic representation.

During the year Herbert V. Evatt, the minister for external affairs, visited Washington and London to confer with President Roosevelt and Prime Minister Churchill, to discuss Pacific policy in relation to world strategy, and to strengthen the government's contacts with the Australian minister in Washington and the high commissioners in London and Ottawa. S. M. Bruce's appointment as high commissioner in London was extended for another year.

Public Finance and Economic Affairs.—During 1943 the economic life of the nation was subordinated to the overriding necessities of war. The government was faced with increased manpower requirements for the production of munitions of war, food, clothing and other essential supplies and services for their own and Allied forces and for defense construction works. The total working population was increased by bringing into industry people who were previously not engaged in work and it was estimated that the working population was 620,000 higher than before the war. Inevitably, however, the transfer of workers to the armed forces and munitions involved a great reduction in civilian goods and services and rationing was extended to a large number of commodities. Measures were introduced for the pooling of farm machinery and the planned production of foodstuffs which enabled primary production to be maintained in spite of 30% of the farm labour having been diverted to the services and munition works. To forestall inflationary tendencies the government placed a ceiling on all prices, to be held in the last resort by subsidies. The scheme came into operation in April and was working smoothly, the subsidies in the first year being estimated at £A.12,000,000. Further progress was made in the decentralization of industry and large sums were voted for the establishment of munition and other essential works in rural areas.

In February J. B. Chifley, the treasurer, submitted revised estimates which showed that war expenditure was likely to exceed the budget estimate of £A.390,000,000 by some £A.70,000,000. Concurrently he introduced increases in income tax on individuals estimated to produce £A.40,000,000 in a full year. He also announced the immediate establishment of a national welfare fund, to be financed out of revenue, of £A.30,000,000 per annum, or one-fourth of the total revenue collections from income tax on individuals, whichever were lower. Measures were introduced granting increased war pensions and repatriation benefits and a new maternity benefit of 25*s.* a week for six weeks and increased maternity allowances. The fund would ultimately finance sickness, unemployment, medical, hospital and dental services. In the meantime surpluses in the fund would be loaned to war expenditure. For the fiscal year ended June 30, 1943, total expenditure was £A.670,305,000, war expenditure accounting for £A.561,743,000, of which £A.158,891,000 was provided from revenue. Of the balance, £A.215,357,000 was raised by public loans and the sale of war savings certificates; temporary use of treasury balances provided £A.8,420,000; while £A.179,075,000 was financed by treasury bills discounted with the Commonwealth bank. Within a week of the opening of the new parliament in September, Chifley introduced his budget for the fiscal year 1943–44. Expenditure for purposes other than war was estimated at £A.144,526,000, an increase of £A.35,963,000 over the last year. Principal increases were: national welfare fund £A.29,750,000; increased war pensions £A.1,090,000; invalid and old age pensions £A.807,000; child endowment £A.595,000; widows' pensions £A.421,000. Expenditure from the national welfare fund would be less than £A.2,500,000 during the year, so that more than £A.27,000,000 would be available for war loans. War expenditure was estimated at £A.570,000,000 of which £A.403,000,000 not covered by revenue was to be financed by loans.



Education.—In 1939: state schools, 9,940; average attendance, 744,095; teachers employed, 31,199; private schools, 1,863; average attendance, 219,171; teachers, 11,496; technical schools, 94; total enrolment, 101,155; teachers, 3,276; business colleges, 122; total enrolment, 24,337; teachers, 727; universities, 8; total enrolment, 14,236.

Banking and Finance.—Revenue (actual 1942–43), £A.267,453,000; (est. 1943–44), £A.312,087,000; expenditure (actual 1942–43) ordinary, £A.108,563,000; defense, £A.561,743,000; (est. 1943–44) ordinary, £A.145,000,000; defense, £A.570,000,000; public debt (June 30, 1943) £A.2,006,000,000; notes issued April 26, 1943, £A.135,900,000; gold and sterling reserve (June 30, 1942), £A.35,141,000; exchange rate, £A.125=£100 sterling (1£=403.5 cents U.S. in Dec. 1943).

Trade and Communication.—Overseas trade 1941–42 (merchandise): imports, £A.187,068,136; exports, £A.159,328,498. Communications and transport: 1940, roads, total mileage, *c.* 450,000; railways open to traffic (Dec. 1942) 27,159 mi.; airways (1942), distance flown, 7,666,000 mi.; passengers carried, 151,927; goods carried, 2,347,000 lb.; mails carried, 1,226,500 lb.; motor vehicle registrations (March 31, 1943): cars, 466,573; commercial vehicles, 255,379; cycles 48,286; wireless receiving set licences 1,393,872; telephones, number of lines, 537,702.

Agriculture, Manufacturing, Mineral Production.—Produc-

MRS. FRANKLIN D. ROOSEVELT arriving at the town hall in Sydney, Australia, during her five-week tour of the South Pacific in Aug. and Sept. 1943

WITHIN A HALF MILE of the fighting front, Australian troops in New Guinea cast their votes in the federal elections of 1943

tion, (in metric tons): wool (1942) 513,000; wheat (1942–43) 4,311,000; oats (1940–41) 185,000; barley (1940–41) 162,000; maize (1940–41) 233,000; rice (1941–42) 56,000; potatoes (1940–41) 462,000; cane sugar (1940–41) 820,000; wine (1940–41) 725,000 hectolitres; gold (1941) 35,960 kg.; coal (1941) 15,200,000; statistics for all other minerals not available for publication. Total value of production in £ Australian: (1940–41) pastoral and dairying 173,755,000; mineral 40,002,669; manufacturing 257,914,349. Labour and employment: employment in factories (1928–29=100) Feb. 1943, 170.0; number (March 1943) 736,000; unemployment, trade union returns (March 1943) 1.2%; total recorded material production (1940–41) £A.550,754,000. Automobile Industry in the War.

At the end of the second year of 100% war production, the automotive industry was operating at the rate of $10,500,000,000 a year. This was more than twice the industry's production in the previous peak year, 1941

The estimated aggregate value of war production by the automotive industry in the calendar year 1943 was $8,840,000,000 In addition, the industry produced essential replacement parts for motor vehicles valued at approximately $500,000,000 during 1943. The combined output of war articles and government authorized repair parts totalled $9,340,000,000.

In the third quarter of 1943, aircraft engines, airframes, propellers and aircraft subassemblies and parts comprised 40% of the automotive industry's war production; military vehicles and parts constituted 28%, tanks and parts 12%, guns of all types 7%, ammunition 4%, marine equipment 6%, and miscellaneous other war products 3%.

The annual rate of aircraft production by the automotive industry at the end of 1943 exceeded $4,000,000,000. This rate, for aircraft alone, was greater than the total dollar volume of motor vehicles produced in the peak year 1941. Military vehicle production rate at the end of the year was 2½ times the 1941 actual volume of motor truck production.

The dollar volume of tanks and parts turned out by the automotive industry in the calendar year 1943 likewise exceeded the total dollar volume of motor truck production in the highest previous peacetime year.

The immensity of the volume of fighting equipment produced by the automotive industry may be more clearly visualized by translating the annual rate of $10,000,000,000 attained at the end of 1943 into physical units of bombers, fighter planes, tanks and vehicles. Converting the dollar volume of production in each of the major categories by dividing the average cost per unit into the aggregate dollar volume of each group, the following figures are obtained:

1 Aircraft, aircraft engines and parts equal in cost to 166 squadrons of aircraft each consisting of 15 heavy bombers, 30 medium bombers, and 90 fighter planes.

2. Military vehicles, tanks and parts equal in value to the cost of 110 armoured divisions of 3,314 vehicles each.

3. Marine equipment, equal in value to the cost of 100 submarines and 1,540 motor torpedo boats, and

4. $1,400,000,000 worth of cannon and machine guns of various sizes, ammunition of various sizes, and other war products.

Total war orders received by the industry during the period from Sept. 1, 1939, to Dec. 31, 1943, exceeded $29,000,000,000. Unfilled orders on hand at the year-end were approximately $14,700,000,000.

Specification changes, cancellations or "cutbacks" in orders became fairly numerous as the year progressed, but despite these handicaps the overall monthly totals of war product deliveries continued to climb throughout the year, with one exception.

As indicated above, the major production assignment given the industry consisted of aircraft products. Four complete planes, ready to fly, were in production Parts and subassemblies for many other types of combat craft were in production.

The huge volume of fighting equipment turned out by the industry was made possible by the practice of subcontracting, which was also a common practice prior to the war in the production of motor vehicles. An incomplete survey at the beginning of 1943 indicated that plants in 1,375 cities were engaged in the production of war products for former motor vehicle and parts manufacturers. These plants were scattered from coast to coast, and in 44 of the 48 states.

Fifty-six cents out of every dollar received by manufacturers in the industry were paid to subcontractors and vendors Most of the subcontractors and vendors were small firms employing only a few hundred workers; 35% of the firms employed from 100 to 500 employees, and 28% of the subcontractors and vendors employed less than 100 workers.

An analysis of 33 typical war products, including such items as tanks, machine guns, aircraft cannon, aircraft engines, bomber fuselages, aerial torpedoes, gyrocompasses, indicated that 33,182 parts out of a total of 50,880, or 65%, were furnished by subcontractors The percentage of parts subcontracted in certain items ranged as high as 98% or 99%. For example, an aerial torpedo with 5,112 parts included 4,999 parts which were furnished by subcontractors, or 98%. An aircraft cannon composed of 267 parts had 264 parts subcontracted, or 99%.

Engineers and production men trained in the mass production techniques of the motor industry of prewar years were able to devise shortcut methods, save materials and time in turning out the most intricate weapons of war. It was estimated that the dollar savings to the government and the taxpayers made by the special skills applied in the industry already amounted to more than $1,000,000,000. In particular instances the original cost of the product was cut in half.

During 1942 and the early part of 1943, materials shortages constituted the number one problem, aside from the main task of increasing the production and delivery of goods to the armed services. In the latter half of 1943, the number one problem became manpower. The industry undertook a number of steps to relieve the scarcity of qualified workers, and there already were indications that the problem was well on the way to solution.

Despite the drafting of an estimated 155,000 men from the former motor vehicle and body manufacturing plants into the army, employment continued to climb steadily throughout the year, reaching a total of 835,000 wage earners in December. This compares with a total of 636,000 in Dec. 1942, a gain of 31%. In Oct. 1943, 26.5% of all wage earners in the industry were women, as compared with 14.8% in January. Employment in former motor vehicle and body manufacturing plants in December was 63% above the prewar peak in June 1941. Average weekly wages per individual worker, and average hourly rates were also at the highest level in the history of the industry.

Keeping in mind that the subcontractors for a particular war product might be scattered from the east to the west coast, it can readily be seen how vital a role was played by transportation in serving as a virtual extension of the final assembly line. In cases of emergency, motor truck service was found especially useful in keeping the war plants in operation without the necessity of closing down for lack of parts or materials. The speed and flexibility of truck transportation was a lifesaver in thousands of war plants, when other means of transportation were not able to deliver in time. Besides the emergency situations where motor trucks came to the rescue, there were of course the regular day-to-day chores performed by motor trucks.

There were no records available on the totals in tonnage or ton miles of products transported by all types of motor trucks, but monthly indexes were compiled by the American Trucking association covering for-hire vehicles. These indexes indicated that for-hire trucks transported 28% more goods in 1943 than in 1941.

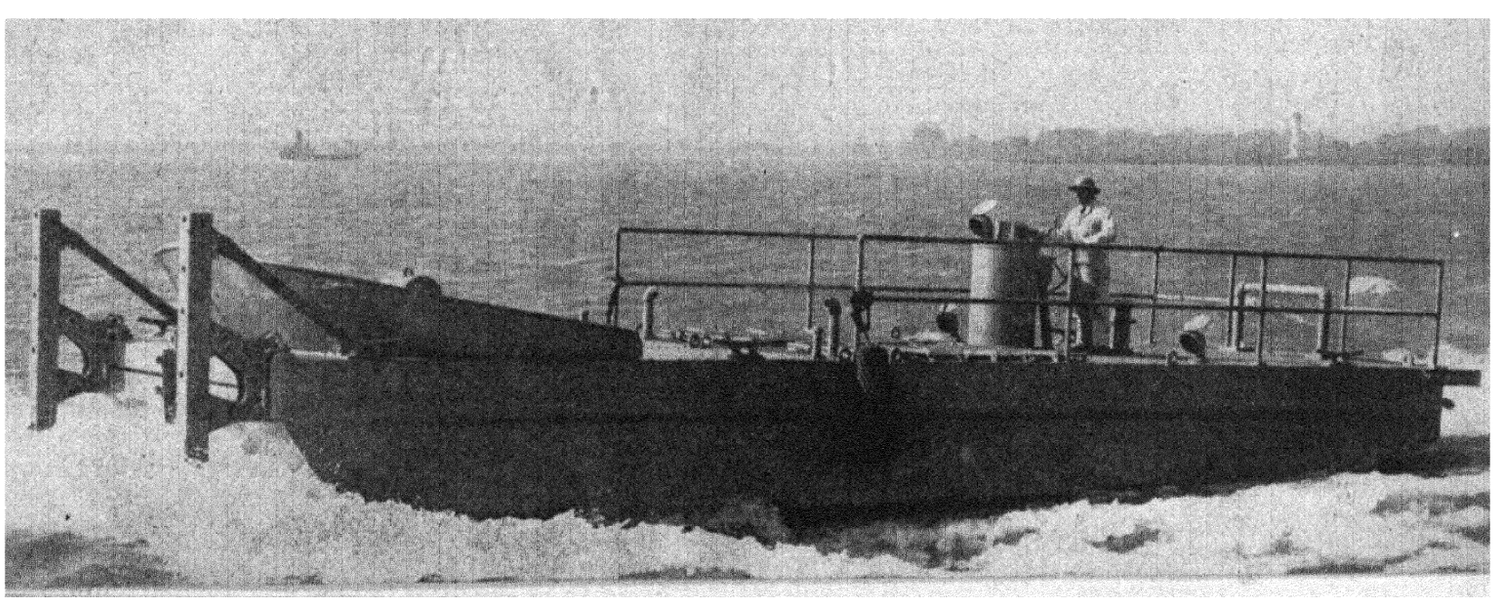
Transportation surveys made by state agricultural colleges in Missouri and Minnesota, covering 1,300 small firms in 15 counties, showed that 47.5% of all inbound freight was hauled by trucks and 49.6% of all outbound freight was shipped by trucks. In certain types of commodities, 100% of the inbound and outbound shipments moved over the highways.

During the period from Jan. 3, 1943, to Dec. 11, 1943, 76,071 motor trucks were released to civilian ration certificate holders and under government exemption permits. Total registrations of motor trucks at the end of 1943 decreased 3.7% below the preceding year, to approximately 4,500,000.

Despite gasoline shortages, private automobiles continued as the chief means of going to and from work. Surveys of 94 war plants by the war department indicated that 73.1% of the workers travelled by automobile, 13.2% by motor bus, 2.4% by other mass transportation methods, 1% by bicycle and motorcycle, and 10% walked; 56.5% of the total automobile mileage driven by these war plant workers consisted of driving to and from work, 14% in shopping, 14.3% in driving children to school, hauling products and business trips. Altogether, 84.8% of the mileage was for necessity purposes, while only 15.2% was for nonessential purposes.

Surveys by other organizations and in other places tended to corroborate the results of the survey in the 94 war plants indicating the automobile as the mainstay of worker transportation.

Intercity bus travel during 1943 increased approximately 150% above the average for 1941, while city bus and streetcar travel gained approximately 60% over 1941.



The best overall measure indicating the trend in total use of motor vehicles of all types was perhaps to be found in surveys by the U.S. Public Roads administration, compiled monthly. One of these indices consisted of counts of motor vehicles passing approximately 600 automatic traffic recorders, located at strategic points throughout the country. The average traffic in eastern states, where gasoline rationing began in May 1942, showed a decrease of 50% or more below the average of 1941. The average traffic in states where gasoline rationing began Dec. 1, 1942, reflected a decrease of 40% below the average of 1941.

Another general index compiled by the U.S. Public Roads administration on a monthly basis was developed from state gasoline tax collections. This index indicated a decrease of 39% in gasoline tax collections in those states where gasoline rationing began in May, and 28% in those states where gasoline rationing went into effect Dec. 1, 1942. The combined weighted average decline was approximately 33% below 1941.

Shortly after Pearl Harbor, leaders of the industry felt that the entire automotive industry, including former manufacturers of passenger cars, trucks, buses, taxicabs, and automotive replacement parts and accessories could do a much more effective job if they co-ordinated their efforts, so they organized the Automotive Council for War Production on Dec. 31, 1941.

Under the leadership of the board of directors and more than 50 committees on special subjects, the industry was able to produce and deliver nearly $13,000,000,000 worth of fighting equip-

THE "SEA MULE" tug, powered by a marine engine, was put to use by the U.S. armed forces in 1943 to push or tow barges or other cargo-carriers. Built in four sections at Detroit, it can be readily transported by truck, railroad or ship. One of its notable advantages is its shallow draft

ment to the armed services of the United Nations.

The 1943 production in terms of dollars was nearly six times as great as that of Dec. 1941.

Whenever a problem arose, a special committee was set up to aid in the solution. When conversion from peacetime to war work as rapidly as humanly possible was necessary, the council organized machine tool exchange and tooling information services which aided the manufacturers materially in locating the right machines and sources for the production of tools, dies, jigs and fixtures. Thousands of machines were loaned or sold to other manufacturers in the industry whenever the owner did not have any use for this equipment. Many machines were even shipped to Great Britain, Russia and China.

No sooner had the conversion and tooling-up problem been solved than shortages of materials developed. A committee of experts on materials was established to work closely with the War Production board and armed services in advising on the best procedures to be followed in the proper allocation and distribution of the steel, aluminum, copper and other vital sinews of war.

Although there were still shortages in certain kinds of materials in 1943 and a continued need for control to insure proper distribution to manufacturers of weapons in greatest need, there were indications that the materials bottlenecks were being broken.

The Automotive council committees most active in 1943 were those working on manpower problems. A committee on the supply of workers was working with national and local government agencies in developing new sources. Another committee on the utilization of labour conducted surveys and exchanged ideas on most effective ways of increasing production with the limited supply of workers available. Subcommittees on absenteeism, health, morale, all contributed their bit. From the beginning, other committees dealing with special war products such as aircraft engines, airframes, tanks, military vehicles, met at the council headquarters or in one another's plants to exchange technical information on ways of speeding up production, conserving materials, or developing shortcuts of various kinds.

A great many other problems were being handled by team work among the former competitors who now pooled their special knowledge for the benefit of soldiers on the fighting fronts throughout the world. (*See* also BUSINESS REVIEW.) (O. P. P.)

Aviation, Civil.

Military requirements dominated civil aviation activities throughout the world in 1943. During that year, as the aerial might of the United Nations achieved decisive supremacy over the air forces of the axis belligerents in all theatres of the war, the function of commercial air lines (for the most part operated by U.S. companies) was to transport strategic supplies, equipment and personnel between sources of raw materials, production centres and the fighting fronts. The emergence of air transport as an important cargo carrier in 1943 was one of the most significant developments in aviation.

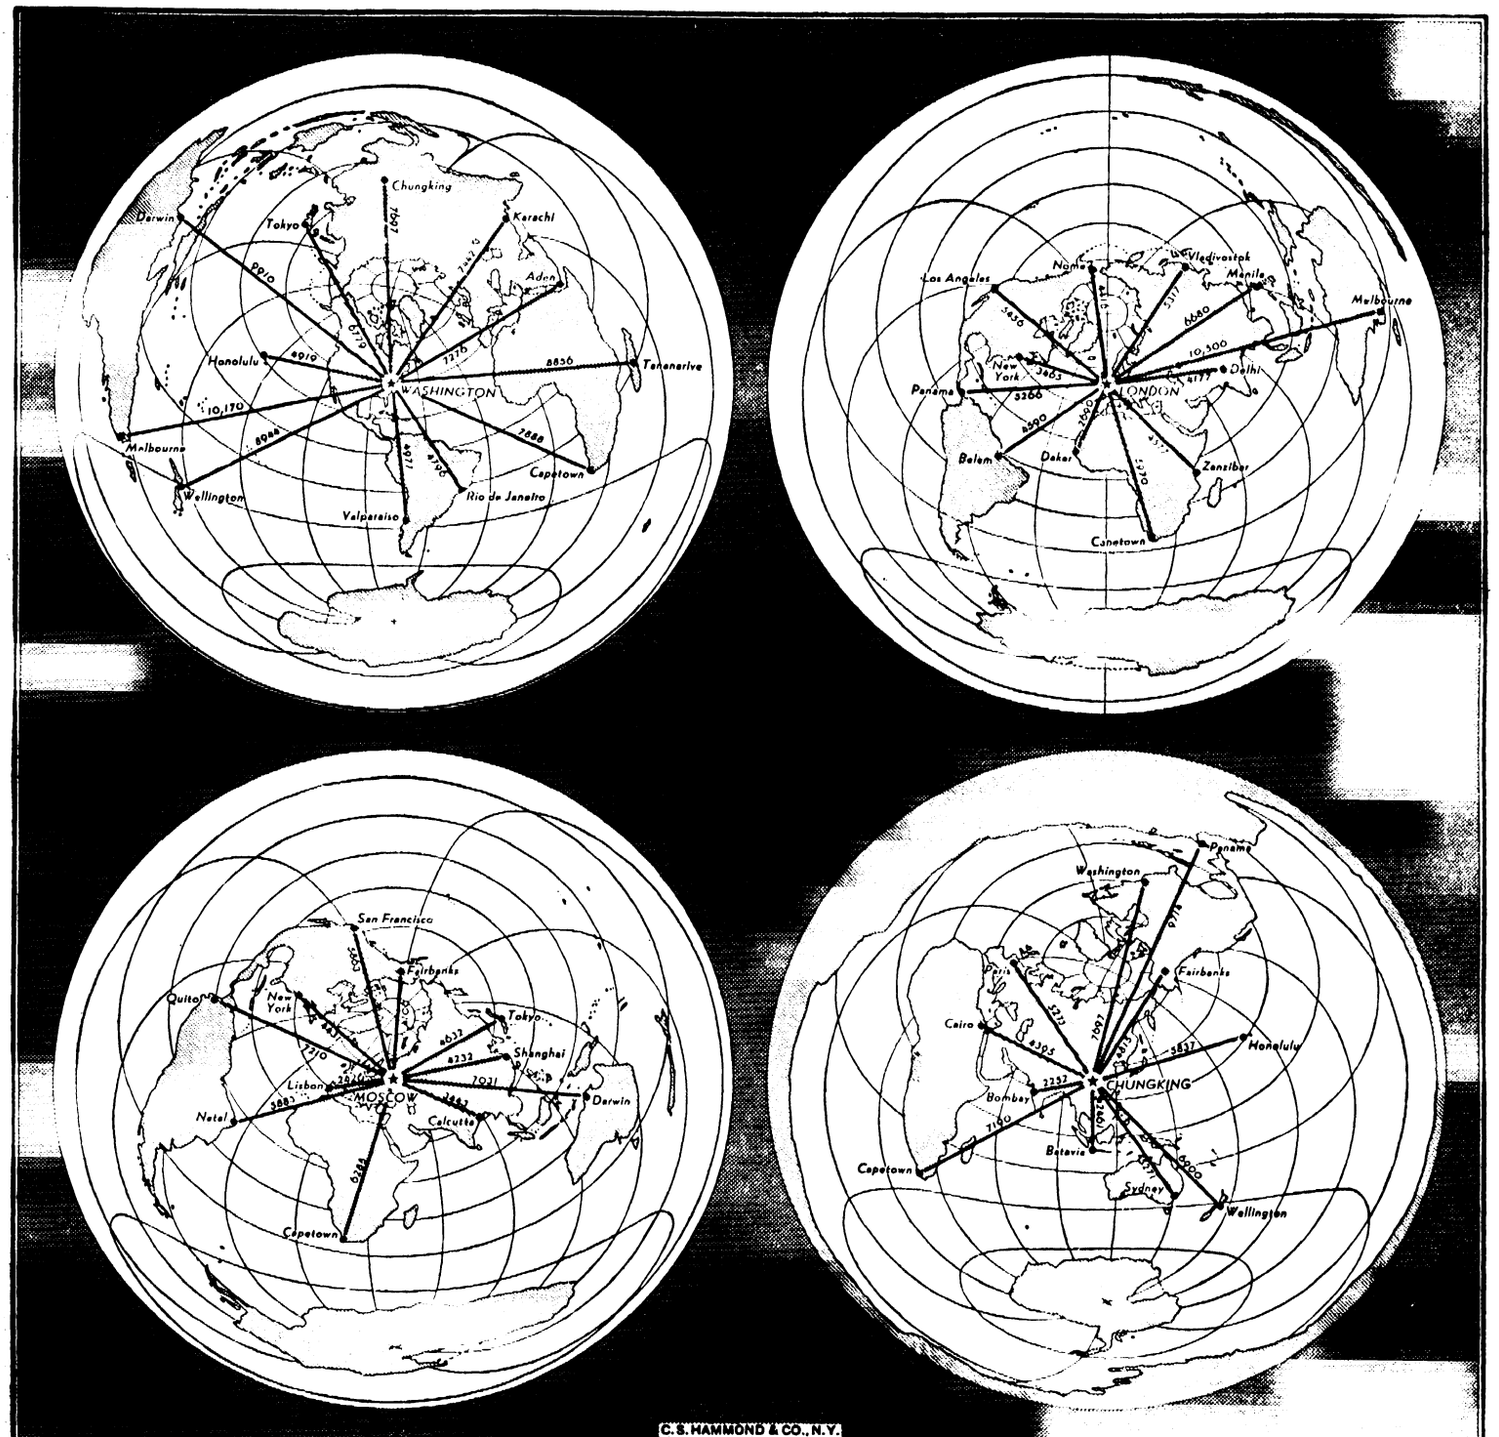
Cargo Operations.—Movement of imported materials into the U.S. by air during 1943 amounted to approximately 41,000,000 lb., valued at $116,209,000, or 5.83% of the total value of ocean cargo. The average unit shipped by air was valued at $2.85 per pound, or 81 times the average unit value of 3½ cents per pound for ship cargo. In terms of volume, the total shipments of 41,000,000 lb. represented .072% of the total 25,150,000 long-ton water-borne volume.

For each long ton shipped to the U.S. on the seas, 1.67 lb. of cargo were moved by air. On the average, during 1943, each unit of air cargo was 1,381 times smaller, 81 times as valuable, about 20 times as safe and moved more than 6 times as fast as cargo on ocean vessels.

U.S. foreign and domestic air lines, along with the army's air transport command and the naval air transport service, kept moving shipments of vital materials without which many war factories might have had to close down if air transport had not been available. Typical of such critical materials were mica, quartz crystals, industrial diamonds, tantalite, beryl and rare drugs. Some of these—tantalite, for example—are so rare that a nation at war could ill afford to have even the smallest shipment sunk at sea.

Summary of U.S. Air-line Activities.—The 18 domestic air lines and 3 international air lines of the U.S. in 1943 had more than doubled the volume of cargo carried in the last prewar year, 1941, and carried only 25% fewer passengers. This was accomplished with slightly more than half the equipment possessed by commercial air lines before the U.S. entered the war on Dec. 7, 1941. It was made possible by elimination of nonessential stops, standardization and better utilization of equipment, and a passenger priorities system which fully booked each plane for each flight.

The air lines' activities fell into two main categories: (a) transport operations, training programs, modification and maintenance of military equipment through contract with the army and navy and (b) continued operation of commercial air transport services.



In 1943 the world system of U.S. airways, in which military operations and commercial implications for the future are inextricably intermingled, passed the pioneer stage. Remote coral atolls and jungle rivers became seaplane bases. Airfields and air navigation aids were strung through tropical jungles, across desert wastes and uninhabited arctic regions. At the end of the year, almost any spot on the globe was within 60 hours' flying time of any sizable airport in the U.S.

Safety was a keynote in the vast expansion program, because of the extreme importance of the personnel and supplies carried. The air lines, in co-operation with the armed services, worked out many new devices and techniques to increase the safety of flight operations and improved existing ones. Most of the new developments remained on the secret list, but aviation authorities declared that their application to postwar aviation would bring about revolutionary changes.

International Air Transport.—Pan American Airways system in 1943 retained its leadership as the greatest international air line in the world.

With a fleet of 150 aircraft in operation at the end of 1943, Pan American Airways and its affiliate, Pan American-Grace Airways, had flown a total of 65,346,000 mi. as compared with 43,939,744 mi. in 1942. The number of passengers carried was nearly double the figure for 1941: 606,700 as against 391,013; passenger-miles flown totalled 475,470,000 in 1943 as compared with 228,630,621 in 1941. In 1943 the system carried 49,345,000 lb. of cargo, making a total of 72,735,000 ton-miles. A mail load of 14,465,400 lb. in 1943 was more than four times the 3,489,619 lb. carried in 1941.

In addition, a division of P.A.A. set up to carry out operations for the AAF's air transport command logged enough flying hours during 1943 to girdle the globe at the equator 4,560 times at 200 m.p.h. This division's services were scheduled over 15,570 foreign route miles to some 70 different locations in 31 countries and colonies on three continents. Its operations increased nearly five times over those of the preceding year. This division operated the largest fleet of aircraft in the system, flying 1,250,000 mi. a month carrying overseas cargo at the rate of 3,500,000 ton-miles every 30 days. The division had 117 flight crews of which

A straight line on the map connecting the centre spot with any other spot on the map is the shortest distance between the two points, a great circle route

76 were expert in four-engine aircraft operation.

In Alaska, Pan American operations for the naval air transport service, and on civil routes, reached new levels in 1943 as military operations turned from the defensive to the offensive to drive the Japanese out of the strategic Aleutians. July was the climactic month in the campaign. During that month P.A.A. flew 477,440 plane-miles and 81,657 cargo ton-miles as compared with 88,190 plane-miles and 4,113 cargo ton-miles during the same month of the preceding year.

From Miami, over seven different routes to Mexico, the West Indies, the Caribbean area and the north and east coasts of South America to Buenos Aires, P.A.A.'s eastern division flew 12,146,294 plane-miles in 1943, an increase of 35% over the preceding year.

More than 125,000 passengers were flown 128,818,699 passenger-miles, which represented a 26% increase over 1942.

Early in 1943 the Civil Aeronautics board granted Pan American Airways a three-year temporary certificate to operate a new service between New Orleans, La., and Guatemala City in Central America, providing an additional connection with its network of Latin-American routes. The 1,075-mi. flight across the Gulf of Mexico was made in Boeing Stratoliners with accommodations

for 33 passengers in pressurized cabins for high-altitude flying. This link reduced the time of travel from Chicago to the Canal Zone to approximately 21 hr.

American Export Airlines expanded its transoceanic operations during 1943. In addition to its commercial operation from New York to Foynes, Ire., it conducted considerable contract work for the armed services.

During 1943 the total length of civil aviation routes in Mexico had more than doubled over the preceding year. The expansion was due in part to wartime curtailment of water-borne traffic. Chicle, mineral concentrates and coffee comprised the chief cargo items flown.

British Overseas Airways, Great Britain's government-owned international commercial air line, continued and expanded its world-wide operations during 1943. Most important services operated were between Great Britain and America via Lisbon and Bermuda, and also via Foynes, Ire., and Canada. A regular Britain-to-Moscow service was inaugurated following a circuitous route via Lisbon, North Africa, Cairo, Iraq, Iran, Astrakhan and Kuibyshev. Operations also were conducted to India and across the South Atlantic, and to other points not disclosed for reasons of military secrecy.

Swedish A.B.A. air lines continued international operations chiefly to Britain and to Germany. The Netherlands K.L.M. lines maintained operations in the Caribbean area. International air operations of the axis nations, which had been fairly extensive at the start of the war, were virtually nonexistent in 1943. Germans continued operating commercial schedules to Lisbon, Port.

Civil Air Transport Operations Statistics.—Total miles flown by U.S. domestic air lines in 1943—93,122,000—was considerably under the 110,102,860 total for 1942. However, the passenger-load factor increased from 72.15 in 1942 to 91.4 in 1943, and the air lines actually carried more traffic than in the preceding year.

The number of aircraft in operation was 197, an increase of 18 over 1942. Total passenger-miles flown in 1943 was approximately 1,570,000,000, a 6% increase over the 1,481,976,329 total for 1942. Express pound-miles flown in 1943 totalled about 29,400,000,000 as compared with 23,435,208,925 pound-miles flown in 1942, an increase of 25%. Air-mail pound-miles flown in 1943 were approximately 66,290,000,000, as compared with 40,096,554,805 pound-miles in 1942, an increase of 65%.

Total passengers carried in 1943 were approximately 3,105,000, compared with 3,349,134 in 1942. Passenger fatalities numbered 23 in 1943 as against 55 in 1942. Passenger-miles flown per passenger fatality in 1943 were about 65,446,000, compared with 26,945,024 in 1942.

Gross income of domestic air lines reached a new high of $120,000,000, as compared with $108,000,000 for 1942.

Summary of Civil Aviation Development.—Although the Civil Aeronautics administration remained a civilian agency in 1943, most of its activities were devoted to projects serving the armed forces. The CAA conducted a $400,000,000 defense airport program. Landing fields suitable for transport aircraft were increased from 660 to 940 in 1943; total number of airports in all categories was approximately 3,000 at the end of the year.

There were 16,277,027 aircraft operations reported to CAA centres which controlled traffic on the federal airways, compared with 9,208,776 such operations in 1942.

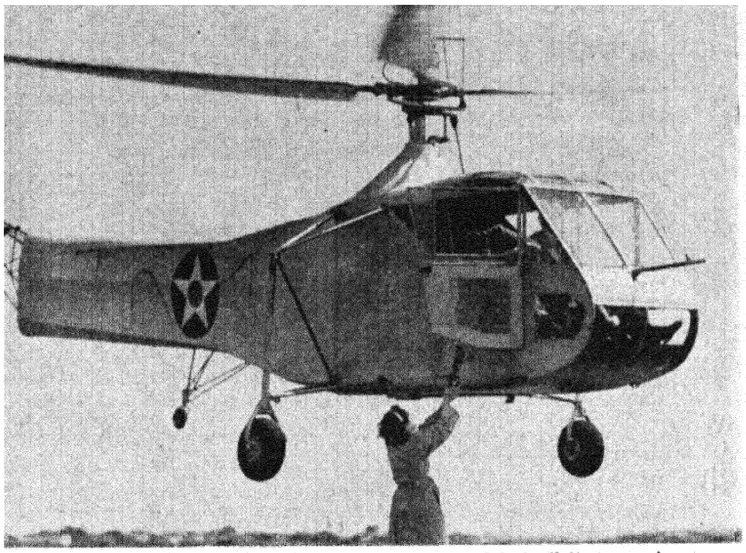
During 1943 more than 10,000 transports and noncombat planes were inspected or flight-tested (sometimes both) at factories by CAA representatives. Airmen examined for certificates of competency included more than 18,000 would-be private pilots, 15,000 commercial pilots, 9,500 flight instructors and 9,000 engine mechanics.

The war training service branch of the CAA gave approximately 250,000 flight courses to army and navy cadets in 1943, as compared with 70,000 in 1942. The number of pilots holding CAA certificates increased from 110,510 in 1942 to 124,050 in 1943.

U.S. Production Achievement.—The American aircraft industry in 1943 set an all-time world's record in building 667,000,000 lb. of military aeroplanes, exclusive of engines and equipment, which was nearly 2½ times the weight produced in 1942 and approximately 8 times 1941 production. Although 85,946 military planes were produced in 1943, the numerical total does not reflect the magnitude of the achievement because the average weight of each plane produced in that year was nearly double the average weight of planes produced in 1941. This was due not only to the trend toward larger and heavier planes, but also to the greater proportion of heavy bombers and transports as compared with fighters and trainers. Total poundage produced in the month of Dec. 1943 alone equalled that of the entire year of 1941.

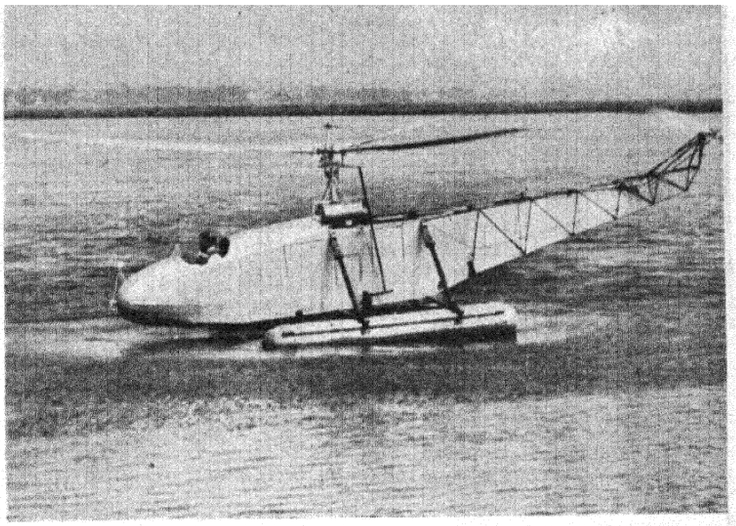
The dollar value of airframes, engines and propellers produced in 1943 was estimated at $11,000,000,000 as compared with the 1942 value of $5,000,000,000 and the 1941 value of $1,750,000,000. These figures do not represent the total value of all aviation production, however, because many items such as armament, instruments and other equipment are not included.

Employees engaged in aircraft production at the end of 1943 totalled approximately 2,000,000.



Helicopter Development.—No less than six different helicopter designs were flying in the U.S. in 1943 and scores of others were under development. At the end of the year it was estimated that more than 100 different companies were engaged in development or manufacture of helicopters.

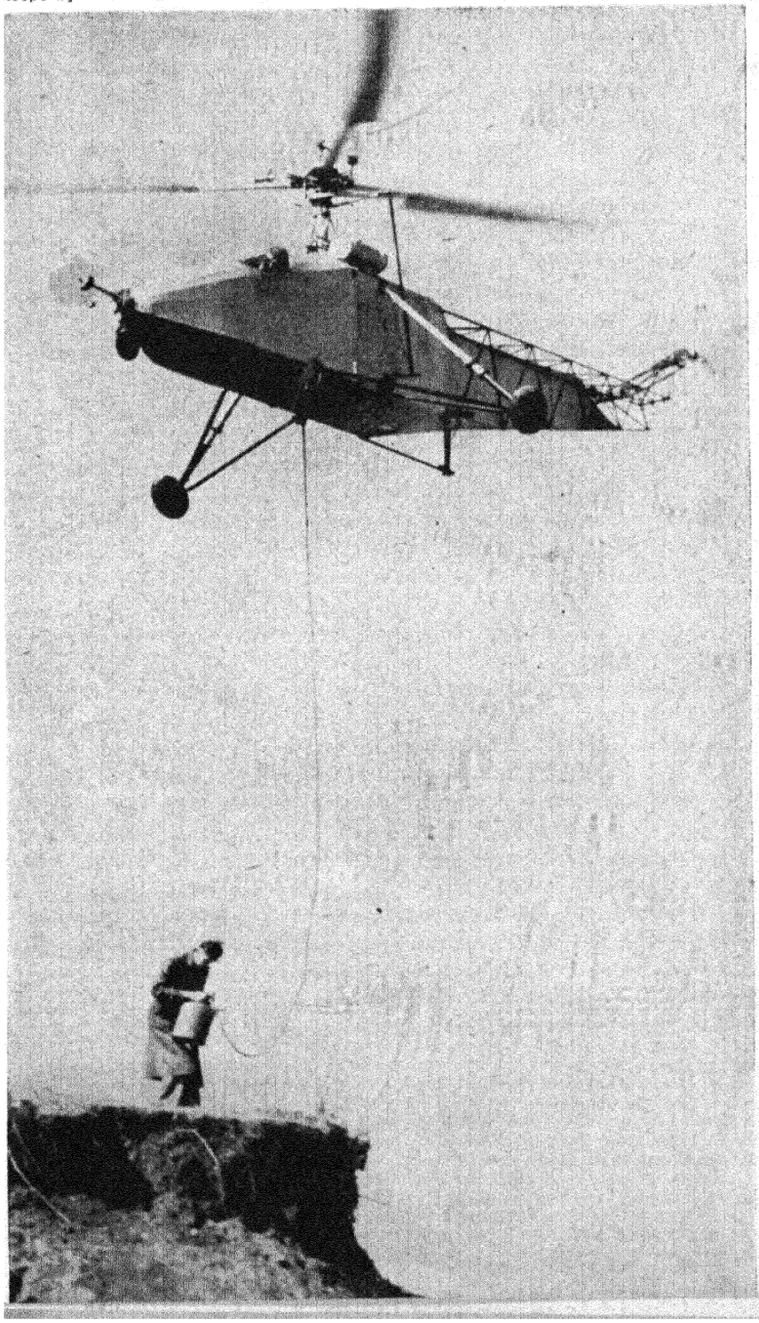
Such was the confidence in the helicopter's successful development in the immediate future that scores of companies and individuals filed applications with the Civil Aeronautics board, seeking authority to operate helicopter routes for the transportation of passengers, mail and express over routes throughout the U.S. totalling more than 100,000 mi. The applicants included existing commercial air lines, proposed new air-line companies, bus, truck, railroad and steamship operators and private individuals.

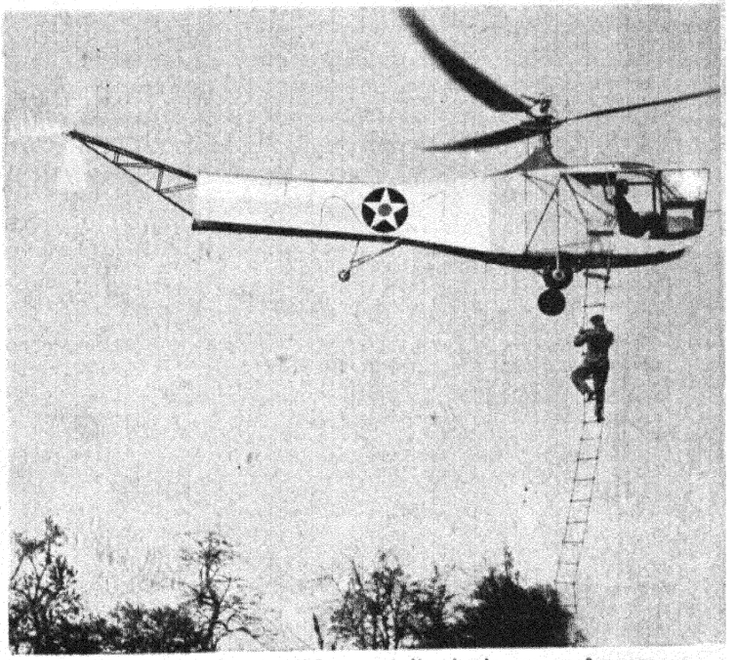


Although helicopter production for other than experimental purposes was limited to the military, competent authorities at the end of 1943 predicted that this form of aircraft had reached a satisfactory stage of development which would permit the construction of safe, efficient vehicles with a capacity of 12 to 14 passengers, which would be satisfactory for operation in shuttle, or bus-type, services.

The helicopter designed by Igor I. Sikorsky and built by Sikorsky division of United Aircraft corporation was being produced in considerable numbers for use by the army and navy. The Sikorsky design incorporates a single large three-blade rotor revolving in a horizontal plane above the fuselage of the craft, with a much smaller auxiliary tail rotor revolving in a vertical plane, which counteracts the torque induced by the main motor and is used also for steering. The engine is located in the fuselage under the main motor shaft, which it drives through suitable gearing and clutch mechanism. Provision for two occupants seated side by side is made in the enclosed cabin which forms the front of the fuselage.

Although most of the projects under way followed the basic arrangement described for the Sikorsky helicopter, many quite different designs also were being tested and flown. The Platt-LePage helicopter design utilized two rotors mounted on outriggers projecting from the sides of the craft a sufficient distance





ICKING UP A PACKAGE as a helicopter hovers several feet off the ground

OW A HELICOPTER can drop supplies to persons marooned in spots inaccessible xcept by air. Rescue of lost persons is also possible by means of a rope ladder

PASSENGER climbing aboard a U.S. army helicopter by means of a rope ladder dropped from the craft, which remains practically stationary in the air

THE HELICOPTER gave promise in 1943 of revolutionizing postwar civil aviation and providing a means of mass private transportation by air. Here a Sikorsky VS-300 is landing on a small flat roof

to permit their rotation in the same plane without interference. In this design the rotors revolved in opposite directions, thus equalizing the torque and eliminating the necessity for an auxiliary tail rotor. Steering was accomplished by causing one rotor to advance faster than the other.

Another design employed two rotors, one above the other, rotating in opposite directions around the same vertical axis. This was designed by the late Dr. George de Bothezat and manufactured by the Helicopter Corporation of America. Designated the GB-5, a most unusual feature of its design was the location of the engine between the counter-rotating blades and outside the cabin of the helicopter.

Again, since the two rotors revolved in opposite directions, thus cancelling out the torque, there was no need for an auxiliary tail rotor. Steering was accomplished by varying the pitch of one set of blades from the pitch of the blades on the other rotor, thus deliberately inducing torque which turned the cabin of the craft in the desired direction. This craft was test flown in 1943.

Late in 1943, a single-place 1,000-lb. helicopter designed and built by the P-V Engineering Forum was successfully flown. The arrangement and method of control was virtually the same as that described for the Sikorsky helicopter. It possessed a cruising speed of about 55 m.p.h. and a top speed of 90-100 m.p.h. Aviation, Military: *see* AIR FORCES OF THE WORLD; GLIDING; WORLD WAR II.

Avila Camacho, Manuel (1897–), president of Mexico, was born at Teziutlan in the state of Puebla on April 24. After completing a course of commercial studies in his native town, he joined the successful revolution against Victoriano Huerta in 1914 and advanced to the rank of general of division. In the cabinet of President Rodriguez he was minister of war and navy. President Cárdenas later appointed him secretary of national defense and personally selected him as successor to the presidency. He was elected president July 7, 1940, by 2,476,641 votes to 151,101 for his opponent, Gen. Juan Andreu Almazán, according to tabulations of the Mexican congress. The new president was inaugurated Dec. 1, 1940.

During 1941 he negotiated a settlement of the oil-expropriation controversy with the United States. He consistently stressed hemispheric solidarity in defense and on May 22, 1942, three weeks after a German submarine had sunk a Mexican ship, Avila Camacho called for war against the axis. The congress unanimously approved his demand and on June 2 he signed the declaration of war against Germany, Italy and Japan (which was made retroactive to May 22) and Mexico joined the United Nations. A middle-of-the-roader keenly concerned with industrial development, Avila Camacho headed a vigorous program of Mexican war industry development, which supplied many minerals and other raw materials to U.S. factories during 1942 and 1943. Bacon. The statistics of bacon production in the United States were not separated from pork in general since the output of bacon varies in accordance with the changing cutting and trimming practices of the meat packers. These in turn are adjusted to the type of hog that predominates in the market. In 1943, when farmers were feeding hogs to the heavier weights because of the favourable price of pork compared to corn, the proportion of fat ran very heavy and led to a very fat type of bacon. This type was not desired for the military forces but lard and fat meats were wanted by the soviet army under lend-lease. The preferences of the British for a lean bacon, and the Russian desire for lard led to the trimming of meat cuts to suit the particular market to be served. The demand for bacon is fairly constant and varies little from month to month or year to year. With heavy pork production there is therefore no danger of shortages since in the general supply of hogs there is always enough of the bacon type to supply the demands. The price of bacon fluctuates with the price of pork in general and has no special market price of its own. (*See* also HOGS; MEAT.) (J. C. Ms.)

Bacteriology. Two classes of antibacterial therapeutic agents of direct application to wartime needs were being intensively investigated; the sulfonamides and the antibiotic substances derived from bacteria, actinomycetes and moulds.

The discovery and compounding of the various sulfonamides had been the work of chemists. The isolation of antibiotic substances, the testing of their activity and the solution of their modes of action against various bacteria were in the field of biochemical bacteriology and mycology.

Experimental medicine and clinical observation demonstrated the therapeutic usefulness of the sulfonamides and began to exploit the antibiotic substances.

The sulfonamides are a group of chemically related compounds but the antibiotic substances are less homogeneous, falling into seven chemical groups according to Selman A. Waksman: "1. lipoid bodies: pyocyanase and clavicin; 2. pigments: pyocyanin, prodigiosin, chrysogenin, chlororaphin, toxoflavin and actinomycin; 3. polypeptides: gramicidin, tyrocidine, lysozyme and actinomycetin; 4. sulphur-bearing compounds: gliotoxin; 5. quinonelike compounds: citrinin, penicillic acid, fumigatin, possibly penicillin: 6. organic bases: streptothricin; 7. other agents: fumigacin, etc." Their action may be bacteriostatic, bactericidal or bacteriolytic. Of 200 species of fungi (mostly of *Penicillium* and *Aspergillus*) examined by W. H. Wilkins and G. C. M. Harris, 64 showed antibacterial activity.

Although the sulfonamides and the antibiotic substances of microbial origin differ as to origin and chemical nature, they were found to show some resemblance in their modes of action on bacterial cells, *i.e.*, by interference with essential metabolic processes. Many papers on bacterial metabolism appeared, among them an excellent review on "Factors Influencing the Enzymic Activities of Bacteria" by Ernest Frederick Gale. The reader is also referred to the address by Waksman on "The Microbe as a Biological System" in which it was stated of the antibiotic substances: "1. some act primarily upon bacteria, and others upon fungi; 2. some influence cell division, others affect respiration, still others interfere with the utilization of certain metabolites; 3. they are selective in their action, some being capable of acting upon a great number of organisms, and others upon only very few; 4. some act primarily *in vitro* and others act also *in vivo;* 5. they vary in their toxic effect upon the animal body, and in reactions upon the tissues; 6. some are hemolytic and others not; 7. some are water-soluble and others are only alcohol-soluble. Because of these properties, some can be used for general treatment, and others have only a local application." (*See* also EPIDEMICS AND PUBLIC HEALTH CONTROL.)

Badminton. With David Guthrie Freeman, four-times national champion, in the army medical corps, badminton became more of a recreational than a competitive sport during 1943. No national championships were held, and what title play existed was restricted to sectional tournaments.

The middle Atlantic doubles tourney highlighted badminton in the east, with Carl Loveday and Cheever Lockwood of Montclair, N.J., winning the title with a 15–11, 15–10 decision over Frank Jasensky and Frank Williamson, New Rochelle, N.Y., in the final. The women's middle Atlantic championship went to Mrs. Roy Bergman and Helen Gibson of Westport, Conn., who defeated Mrs. Kenneth Davidson and Theresa Bellizzi, New Rochelle, in the final, 15–6, 15–1.

Richard Casey of St. Louis captured the midwest singles championship, downing Joe Tiberi of Chicago in the windup, 15–12, 15–2. Pearl Peterson of Detroit successfully defended her women's singles title with an 11–1, 11–4 victory over Eleanor Coambs of Chicago. Dean Foote and Jack Riday of West Allis, Wis., repeated as men's doubles champions, and Miss Coambs and Thelma Burdick of Chicago topped the women's doubles.

For southern California Helen Noble and LeRoy Erikson, both of Pasadena, were district singles champions. The New York metropolitan titles were won by Corporal Stig Larson and Theresa Bellizzi, both of New Rochelle. (M. P. W.)

Badoglio, Pietro (1871–), Italian army officer, was born at Grazzano Monferrato, Piedmont, on Sept. 28. He took part in the Eritrea campaign, 1896–97, saw service in World War I in 1915, and emerged as a general after the war ended in 1918. Elected a senator in 1919, he went to Brazil as ambassador in 1924 and returned to Rome in 1925 to assume the post of chief of the army general staff. He was created Marchese del Sabotino, 1928, was governor general of Libya, 1928–33. He participated in the Ethiopian campaign and was named viceroy of Abyssinia, 1936. He later resigned from the latter office and was created duke of Addis Ababa. When Mussolini declared war against the Allies in June 1940, Marshal Badoglio was in command of the Italian armies. While allegedly opposed to the Italian invasion of Greece in Oct. 1941, he nevertheless was made the scapegoat for its initial failures and resigned as chief of the general staff "at his own request," Dec. 6, 1941. For the next 18 months Badoglio shunned the limelight until his dramatic reappearance July 25, 1943. After a stormy cabinet session, Mussolini was ousted as premier and Badoglio was made his successor. On Sept. 3 the Italian marshal concluded a secret military armistice with Gen. Eisenhower and five days later, Sept. 8, 1943, Badoglio told the Italian people that he had signed unconditional surrender terms laid down by the Allies. The following day, Badoglio, in a letter to Hitler, explained that Italy was compelled to surrender to "avoid total ruin." After his installation as premier, Badoglio dissolved the fascist party, released many anti-fascist prisoners. On Oct. 13 he declared war against Germany and joined the Allies. Although he stubbornly refused to foreswear loyalty to King Victor Emmanuel III, the Italian general did promise, Oct. 20, that he would restore constitutional rule and step down as premier once Italy was liberated.

Bahamas. A group of some 3,000 islands, rocks and keys, north and northeast of Cuba. About 20 of the islands are inhabited, permanently or intermittently. Total area: 4,375 sq.mi.; pop. (1940 est.) 66,219 (1931 census: 59,828), with 15% white and the remainder Negro and mulatto. Capital, Nassau (pop. 19,756). The Bahamas form a British colony, with an appointed governor (in 1943, H.R.H. the Duke of Windsor) and legislative council, and an elected assembly.

History.—The war continued to affect the Bahamas during 1943, although financial conditions remained fairly satisfactory. Price control had been established in Dec. 1942; rationing of essential foodstuffs became necessary in July 1943. The prospective completion of war projects at Nassau caused the government to set up a special Out Islands department, designed to formulate work projects which would draw unemployed workers away from the capital. An arrangement made in May for the transportation of up to 6,000 Bahama labourers to Florida to fill labour demands there likewise helped with unemployment.

In July Sir Harry Oakes, the richest resident of the islands, was murdered; his son-in-law, Alfred de Marigny, was accused of the crime but won an acquittal in December.

Education.—In 1940 schools numbered 167 (46 denominational and private), with a total enrolment of 15,787 students.

Finance.—The monetary unit is the pound sterling (value in 1943 $4.03½ U.S.) Government revenues (1942) were estimated at £394,690; expenditures, £439,889.

Trade and Communication.—Trade figures for 1943 were not available; imports for 1942 totalled $6,129,000 (1941: $5,183,000), exports (exclusive of re-exports) $778,000 (1940: $528,000). The principal imports are foodstuffs and manufactures, largely from the United States, Canada and the United Kingdom. Exports of importance in 1943 were tomatoes (85,000 lugs, to

THE DUKE OF WINDSOR visited a camp of his subjects at Swedesboro, N.J., in May 1943. The Negroes had been sent from the Bahamas to help harvest an asparagus crop

Canada), crawfish (about 1,250,000 lb.) and other marine products, straw and shellwork, and wood products.

External communication is by air and boat, with schedules subject to war conditions. New Providence possesses good highways, and roads are under construction on other islands.

Resources.—The tourist trade is normally the most important single item in the colony's economy (tourist expenditure in 1941 est. $4,000,000), but was unimportant in 1943. Sponging, usually second in importance, remained practically suspended as in 1941 and 1942 because of disease in the sponge beds. To replace these industries, the Bahamas turned to sea food exports, sisal development (342 tons produced in 1941), spice, and straw and shellwork. The perfume industry declined due to lack of essential materials. (*See* also WEST INDIES, BRITISH.)

Baltimore. Seventh largest city of the United States, Baltimore, Md. had a population by the 1940 federal census of 859,100. White population 692,705, non-white 166,395, mainly Negro, constituting 19.4% of total. Foreign-born white, 60,969, 7.1% of total. Area, 78.5 sq.mi., plus 13.35 sq.mi. of water.

Mayor Theodore R. McKeldin, Republican, elected May 4, 1943, took office May 18. His vote, 77,567, constituted a majority of 20,275 over the Democratic candidate, former Mayor Howard W. Jackson, running for a 5th term. McKeldin was the first Republican mayor elected since 1927. He received the largest majority ever given a Republican. Howard E. Crook, Democrat, was elected city comptroller. The council president, Thomas E. Conlon, Democrat, died in Oct., 1943, and the vacancy was filled by C. Markland Kelly. Democrats retained a solid membership in the city council during 1943.

Baltimore had a continued boom in 1943 as an important defense area, but at a less accelerated rate than in 1942. It continued to be a leading shipbuilding and plane manufacturing centre, and became a major producing centre of high octane gasoline with the erection of a $14,000,000 catalytic cracker at the Baltimore refining plant of the Standard Oil Co. of N.J.

Appropriations from tax levy were $56,498,601.71. Total appropriations, including approved expenditures from existing and tentative loans, were $68,540,157.71. The total taxable basis was $1,664,037,410. The tax rate, $2.85 per $100, increased 20 cents. Gross funded debt as of Aug. 31, 1943 was $161,727,000; net general debt for 1943, $84,547,919.45. A bond issue of $12,500,000 was authorized for water supply during 1943.

(C. B. S.)

Bananas. The exact amount of imports of bananas in 1943 was withheld as confidential information by the U.S. government. General trade sources indicated that imports were less than half the normal amounts. The scarcity of the fruit in the retail markets was sufficient proof of the scarcity. The problem of the banana trade continued to be transportation. Since about 80% of the imports were brought in by boat and particularly by the special banana-boats of the United Fruit company, the loss of these ships, which were taken over by the government, immediately stopped the normal trade. There were no railroad facilities to most of the banana areas except Mexico. The banana growers in Latin America were in great distress notwithstanding the aid given by the fruit companies and local governments. The fruit companies experimented with dehydration and other methods of processing bananas without much success. The consumer prefers the natural fruit and the prospect of developing a new form in which to market bananas seemed remote in 1943. The efforts to shift the banana land to other uses was proceeding slowly in Central America since the natives were being trained in the growing of fibre plants such as abacá and hemp. These natives were hesitant to change, preferring to wait for the banana industry to recover. (J. C. Ms.)

Bankers Association, American: *see* AMERICAN BANKERS ASSOCIATION.

Bank for International Settlements. Though its functioning as a medium for financing international trade had been more or less stifled by the war, the Bank for International Settlements, located at Basle, Switzerland, continued in 1943 to render valuable service as banker for international Red Cross organizations. Also it continued to receive the co-operation of central banks and monetary institutions throughout the world.

Though the intensified warfare in Europe and the invasion of Italy by Allied forces placed a greater diplomatic strain upon the relationship of the bank to the nations involved, its board of directors carefully avoided implication in any transaction that might involve its policy of adherence to strict neutrality or give rise to a suspicion of serving the financial interests of one country to the disadvantage of another.

The balance sheet total at the end of the fiscal year, March 31, 1943, showed a gain of 6,736,527 Swiss gold francs, standing at 483,382,662 Swiss gold francs compared with 476,646,135 the previous year. The calendar year 1943 started with a balance of 479,214,390 Swiss gold francs and rose to a high of 486,491,650 on June 30. The balance sheet total on Sept. 30, 1943, stood at 484,371,943 Swiss gold francs.

A notable change in the asset account was the increase in "gold in bars" item, which stood at 80,066,994 Swiss gold francs on Sept. 30, 1943, compared with 42,082,396 on March 31, 1942. Among the liability items, short term and sight deposits in various currencies declined 5,401,077 Swiss gold francs at the end of the 1943 fiscal year compared with the previous year's close, but short term and sight deposits in gold showed an increase of 10,666,844 Swiss gold francs. Significant under "reserves" items was the disappearance, as of June 1943, of the dividend reserve fund, which prior to the 1943 fiscal year had been carried at more than 4,000,000 Swiss gold francs, but which in June 1942, had dropped to 1,626,940 Swiss gold francs.

In the distribution of its assets the bank paid particular attention to the maintenance of full liquidity in the markets where it had its commitments.

Banking. A new peak in war production in 1943 found banking in the U.S. ready to assume its full responsibilities in the form of loans to war industries, purchase of government securities and assistance in the distribution of government bonds among individual and institutional purchasers. Deposits and investments increased to new high levels for all time, while the total of loans fell off slightly because of reduced

U. S. Banking, Deposits, Loans and Investments, 1942 and 1943
Total (in millions of dollars)

All banks	Deposits	Loans	Investments
1942—14,775	72,419	25,081	38,928
1943—14,618	96,329	22,241	65,640
Member banks			
1942—6,647	53,434	16,928	29,872
1943—6,703	73,465	14,823	52,332

civilian requirements, as shown on page 94 in the comparative table for years ending June 30.

The member banks of the federal reserve system (*q.v.*) assumed an increasing importance in the financing of the war, as is evidenced in the foregoing table. Excess reserves of member banks continued the decline of 1942, approaching the vanishing point in New York city and Chicago and reaching $1,020,000,000 for the entire country in July, the lowest point since 1937. This decline accompanied the remarkable growth in deposits, due to the absorption by the banking system of over $22,000,000,000 of additional U.S. government securities, and the continued growth in money in circulation, which stood at a record high of over $20,000,000,000 at the end of 1943—an increase of nearly $5,000,000,000.

The pressure on excess reserves was relieved by legislation which permitted banks to hold in war loan accounts the proceeds of U.S. government securities purchased for their own account or the account of customers without providing a reserve or paying Federal Deposit Insurance assessments on such deposits. Member banks were enabled to keep more fully invested by a practice inaugurated by the treasury of allotting in full at a fixed price to yield ⅜% all subscriptions to treasury bills in amounts not exceeding $100,000 while the Federal Reserve banks agreed to purchase all treasury bills offered at ⅜%, giving the purchaser an option to repurchase at any time prior to maturity at the same rate. Open market operations of the Federal Reserve banks also relieved the shortage of member bank reserves, their holdings of government securities reaching an all-time high of nearly $11,000,000,000 in Dec. 1943.

Although loans declined for 1943, a steady increase in volume marked the trend toward the year's end. Government guaranteed V-Loans were made available on a broader basis, to assure war contractors that their working capital invested in war production would not be frozen on contract terminations. Interest rates on loans were steady, with a rising tendency toward the end of the year. Bank earnings were aided by a substantial increase in the yield of short- and medium-term government securities, while long-term rates remained steady, aided by the support of the Federal Reserve banks. In addition to investing in large amounts of government bonds, the U.S. banks co-operated with investment bankers, brokers and others in intensive campaigns for the sale of government bonds to individuals, culminating in the Third War Loan drive in September, in which $18,943,000,000 in bonds were sold to nonbank investors. (See *Investment Banking*, below.)

Bank earnings increased substantially during 1943, although they were partly offset by increases in expenses, including taxes and salaries. For the first time in history, return on securities exceeded interest and discount on loans, because of expanded holdings of government securities. Service charges and trust department earnings again contributed substantially. Net profits were higher but dividends were down slightly, reflecting the need for building up surplus and capital funds in keeping with enlarged deposit liabilities. The war caused further drains on bank personnel, and in many banks women employees numbered more than half the clerical force. The banks organized and operated "ration banking" to facilitate the clearance of ration coupons between retailers and suppliers. (*See* also BUSINESS REVIEW; CONSUMER CREDIT; LAW; RATIONING.)

Canada.—Banking continued to serve the war needs of Canada during 1943, as production for war purposes resulted in an unprecedented increase in the industrialization of the dominion. There was a marked expansion in banking accounts, and deposits of the ten chartered banks increased nearly $500,000,000 to $4,085,000,000 on Sept. 30, 1943. The volume of loans and discounts fluctuated in a narrow range, standing at $1,045,000,000 on that date. Holdings of securities increased by $502,000,000 to a total of $2,881,000,000, reflecting added purchases of dominion securities. Canadian banks were a large factor in the distribution of government securities to the public, which provided over 81% of funds borrowed, leaving only 18.5% to be absorbed by the banking system during the year ended Aug. 31, 1943.

Earnings were supplemented by new service charges, while bank taxation increased, with a wartime excess profits tax of 100% imposed, based on 1936–39 average earnings. More than 6,800 men and 150 women bank employees had enlisted in the armed forces. Many women were added to replace the men in the service, so that over half the employees were women. During the war, more than 200 branches had been closed to save manpower. On March 1 Canadian banks began to handle wartime consumer ration coupons for dealers in foodstuffs. The 3,200 Canadian branch banks accepted ration coupon deposits and handled coupon checks and ration transfers. They also continued to act for the government as licensed dealers in foreign exchange under the Foreign Exchange Control board

The Bank of Canada increased its holdings of government securities by nearly $240,000,000 to $1,221,000,000 on Oct. 31, 1943. The note issue of the Bank of Canada rose to $836,000,000, an increase of $170,000,000, while the chartered bank note circulation declined from $69,000,000 to $46,000,000, as required by law.

Great Britain.—Banking in the United Kingdom continued to be entirely subject to the influence of total war. The 11 London clearing banks reported an increase in holdings of government obligations of £357,000,000 to £2,205,000,000 on Sept. 30, 1943, while loans were off somewhat to £741,000,000. Deposit liabilities reached a new high of £3,737,000,000, up more than £313,000,000 for the year. Interest rates remained stable under the control of government authorities. Note circulation of the Bank of England increased over £128,000,000 to £998,500,000 on Oct. 27. Due to the shortage of manpower, nonessential activities of all banks were reduced to a minimum. (*See* also BANK OF ENGLAND.)

Europe.—Germany continued to dominate banking on the continent, although gradually losing grip in Italy, which was invaded by the United Nations. Its influence also waned in neutral Spain and Switzerland as success attended the arms of the Allies. The deposits of the Reichsbank increased from 2,887,000,000 reichsmarks to 5,601,000,000 during the year ended Sept. 30, 1943. Note circulation increased from 22,600,000,000 reichsmarks to 30,099,000,000, not including a great volume of special paper marks used in occupied countries. There was a large expansion in treasury bill holdings from 24,641,000,000 reichsmarks to 35,010,000,000.

Note circulation of the Bank of France increased from 323,494,000,000 francs to 440,291,000,000, and government advances for German occupation costs increased from 180,999,000,000 francs to 271,371,000,000 at July 29, 1943. (*See* also BANK FOR INTERNATIONAL SETTLEMENTS.)

Investment Banking.—U.S. investment markets were completely dominated by government financing for the war, which raised the total national debt from $92,904,000,000 to $165,047,000,000 in the year ended Oct. 31, 1943. New corporate and municipal issues amounted to only $1,620,000,000 for the ten months ended Oct. 31, 1943, and of this total only $413,000,000 represented new capital, the balance being issued to refund outstanding securities, mainly for the purpose of taking advantage of interest rates at or near the lowest in history. Included in this total were new stock issues of $116,000,000, of which

$51,000,000 was for new capital and $65,000,000 for refunding. Corporations were not in the capital market to any great extent, as their needs for increased plants for war purposes were met largely by government financing, and materials and labour were not available for other purposes. States and municipalities raised only $145,000,000 of new capital, finding their needs reduced by full employment and satisfactory tax collections, while the lack of men and materials prevented new construction. The Securities and Exchange commission's rule requiring competitive bidding on new public utility security issues under their jurisdiction was under attack.

Municipal obligations advanced in price in 1943 as the supply of new issues dwindled and demand increased with higher income taxes. Tax collections were excellent because of increased industrial payrolls, and bonds of lower grade tended to advance more rapidly than those of proven quality. Life insurance companies, which benefited little from tax exemption, disposed of large blocks of municipals in a receptive market. Many railroads benefited from the market for their bonds by making large purchases for the retirement of debt out of wartime earnings. Yields of taxable government bonds of the longer maturities remained stable, while short-term governments were issued on a somewhat higher basis. Highest grade corporate bonds yielded slightly less, approaching government bond yields. The yield of lower grade corporate issues fell even further, narrowing the gap between issues of the various grades and prompting the flow of investment into the several offerings of government bonds designed to meet the requirements of all types of investors. Bankers and brokers devoted their organizations and extensive experience to promoting the two War Loan campaigns conducted during 1943 by the U.S. treasury. Particular stress was laid on obtaining subscriptions from individuals as a measure to take up excess purchasing power while providing the financial sinews of war. Both campaigns resulted in oversubscriptions, total sales amounting to $40,676,000,000. (*See* WAR BONDS.) (E. B. L.)

Mutual Savings Banks.—Expenditures for war purposes increased rapidly after the United States became a belligerent nation and as a consequence there was more money available for deposit in savings banks, particularly in areas of great industrial activity. Total assets on July 1, 1943 were $12,436,067,000 and deposits credited to 15,552,095 accounts were $11,104,706,000, an increase of $758,333,000 in assets and of $750,174,000 in deposits during the year ended July 1, 1943. The combined surplus was $1,302,018,000 or 11.72% of deposits. Dividends averaged 1.87% in 1943, a slight decline from the average of 1.88% in 1942. The total number of mutual savings banks on July 1, 1943 was 535, the same as at the end of 1942.

Mutual savings banks continued to distribute large amounts of U.S. war savings bonds. In the 12 months ended Nov. 1, 1943 they distributed $490,494,225 par value of savings bonds and stamps. Of the total, $392,373,450 were series E, $12,837,798 were series F, $73,214,789 were series G and $12,068,188 were war savings stamps. After May 1, 1941 when the savings banks first became issuing agents for U.S. savings bonds, they distributed $1,139,217,844 par value of U.S. savings bonds and stamps, of which $913,359,720 were series E, $35,600,664 were series F, $166,363,027 were series G and $23,894,433 were war savings stamps.

During the three War Loan drives the mutual savings banks subscribed to Victory bonds for their own portfolios in the following amounts: First War Loan drive, Nov. 30, 1942–Dec. 23, 1942, $609,000,000; Second War Loan drive, April 12, 1943–May 1, 1943, $1,195,000,000; Third War Loan drive, Sept. 9, 1943–Oct. 2, 1943, $1,508,000,000.

Aside from U.S. government securities, the chief outlet for funds of savings banks in 1943 was insured mortgage loans of the Federal Housing administration. New York state banks were especially active in making these loans, because the New York state banking laws were amended to permit savings banks to make F.H.A. insured loans in states adjoining the state of New York, as well as in that state to which their lending was formerly confined. Uninsured loans in an adjoining state were legalized also, providing such loans were made on property within 25 mi. of the principal place of business of the lending bank. The New York law was further amended to permit savings banks to make uninsured loans not exceeding 80% of appraised value on real properties located not more than 50 mi. from the principal office of the savings bank and improved by single family, owner-occupied residences constructed not more than two years prior to the making of the loan. The previous limit was 66.6% of the appraised value.

On July 1, 1943 all the savings banks in New York state not previously admitted to the Federal Deposit Insurance corporation applied for membership in that corporation. Including these banks the total number of mutual savings banks in the Federal Deposit Insurance corporation on July 1, 1943 was 182, with deposits of $7,000,000,000 credited to 9,350,000 accounts. Following this action, the bank members of the Mutual Insurance fund, in existence since 1934, determined to liquidate that fund by returning its assets to the contributing banks. A first distribution of $37,695,000 was made Dec. 1, 1943.

In contrast to the action taken by the savings banks in New York, the Connecticut savings banks set up a new fund called the Savings Banks' Deposit Guaranty Fund of Connecticut, covering deposits of about $755,000,000 distributed among 900,000 accounts in 62 member banks. This organization took the place of the Mutual Savings Banks' Central fund organized ten years previously. An act passed by the general assembly had provided for the change in name and granted additional powers and duties, the most important of which was the absolute guarantee of all deposits in full in member banks.

Savings Bank Life Insurance.—On Oct. 31, 1943 there was a total of 204 banks in Connecticut, Massachusetts and New York having savings bank life insurance departments. Connecticut had eight issuing banks and ten agency banks; Massachusetts, 30 issuing banks and 112 agency banks and New York, 26 issuing banks and 18 agency banks. In Connecticut, the latest state as of 1943 to legalize savings bank life insurance, the total insurance in force on Oct. 31, 1943 was $2,060,177, representing 2,326 policies; an increase of $1,046,227 and 1,179 policies in the second year of operation. In Massachusetts the total in force on that date was $240,216,281 representing 296,635 policies; and in New York the total in force was $34,808,574, representing 38,901 policies.

British Savings Banks.—At the end of the fiscal year, Nov. 20, 1942, the Trustee Savings banks had total funds of £446,508,957; of which £264,577,260 were balances due depositors in the ordinary department, £113,918,096 were balances due depositors in the special investment department, £55,266,498 represented government stock held for depositors and £12,747,103 represented surplus funds. On Nov. 20, 1942 there were 91 Trustee Savings banks in the United Kingdom with 710 offices.

In the three-year period Nov. 21, 1939 to Nov. 30, 1942 the Trustee Savings banks made available £180,400,000 for war savings. Of this amount, increases in the balances due depositors in the ordinary department accounted for £116,100,000; sales of National Savings Certificates, sales of defense bonds and other war issues to depositors and investment of special investment department funds in treasury issues made up the remaining £64,300,000. (HE. BR.)

Bank of England. During 1943 the bank note circulation continued to expand, the growth between Jan. 6 and Nov. 3 being from £920,000,000 to £1,005,000,000. The chief causes of the increase were greater industrial activity, a rise in the average earnings of workers, and to some extent the prevalence of hoarding. To provide this new currency the fiduciary issue was increased from £880,000,000 to £950,000,000 on Dec. 1, 1942, while there were further increases to £1,000,000,000 on April 13, and to £1,050,000,000 on Oct. 5, 1943. In April 1943 notes of £10 and upwards ceased to be issued, and it was announced that those already in issue would be withdrawn as opportunity offered. There was some evidence that these large-denomination notes were being used in undesirable transactions. A temporary check at this time to the growth in the note circulation was in part attributable to this withdrawal.

The bank continued its work in connection with the financing of the war. Loans by the banks to the government against treasury deposit receipts increased by about £350,000,000 during the year to the end of Sept. 1943, when their total was £1,114,500,000. For a few weeks during October the weekly treasury bill issue was increased from £90,000,000 to £100,000,000. These extra bills were to mature in Jan. 1944, and so would put the banks in funds during the period of heavy tax collection.

On Aug. 31 the "tap" issue of 2½% national war bonds, 1951–53, was withdrawn and replaced by a new issue of 2½% bonds 1952–54.

The bank also assisted the dominions in the repayment out of their sterling balances of much of their long-term sterling debt. On Jan. 5 India 3½% stock, repayable in 1931 or any later year, was redeemed (£77,000,000 was outstanding when notice was given in Dec. 1941). In February and March vesting operations for five South African stocks (said to total about £42,000,000) and nine Indian railway sterling debenture stocks (said to total about £20,000,000) were carried through by the bank on behalf of the treasury.

During 1943 there were some relaxations of the exchange control procedure. "Sterling area" and "old" sterling accounts were abolished, and only one type of account was held by residents in the United States and Central America. In addition blocked sterling accounts were substantially reduced. The accumulation of sterling blocked in these accounts could now in most cases be remitted to the beneficiary, and further blocked sterling would be created only in the most exceptional circumstances. Dealings in sterling securities on behalf of non-residents were made much easier, and nonresidents could sell and reinvest the proceeds freely.

Remittances to evacuated children under the children's overseas reception board scheme were increased to a level which enabled most of the evacuees to maintain themselves without support from their hosts.

Following the expulsion of the enemy from French North Africa arrangements were made to specify French North and West African currencies, and to regulate payments between these territories and the sterling area.

Further releases of staff for national service were made during 1943. The bank retained only 53% of its male and 55% of its total prewar staff. The total clerical staff was 3,965, compared with 3,529 at the outbreak of war. This increase is accounted for by the formation of the wartime foreign exchange control, which employed 1,400 people at its peak in Oct. 1941, and employed 1,000 people by 1943. Much of the former London work of the bank had been evacuated to the country, and 1,500 men and women were employed at country premises. (N. E. C.)

Baptist Church. The conventions of both Northern and Southern Baptists for 1943 were postponed one year. The Southern Baptists were to hold their 1944 convention in Atlanta, Ga. May 16–18—a much briefer period than hitherto allotted for the annual meeting. One of the urgent requirements for this assembly was the necessity of planning for their centennial celebration in 1945. Lacking the inspiration of their convention in 1943, the executive officers sought to bring enthusiasm and challenge to the local churches through extended use of the denominational press in each state and increased efforts of the state secretaries. One significant result was the final payment of a 20-year-old debt of some $18,500,000.

The Northern Baptists were to hold their 1944 convention in Atlantic City, N.J., May 23–26. In lieu of their 1943 convention, Parish day services were organized for meetings in the local churches. The main features of these programs were recorded addresses by officers of the convention and missionaries home from foreign fields. In this way reports of successful work at home and abroad were brought to the people in their own parishes.

During the convention year, May-April 1942–43, the Baptists of the north raised a World Emergency fund of $728,686.66, which was in addition to their normal gifts for all benevolent purposes. This fund was to be spent for emergencies arising chiefly from war conditions. For the year 1943–44 the goal of the emergency fund is $1,500,000. The total objective was $4,500,000, approximately 25% above the receipts for the year 1942–1943. (R. E. E. H.)

Bar Association, American: *see* AMERICAN BAR ASSOCIATION.

Barbados: *see* WEST INDIES, BRITISH.

Barbour, W. Warren (1888–1943), U.S. politician, was born July 31 at Monmouth Beach, N.J. He served several terms as mayor of Rumson, N.J., served as delegate-at-large to the Republican national convention that nominated Herbert Hoover, and in 1931 was appointed to fill a senate vacancy caused by the death of Dwight F. Morrow. A year later, he was elected to fill the unexpired term. Barbour was elected again in 1938 to fill a vacancy left by the resignation of Senator A. Harry Moore, and was re-elected to this seat in 1940. He died in Washington, Nov. 22.

Barclay, McClelland (1893–1943), U.S. illustrator, was born May 9 in St. Louis, Mo. He studied at the Corcoran School of Art in Washington, the Art Students' League in New York city and the Art Institute of Chicago. Barclay began as advertising illustrator in 1912, created the famous "Fisher Body Girl" and did other "pretty girl" covers

for leading U.S. periodicals. He designed numerous patriotic posters during World War I and also had served as a camouflage expert for the navy. After the U.S. entry into World War II, he served in Australia and in New Guinea, where he recorded on canvas the fighting activity of U.S. forces. The navy department released a report on July 24 that he was missing in action.

Barium Minerals. Production of crude barite in the United States decreased from 503,156 short tons in 1941 to 429,484 tons in 1942, a drop of 13%, as compared with an increase of 24% in 1941. (G. A. Ro.)

Barker, Lewellys Franklin (1867–1943), U.S. physician and educator, was born Sept. 16 in Norwich, Ont., Canada. He studied medicine at the University of Toronto, later completing his studies at the universities of Leipzig, Berlin and Munich. Dr. Barker joined Sir William Osler's staff at Johns Hopkins university, where he became resident pathologist in 1894 and later associate professor of anatomy and pathology. In 1900, he transferred to Rush Medical college as professor of anatomy and department head. When he returned to Johns Hopkins in 1905, he was named professor of medicine and chief physician of Johns Hopkins hospital, holding both posts until 1913, when he became professor emeritus and visiting physician at the hospital. In 1899, he was sent to the Philippines as medical commissioner to help fight the bubonic plague. He died in Baltimore, July 13.

Barley. The 1943 barley crop of 322,187,000 bu., as estimated by the United States department of agriculture, fell one-fourth short of the record crop produced in 1942 but was almost a third above the average of 1932–41 of 243,373,000 bu. This was in accord with the 1943 goal, which called for less acreage than in 1942.

U.S. Production of Barley by Leading States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
North Dakota	63,648,000	67,454,000	Texas	3,341,000	4,818,000
California	36,372,000	43,819,000	Pennsylvania	2,750,000	4,098,000

Utah	7,097,000	6,027,000	Iowa	1,102,000	4,158,000
Oklahoma	3,750,000	10,025,000	North Carolina	922,000	1,058,000
Wyoming	3,302,000	2,000,000	Ohio	800,000	1,785,000

Barley acreage was expanded greatly in the Great Plains states but was grown on a much smaller acreage in the central states. The crop gave way to such war-emergency crops as flax, beans, soy beans and corn. In the western states yields were very good on irrigated land. (J. C. Ms.)

Barr, Norman Burton (1868–1943), U.S. welfare worker, was born Jan. 27 in Mount Palatine, Ill., and graduated from the University of Nebraska, 1893, and the Presbyterian Theological seminary, 1897. He was one of a group of notable welfare pioneers in Chicago, including Jane Addams and Graham Taylor. He founded the Olivet institute in a tenement district on Chicago's near north side in 1897 and was pastor of its church for 40 years. His small mission developed into a $750,000 institution. Dr. Barr maintained a free summer camp for mothers and children and also an "eviction house" which temporarily lodged evicted tenants. He retired from the institute in 1937, and died in Chicago, April 1, 1943.

Baruch, Bernard Mannes (1870–), U.S. financier and government aide, was born Aug. 19 in Camden, S.C., the son of a Confederate surgeon. He moved to New York city at the age of 12 and later attended City college of New York. He entered Wall street, became a customer's man and speculator and by the age of 42 had amassed a fortune estimated at between $12,000,000 and $15,000,000. In 1916 President Wilson invited him to Washington, D.C., as a civilian member of the Advisory commission of the Council of National Defense. In March 1918 Baruch was made head of the War Industries board and was given virtually dictatorial authority over production. Under his guidance, U.S. industry functioned smoothly and poured war supplies overseas. He left his post in Jan. 1919 and went with President Wilson to the Versailles conference in the capacity of economic adviser.

During the early years of U.S. participation in World War II, Baruch headed a committee investigating the rubber crisis, and in Sept. 1942 he urged immediate measures to secure a new rubber supply, warning that failure to do so would cause a collapse on both the home and war fronts. He returned to government service in June 1943 as adviser on industrial production to OWM Director James Byrnes' personal staff, serving without title or salary. On Sept. 17, 1943, Baruch recommended a labour pool to meet the manpower crisis; he suggested that draft deferments be granted on grounds of occupation rather than on dependency. On Nov. 6, Byrnes named Baruch to head a new unit established within the OWM structure to deal with adjustments in war production and problems related to postwar conversion of the U.S. industrial war machine to a peacetime economy.

Basalt: *see* STONE.

Baseball. In 1943, there were fewer leagues operating because a great fraction of peacetime professional players and turnstile spectators were wearing war uniforms in distant parts.* The 1943 world series play-by-play description, via short-wave, reached as far as Australia and Iceland to invisible audiences in camps and bases and even in units close to battle lines.

The 1943 world series, played by the same teams as in 1942, the New York Yankees, American league champions, and the St. Louis Cardinals, National league pennant-winners, set a new all-time high record of attendance for a 5-game series, 277,312, surpassing the record of 276,717, set in 1942. The third game of the 1943 series, played at Yankee stadium, New York, Oct. 7, hung up a new all-time attendance record for a single game, 69,990, exceeding the previous record of 69,902, made in the fourth game, 1942.

Total receipts for the series, $1,205,784 (including $100,000 for radio broadcasting privileges), also reached a new all-time high for a 5-game series, topping the former record, $1,205,249, made in the 1942 world series. More than one-fourth of this total, a sum of $308,373.48, representing the receipts of the third and fourth games, minus players' shares, and the total radio receipts, was donated to the Red Cross and the National War Fund, Inc., each receiving half.

These two agencies likewise divided equally the proceeds of the 16 special war games played by the major leagues on two special days, June 30 and July 28. Each of the eight clubs in each league played one war game at home and one away from home. The eight National league games produced $175,118.96 and the American league program turned over $151,439.88.

*As of Dec. 1, 1943, there were 347 major league players and 2,915 from the minors serving in the armed forces.

The Baseball Equipment fund, baseball's medium for supplying the armed forces with bats, baseballs and catching equipment, received $65,174, the proceeds of the annual All-Star game between picked teams from the two major leagues. The 1943 game was played in Philadelphia July 13, a night game. To this sum was added $25,000, the price of radio rights, a $20,000 donation from Commissioner Landis' office and $2,500 from each league treasury, making a total of $115,174 for the B.E.F. working capital.

The Baseball Equipment fund during 1943 continued its sending of "kits" containing bats, baseballs and catching equipment through army and navy headquarters to camps and bases in America and on overseas fronts. In 1943 no. 1 kits (bats and baseballs) were placed in 7,273 service units and 827 of the no. 2 kits (with catching equipment), totalling 8,100 kits as compared with 5,306 distributed in 1942. The report of the B.E.F. figured the 1943 output at 13,491 dozen baseballs, 40,473 bats, 26,982 rule books and 1,489 catching outfits (mitt, body protector, shinguards and mask). Through the B.E.F., the *Sporting News*, baseball's weekly newspaper, published by J. G. Taylor Spink, St. Louis, reached camp libraries, ships at seas, overseas units and U.S.O. clubs (about 4,000 weekly). Foul balls knocked into the stands at major league parks and returned by fans were shipped in lots of a dozen each for use in the armed services during recreation periods.

The Season.—The two major leagues played complete 154-game schedules, as in peace years, but the bookings of the teams were arranged to reduce travel to a minimum, in conformity with the program of the Office of Defense Transportation.

This was most prominent in the case of spring training. Instead of conditioning players in Florida, California and Texas, the 16 major league clubs pitched their training camps inside a boundary known popularly as "The Landis-Eastman Line," a marker prescribed by K. M. Landis, commissioner of baseball, after consultation with Joseph B. Eastman, director of the O.D.T. The southern limit of the training area was marked by the Potomac and Ohio rivers, the western by the Mississippi. The sole exception was the camp of the St. Louis Browns, of the American league, which was at Cape Girardeau, Mo. Both St. Louis clubs had the option of staying on their own side of the Mississippi, but the National league Cardinals nevertheless crossed over to do their training at Cairo, Ill.

In order to fit the round-the-clock working schedules of warplants, shipyards, etc., starting times of ball games during 1943 were literally "all hours." On Aug. 11, 1943, there were major league games starting at the following ticks of the clock: 10:30 A.M., 12 noon and 1:30, 2:30, 3:30, 5:30, 5:45, 8:30 and 9:30, all P.M. Newark and Milwaukee had some 9:30 A.M. games. In the latter city the swing-shift fans entering the stands had their risibilities tickled at the sight of one of the veteran coaches of the home team pretending to be just finishing his night's sleep with home plate for his pillow.

Total attendance at big league games fell off about 13% from 1942, according to the Associated Press tabulation, in part attributable to the fact that in both leagues the pennant races became one-sided in their closing weeks. Five clubs showed gains over 1942, most notably the Philadelphia Nationals, who more than doubled their 1942 gate. The New York clubs were among those showing substantial losses; Brooklyn had a greater falling off than any of the other 15 clubs, but despite the drop of nearly 400,000, the Dodgers led both leagues in total home attendance.

How the 1943 attendance figures compare with 1942 may be noted in the first table in the next column.

In both leagues the pennant races were wide open at the finish. Reversing the trend of baseball fashions of modern times, the

Attendance figures, 1943 and 1942

NATIONAL LEAGUE	1943	1942	Difference

Grand total	7,714,636	8,874,755	−1,160,119

National league pennant-winner in 1943 had the wider margin of superiority over its contenders—the St. Louis Cardinals owning an 18-game advantage over the second-place Cincinnati Reds at the finish, while the New York Yankees stood 13½ ahead of the American league runner-up, the Washington Senators.

St. Louis, however, fell 1 victory short of equalling its 1942 total of 106. The Yankees were 5 games behind their 103 bag of 1942. The Cardinals' 18-game lead over second place was the largest in National league history since 1906, when the Chicago Cubs, winning 116 games for an all-time record, stood 20 games ahead of the second-place New York Giants at the finish.

The World Series.—The 1943 world series, the second played since Pearl Harbor, brought together the same clubs which had competed in the 1942 post-season classic, though important players on both sides had joined the armed forces since the eventful October days of 1942.

War travel imperatives made changes in the world series schedule. In order to have only one mass excursion between New York and St. Louis, the first three games of the 1943 series were played at Yankee stadium. Peace schedules specify the first two games in one city, the next two in the other, then, if further play is necessary, a return to the first city for as many games as are required for one team to record four victories.

The Yankees, by winning the 1943 series, stretched the club's list of post-season inter-league championships to 10, twice as many as any other club has, and one-fourth of all the world

THE FREAK BALLOON BALL of Pitcher Truett Sewell of the Pittsburgh Pirates was largely responsible for his winning 21 games in 1943. The ball travels 25 ft. into the air and falls almost vertically across the plate. Circles indicate its path

series titles decided since competition began between the National and American leagues with the "unofficial" world series of 1903. The Boston and Philadelphia teams of the American league rate next best to the Yankees with five each. These three clubs have been responsible for 20 of the 25 world championships won by the American league of the 40 that have been contested.

Joe McCarthy, Yankees' manager, recorded his seventh world championship, placing him one notch further ahead of his nearest competitor for world series leadership honours, Connie Mack, who managed the Athletics of Philadelphia in their five series triumphs.

By defeating the Cardinals, 4 games to 1, the Yankees reversed the 1942 score. In 1942 the Yankees won the first game, the Cardinals the next four. In 1943 the first two games followed the 1942 pattern, the Yankees winning the first, the Cardinals the second. Then the picture changed, the Yankees sweeping on to take the next three.

Scores of the five games: First game: New York 4; St. Louis 2. Second game: St. Louis 4; New York 3. Third game: New York 6; St. Louis 2. Fourth game: New York 2; St. Louis 1. Fifth game: New York 2; St. Louis 0.

Another reverse of the 1942 picture was that the only Cardinal victory in the 1943 series was pitched by Morton Cooper, Cardinal ace, who in 1942, when he was named the National league's most valuable player, was defeated in the only game the Cardinals lost and batted out of the box in the other game he started. A sombre note was the sudden death of Robert Cooper, father of the Cardinals' brother battery, Morton and Walker Cooper, in the early morning of Oct. 6. Despite the shock of the news, the Cooper brothers carried through with their battery assignment that afternoon, Morton pitching and Walker catching the game which the Cardinals won, 4 to 3. The two-day recess between the third and fourth games made it possible for the brothers to attend their father's funeral on Saturday, Oct. 9, without being absent from the Cardinals' battle line. Morton appeared again as pitcher in the final game, striking out the first five Yankees who came to bat and losing an intense pitchers' battle with Spurgeon Chandler by the score of 2 to 0.

Walker Cooper, who was the Cardinals' field-captain, caught every inning of the series until he suffered a fracture of his right thumb in the 5th inning of the last game.

Though some of the brightest stars of the 1942 world series on both sides had entered the armed forces—Joe DiMaggio, Charley Ruffing, Phil Rizzuto and Buddy Hassett of the Yankees; Terry Moore, John Beazley, Enos Slaughter and Jimmy Brown of the Cardinals—the memory of 1942's thrills whetted the appetite of the baseball world for the 1943 replay.

The Yankees richly repaid the confidence of their admirers by winning in handy fashion. They played courageous and alert baseball, taking full advantage of every Cardinal lapse in fielding and brainwork. Spurgeon Chandler, the Yankee pitching ace, was every inch an ace in the world series. He held the Cardinals safe in the first game with 7 hits for a 4–2 decision; in the final game he scattered 10 St. Louis hits (all singles) for a 2–0 triumph to end the series and clinch the crown.

Bill Dickey, mighty catcher of the Yankees, smote a home run to the roof of the St. Louis right-field pavilion in the 6th inning of this final game with Keller on base to account for both the Yankee runs, and thereby placed his name in a bracket by itself in the all-time records. It was his eighth world series as a member of the Yankees. His winning homer made him the only man in history who has been on that many victorious world series teams. It climaxed an eventful year for the Yankee catcher in which he led the American league in batting with .351, although he was in only 85 games and did not amass as many as 400 times at bat, the necessary number to be awarded the league's batting championship.

Another outstanding Yankee hero was Marius Russo, southpaw who scored a notable victory over Brooklyn in the 1941 world series, but was not prominent in the Yankee picture in the ensuing two seasons because of muscular impairment of his pitching arm. His 1943 achievement was only a one-day performance, but that day he was the whole show. He went to the box in the opening St. Louis game, the 4th game of the world series. His team led in games won, 2 to 1, but the Cardinals were now in St. Louis for the first time in the world series schedule. Experts commenting on McCarthy's choice of Russo called it a "gamble," rather looking for a rout of the "lame-arm" southpaw and a Cardinal resurgence which would tie the series score and set the stage for a redhot climax on the home grounds of the 1942 world champions. Russo, however, had the Cardinals shut out for the first 6 innings. In the 4th the Yanks scored a run on a single by Dickey off Max Lanier, no. 1 St. Louis ace for the series as selected by the Cardinal manager, Billy Southworth, that is, starter of the first game in New York and again in this

heavily important first game in St. Louis.

Dickey's single drove home Gordon and put Russo ahead 1 to 0. In the 7th inning a pair of Yankee infield errors allowed the Cardinals to tie the score with an unearned run, so that Russo, for all his fine pitching, stood on only even terms with his foemen with only two innings left to play. It was then that Russo stepped beyond his role of pitcher and "won his own game," as baseball phrases it when a pitcher does something notable as a batter. He came to bat first for the Yankees in the 8th. Batting right-handed against the Cardinal southpaw, Harry Brecheen, the Yankee pitcher drove a long 2-bagger to the extreme left-field foul line corner of the ball park. The next two Yankees did what was ordered, Stainback sacrificing Russo to third and Crosetti sending him home by sailing a long fly to centre on which Russo scored easily after the catch.

Russo then had to go to the box and suppress the Cardinals in their last two turns at bat. The Cardinals had two infield singles in the 8th but could not score. After Marion doubled with one out in the 9th, Russo retired the next two batters to consolidate the 2 to 1 score in his favour, which he built with his 7th-inning double.

Hero honours on the Yankee side went also to Frank Crosetti, veteran shortstop, whose all-around play was superb, Bill Johnson, the first-year third baseman, whose triple with the bases filled broke up the 3rd game and whose .300 batting average for the series was tops for the Yankees, and John Lindell, former pitcher converted into an outfielder by war exigencies, whose successful slide to third base was the turning-point in the 3rd game of the series, setting the stage for Johnson's base-clearing triple and the victory which put the Yankees ahead, 2 games to 1.

Palms were bestowed likewise on Joe Gordon, Yankee second baseman. Gordon proved a steady rock of strength for the Yankees in their 1943 series, hitting a home run in the first game to break a 1–1 tie score and setting three new fielding records. He handled 43 chances without any error, crossing off the record of 35 for a second baseman in a five-game series, which had stood since Eddie Collins of Philadelphia made it in 1910. Gordon's new record for most putouts, 20, topped the old one of 19, set by George Cutshaw of Brooklyn in 1916. His 23 assists erased the 21 first achieved by Germany Schaefer, of Detroit, in 1907, and equalled by Johnny Evers of Chicago in 1908.

On the Cardinal side, besides the pitching of Mort Cooper in the shadow of his family sorrow, the outstanding performer was Martin Marion, slim shortstop, who not only maintained his title to the no. 1 shortstop of his league but was the leading hitter of the series, both sides, with .357. His five hits included two doubles and a home run, his homer starting the scoring in the only game the Cardinals won. Ray Sanders, first baseman, also delivered a home run in this game and shared honours with Cooper and Marion in the Cardinals' brief taste of success.

The All-Star Game.—The annual All-Star game between picked teams of the two major leagues, played at Shibe park, Philadelphia, July 13, a night game, was an American league victory by the score of 5 to 3. The attendance was 31,938, about 5,000 below capacity.

Morton Cooper was the starting and losing pitcher in the All-Star game. A home run into the left-field pavilion with two on bases by Bobby Doerr, Boston Red Sox second baseman, sent across 3 runs in the 2nd inning. Ken Keltner's (Cleveland) double and Dick Wakefield's (Detroit) single added a fourth American league run off Cooper in the next inning.

Against the subsequent National league pitchers, John Vander-Meer, of Cincinnati, Truett Sewell, of Pittsburgh, and Alva Javery, of Boston, the American league stars were able to score only one run, an unearned run that counted when Billy Herman Brooklyn second baseman, threw wild to home plate on a double steal play.

But the trio of American league pitchers, Emil Leonard, Washington, Harold Newhouser, Detroit, and Tex Hughson, Boston, kept the National league's 10 hits so sparsely placed that they were good for only 3 runs, in three different innings. Vince DiMaggio, Pittsburgh, made the most impressive hits of the contest, a booming triple against the left-field wall in the 7th inning and a home run that landed in the upper left-field stand far over towards centre field in the 9th. In each case, DiMaggio was the first batter up in the inning and his power-drives, either one good enough to break up the game had there been men on bases, were worth only one run each.

The world series managers of 1942 and 1943 (Joe McCarthy and Billy Southworth) acted as managers of the rival All-Star teams. It was the 8th American league victory in 11 All-Star games played, starting at the Chicago World's Fair in 1933, giving the American league an even more impressive success score in All-Star game play than their 25–15 world series tabulation.

Individual Achievements.—The most-valuable-player honours for the year, as voted by the Baseball Writers' association, went to Spurgeon Chandler, Yankee pitching ace, and Stan Musial, St. Louis Cardinal outfielder, who achieved the National league batting championship in his second major league season. His hitting and all-around play contributed heavily to both the 1942 and 1943 pennant winning. Chandler led the American league pitchers in the W-L percentage with 20 victories against 4 defeats and in the earned-runs-allowed average with 1.64, the best figure recorded by a first-string major league pitcher since Walter Johnson, Washington, chalked up 1.49 in 1919. Chandler's two world series victories were the key games, the opening contest and the title-clinching 5th game.

Musial's .357 batting average for 157 games was 27 points better than the runner-up for the National league batting title, the veteran Billy Herman, of Brooklyn. Musial led in total number of hits, in doubles and in triples. His hit-total, 220, made him the first National leaguer since 1939 to reach the 200-hit mark.

Luke Appling, Chicago White Sox shortstop, was the American league batting champion, the second time he achieved the crown, though his 1943 average of .328 was 60 points less than in 1936, his first championship year.

The home run champions in each league were also the top

THE WORLD SERIES of 1943 provided the annual relief from less pleasant news, noted Bishop of the *St. Louis Star-Times* in this cartoon, "Thanks for the Lift, Pal!"

run-drivers, Rudy York, Detroit first baseman, leading the American league with 34 homers and 118 runs-batted-in. Bill Nicholson, Chicago Cubs' right-fielder, had 29 homers to lead the National and 128 RBI.

The National league had no one pitcher outclassing his competition as did Chandler in the American and as Mort Cooper did in the senior circuit in 1942. Percentage honours for 1943 in the National went to Whitlow Wyatt, Brooklyn, with 14 wins against 5 losses. Howard Pollet, St. Louis southpaw, who joined the air force in mid-July, led the earned-run-averages with 1.75, the best in the National league since Carl Hubbell's 1.66 in 1933. Truett Sewell, Pittsburgh, and Elmer Riddle, Cincinnati, tied with Cooper, of the Cardinals, in total victories, each having 21. Cooper's percentage was the best of the trio, showing only 8 defeats.

The earned-runs-allowed tables in the National league indicated a remarkable superiority performance by the St. Louis pitchers. Pollet was the first of three Cardinal pitchers holding the first three places on the list of pitchers with 10 or more complete games to their credit, Lanier ranking second and Cooper third. Two other Card pitchers, Alpha Brazle and Harry Brecheen, led the secondary list, pitchers working 75 innings or more but not so many as 10 complete games. Four of the five are left-handers, Cooper being the only right-hand pitcher.

Ace Adams, New York Giants' bull-pen specialist, set a new 20th century record for number of games pitched, 70, surpassing the existing record of 61 which he wrote into the archives in 1942. Only one of his 1943 games was a complete contest, the rest being emergency work in relief of other pitchers.

Minor Leagues.—Nine minor leagues—three class AAs, one A-1, one A, two Bs and two Ds—operated in 1943, as compared with 26 that played full seasons in 1942, 41 in 1941 and 47 in the peak year of National Association history, 1912.

Eight of the nine active in 1943 held Shaughnessy post-season playoff rounds in which the first division teams met in an elimination series for the league championship. Lancaster, pennant-winner in the Inter-State league, was the only one of the eight pennant-winners victorious in a post-season playoff.

All three of the circuits which have composed class AA ever since that classification was instituted played full seasons. The Los Angeles Seraphs, Pacific Coast league pennant-winners, lost out in the playoffs, won by the San Francisco Seals, who finished second in the pennant race.

The Milwaukee Brewers, American association pennant-winners, had to yield to the third place Columbus Red Birds in the playoffs while the Syracuse Chiefs, International league third-placers, were victorious in the playoffs after the Toronto Maple Leafs won the pennant. Columbus defeated Syracuse, 4 games to 1, in the annual Junior world series between the playoff winners of these last two AA organizations. The Birds thus made Junior world series history, for it was their third straight victory in successive years. They defeated Montreal's Royals in 1941 and Syracuse in 1942. In the annals of the series, which has been played 26 times since its first meeting in 1904, no club before ever won three years in succession. It was the sixth time Columbus represented the association in the Junior series and its fifth successful title-quest. The Red Birds scored victories over the International league champions of 1933 and 1934, Buffalo and Toronto. Their only series defeat was in 1937, when they lost to the Newark Bears. The 1943 series adjusted itself to the war travel exigencies by playing the first three games in Syracuse, the last two in Columbus.

The Dixie series, played traditionally each year between the champions of the two class A-1 circuits, the Southern association and the Texas league, was absent from the baseball calendar because the Texas league did not operate in 1943. The Southern association, the only minor league extant which did not have Shaughnessy playoffs, returned to the split-season system of deciding its championship. Nashville's Vols, winners of the first half of the schedule, defeated New Orleans, second-half winners, in the playoff round for the title, 4 games to 1.

Adding together the two halves of the split-season, Nashville won 83 and lost 55 for a .601 percentage while New Orleans won 78 and lost 58 for .574, so that if played without splitting, the schedule still would have crowned Nashville pennant-winner. It was Nashville's fifth straight year to represent the Southern association in the Dixie series, had the series been played. They were victorious over the Texas league champions in 1940–41–42, the all-time record performance for a Southern association club.

In the only class A league that functioned, the Eastern, Elmira's Pioneers, after finishing second in the pennant race, won the playoffs, beating the pennant-winning Scranton Miners.

The third-place Norfolk Tars were first when the playoffs of the class B Piedmont league were concluded, the pennant-winning Portsmouth Cubs going down to defeat. Lancaster's Red Roses were both flag-winners and playoff winners in the other class B circuit, the Inter-State league.

The class D leagues alive were the Appalachian and the Pennsylvania-Ontario-New York. The Bristol Twins won the pennant and the runner-up Erwin Aces the playoffs in the Appalachian while the Pony league pennant-winners, the Lockport White Socks, had to give way to the Wellsville Yankees in the playoffs.

Minor league attendance statistics in the nine circuits which operated indicated that curtailment of night baseball and gasoline rationing regulations played a major role in the reduced total attendance at ball games during 1943.

The American association, comprising cities in the Mississippi and Ohio valleys mainly, Columbus, Louisville, Indianapolis, Toledo, Milwaukee, Minneapolis, St. Paul and Kansas City, reported a total of 1,359,059, an 8.2% increase over 1942's 1,247,320.

The other eight leagues ranged downward in comparative figures. The Eastern league—Elmira, Scranton, Albany, Hartford, Springfield, Mass., Utica, Wilkesbarre and Binghamton, cities

located in a zone in which pleasure-driving was taboo during the summer months—showed a 32% drop, from 700,388 as of 1942 to 456,194.

The pleasure-driving ban was modified as the Eastern playoffs were starting, whereupon the 16 playoff games played to 66,461, the highest in the league's history since playoffs were instituted in 1937. One game, the 17-inning 3 to 3 tie between Elmira and Scranton at Elmira Sept. 26, set a new league record for a single game, 8,618. (W. E. Bt.)

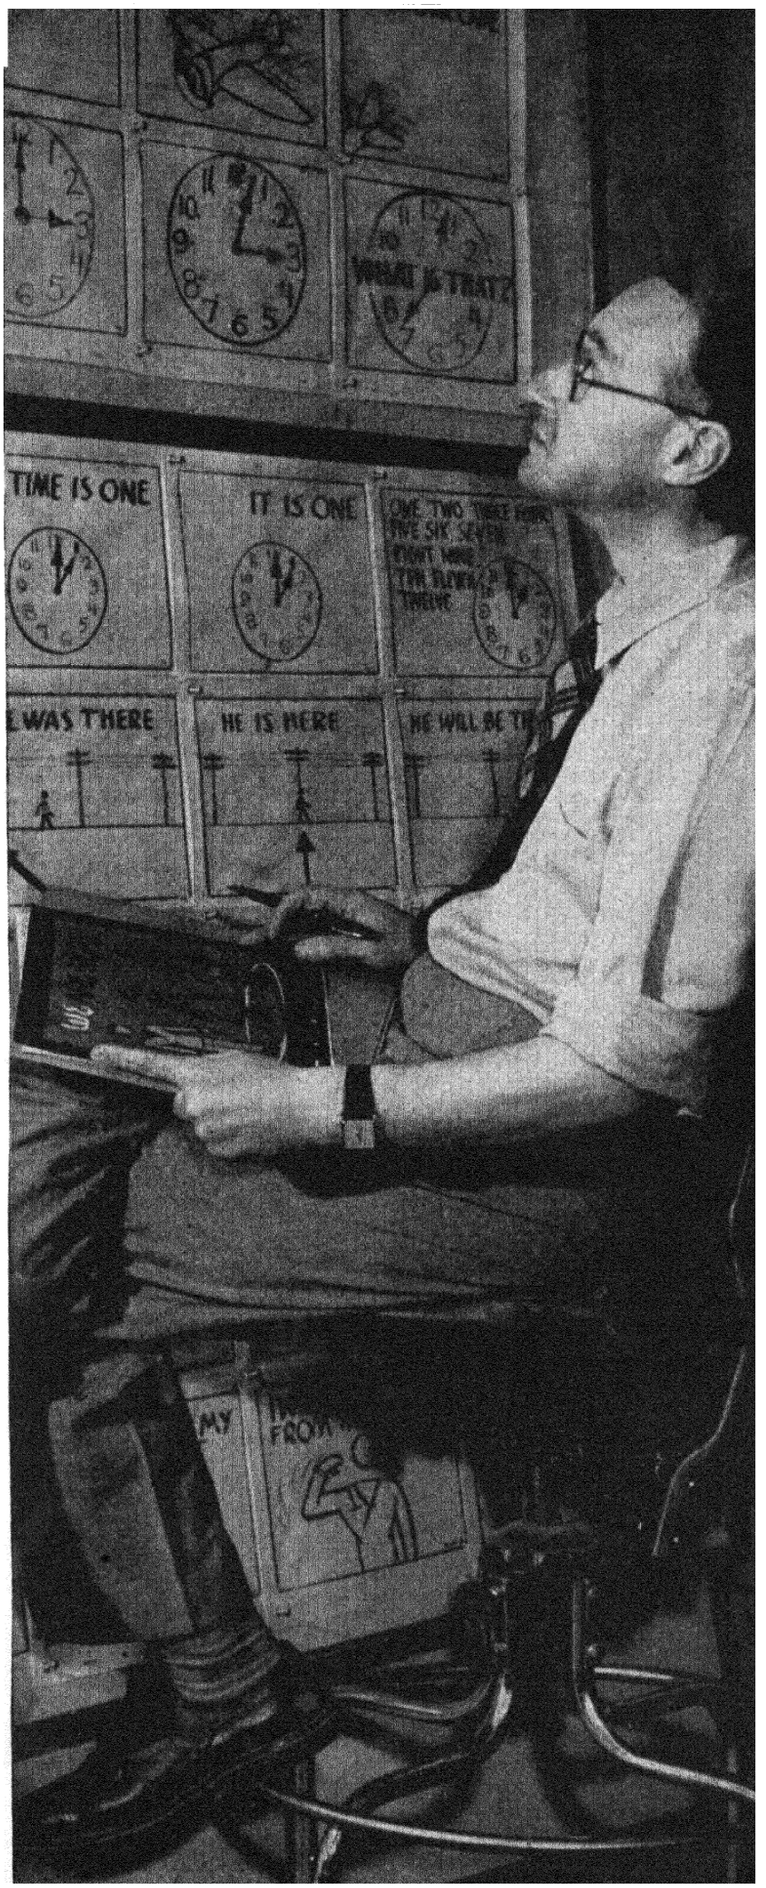
Basic English. Basic English (British American Scientific International Commercial) is a system of 850 English words sufficient for the needs of ordinary conversation and written communication. The words were selected and the system developed between 1925 and 1932 by C. K. Ogden, M.A., of Magdalene college, Cambridge, England, editor of The International Library of Psychology, Philosophy and Scientific Method; and author of *Basic English, The System of Basic English,* etc.

The chief purposes of the system are:

1. To serve as an international auxiliary language for use throughout the world in general communication, commerce and science.
2. To provide a rational introduction to unlimited English; both as a first step, complete in itself, for those whose natural language is not English, and as a grammatical introduction, encouraging clarity of thought and expression, for English-speaking peoples at any stage of proficiency.

The vocabulary of Basic is made up of 400 general nouns, 150 adjectives, 100 "operators" (verbs, particles, pronouns, etc.) and 200 names of picturable things. All the Basic words are in common use but their selection was directed by their co-operative utility rather than by their frequency as determined by word counts. The syntax of Basic is that of normal English. There is accordingly nothing to be unlearned in passing from Basic to a more complete English.

The Basic word list was arrived at by:



1. The reduction of verbs to 16. Within the system this avoids the necessity of supplementing noun forms with corresponding verb forms.
2. The elimination: (a) of all words (with the exception of common objects) which can be defined in not more than ten other words in the Basic word list; (b) of words which, whether capable of definition within the set limit or not, are primarily emotive rather than referential; (c) of words which, though not capable of definition within the set limit have chiefly a literary or stylistic value; (d) of words which, whether capable of such definition or not, are used in context too abstruse for the level of general communication.

It need hardly be remarked that misapprehension may arise if the vocabulary is considered without reference to the principles on which it is based, and the specific recommendations as to word uses made in *The Basic Words* and *The ABC of Basic English.*

To its 600 nouns Basic English adds a list of 50 terms which, through world-wide diffusion, have already acquired international intelligibility (*e.g.,* passport, radio, etc.).

While the 850 words of the general Basic vocabulary are sufficient for the needs of ordinary communication, it is not claimed for them that they can express adequately the technicalities with which specialists alone are concerned. To this end further lists of words are appended—100 general science words and 50 words for each of the principal sciences (see *Basic for Science,* 1943). Similarly in the Basic version of the Bible 50 additional words (for verse reading) are used and 100 words of special Biblical significance. In practice it is found that native English speakers have little difficulty in learning to restrict themselves on occasion within the limits of Basic.

As a teaching system Basic was in extensive use before World War II in more than 30 different countries. The economy and wide utility of its vocabulary and its simplicity of construction (due to its treatment of the verb) enable the learner to make very rapid progress into its effective use in all forms of communication. Teaching texts include: *Basic Step by Step* (adapta-

NO "VERBS"

It is possible to get all these words on the back of a bit of notepaper because there are no "verbs" in Basic English.

A week or two with the special records gives a complete knowledge of the system for reading or writing.

EXAMPLES OF WORD ORDER

The camera man who made an attempt to take a moving picture of the society women before they got their hats off did not get off the ship till he was questioned by the police.

We will give simple rules and you will soon.

RULES

Addition of "s" to things when there is more than one.

Endings in "er," "ing," "ed" from 300 names of things.

"ly" forms from qualities.

Degree with "more" and "most."

Questions by change of order and "do."

Form-changes in names of acts, and "that," "this," "I," "he," "you," "who," as in normal English.

Measures numbers, days, months and the international words in English form.

Basketball. University of Illinois' famed "Whiz Kids" and Wyoming university shared honours in collegiate basketball during 1943. Illinois captured its second straight Big Ten championship with a starting team of juniors, and generally dominated the sport in the middle west. The Illini did not take part in postseason competition, and at the start of the 1943–44 season all of the "Whiz Kids" were in the armed services. Wyoming started its victorious campaign by winning the Rocky Mountain conference and went on to win the National Collegiate Athletic association tournament.

In a Red Cross benefit, Wyoming defeated St. John's college of Brooklyn, winner of the Madison Square Garden invitational, by a 52–47 score.

Dartmouth topped the Eastern league for the sixth straight year, while Duke held its title place in the south although menaced by George Washington. Rice and Texas shared honours in the southwest, while Tennessee and Kentucky dominated the Southeastern conference.

Washington replaced Stanford as the Pacific coast's No. 1 team, and Kansas and Creighton led the Big Six and Missouri Valley, respectively.

Phillips "66," made up largely of former Oklahoma A. & M. players, won the National A.A.U. championship with a 57–40 victory over the Denver Legion in the final. The annual tournament, held for the ninth successive time at Denver, Colo., attracted 34 teams. The two finalists placed two players each on the "All-American" A.A.U. team, Phillips with James McNatt, forward, and Gordon Carpenter, guard, and Denver Legion with Robert Gruenig, centre and Robert Doll, guard. Kenneth Sailors of Wyoming university earned the other forward position.

The American Institute of Commerce of Davenport, Ia., won the National Women's A.A.U. basketball championship with a 41–31 triumph over Des Moines in an all-Iowa final.

The Washington Bears won the U.S. professional basketball championship in the annual tournament at Chicago. The Oshkosh All-Stars were second and Fort Wayne, winner of the National Pro league title, was third. The Philadelphia Sphas won the American Professional league championship. The College All-Stars defeated the Washington Bears in the 1943–44 inaugural, 35 to 31. (M. P. W.)

Baur, Harry (1880?–1943), French actor, was born in Paris, the son of Alsatian parents. From the amateur stage in Marseilles, he worked his way to Paris and until World War I enjoyed moderate success in the capital's theatres. He was invalided out of the war and returned to the Paris stage, but soon received several motion picture contracts and quickly climbed to fame as one of the leading French character actors. His most successful roles were as Jean Valjean in *Les Miserables*, M. Lepic in *Poil de Carotte*, Ludwig van Beethoven in *The Life and Loves of Beethoven*, the mad emperor in *The Golem*, the police inspector in *Crime and Punishment* and the title role in *Rasputin*. According to a Stockholm report, he was arrested in Berlin in May 1942, for forging an "ahnpass," an Aryan ancestry certificate. A Vichy radio report of April 8 carried the news of his death in Paris.

Bauxite. No statistics were made public on bauxite output in any of the important producing countries after 1941, and of these many were rough estimates.

World Production of Bauxite

(Metric tons)

In the United States the bureau of mines, assisted by the Geological Survey, carried on extensive exploratory programs in the southern states, and while the larger portion of the large tonnages that were developed was low-grade ore, sufficient commercial ore was found to help out materially in meeting the demand. To supplement the exploratory program for new ore bodies, extensive experimental work was also done on the development of methods of utilizing low-grade ores. However, late in 1943, when the supply of aluminum began to catch up with demand (*see* ALUMINUM) this work was sharply curtailed, in order that the funds and manpower involved might be utilized more effectively on materials, the supply of which was still short of current demand. (G. A. Ro.)

Beans, Dry. A record crop of dry beans of 22,799,000 bags was harvested in 1943 according to estimates by the U.S. department of agriculture. This crop was 15% larger than the 1942 crop of 19,035,000 bags and 52% larger than the 10-year average 1932–41. An increased production of 55% was called for by the government to meet the greatly increased military, lend-lease and civilian requirements. The acreage was increased by growers 29% over 1942 but the average yield was below 1942 though above the 10-year average. A price-support program was operated by the government with ceiling prices to growers, who received, however, about 10% higher prices than in 1942. (J. C. Ms.)

U.S. Production of Dry Beans in Leading States, 1943 and 1942

(in 100 lb. bags)

State	1943	1942	State	1943	1942
Michigan	5,707,000	5,284,000	New York	1,119,000	1,436,000

Wyoming	1,378,000	1,024,000	Montana	549,000	338,000

Beatty, Sir Edward Wentworth (1877–1943), Canadian industrialist, was born Oct. 16 in Thorold, Ont. He studied law at Toronto university and joined the legal department of the Canadian Pacific Railway company in 1901, becoming vice-president in 1914. In 1918, he was made president and chairman of the road, and held both of these posts until 1942, when he resigned from the presidency because of illness. He was knighted in 1935 and was appointed Canadian representative of the British ministry of ship-

ping in 1939. Sir Edward was chancellor of McGill university from 1921 until his death in Montreal, March 23, 1943.

Bechuanaland Protectorate: *see* BRITISH SOUTH AFRICAN PROTECTORATES.

Bee-keeping. The 1943 crop of honey was estimated to be 189,000,000 lb. by the United States department of agriculture compared with a crop of 177,800,000 lb. produced in 1942 but lower than the average of other recent years. The number of colonies of bees was estimated to be 4,900,000 hives in 1943 which shows a decline for several years. This decline was attributed to the growing shortage of labour and the smaller number of skilled bee-keepers on farms, as well as to the sugar shortage. The cold wet spring was unfavourable for bees during blossoming time. A large proportion of the honey crop was used by the industries in baking, ice cream and syrup. The prices of honey to general consumers continued at near the levels of 1942 when they were about double the year 1941. A large part of the comb honey was sold locally near the point of production The price of the fine California white orange honey ranged much higher than that of clover and buckwheat honey. (J. C. Ms.)

Beer: *see* BREWING AND BEER.

Beers, Clifford Whittingham (1876–1943), U.S. pioneer in the mental hygiene movement, was born March 30 in New Haven, Conn. He entered business after graduating from the Sheffield Scientific school, Yale, 1897, but suddenly at the age of 24, suffered from a delusion that he was developing a serious disease and leaped from a fourth-story window. He survived, was committed to a sanitarium and spent the next three years in asylums. He was pronounced cured and released in 1903 and immediately set about to improve conditions for the insane and mentally ill and launched a mental hygiene movement. His book, *A Mind That Found Itself* (1908), describing his bitter experiences during his confinement in institutions, reached its 24th edition in 1939. It resulted in institutional reforms throughout the world. He organized the Connecticut Society for Mental Hygiene, 1908, the first of its kind, and similar societies on a national and international scale. Beers died in Providence, R.I., July 9.

Belgian Colonial Empire. The accompanying table gives material relative to the colonial and mandated territories administered by Belgium (*q.v.*). Total area 948,000 sq.mi.; total population (est. Dec. 31, 1939) 14,131,000.

History.—In Jan. 1943 the state department of the United States announced an agreement with the Belgian government which would bring Congo supplies to the United States under "Lease-Lend in reverse," with retrospective effect from June 1942.

The production drive continued under growing difficulties. Colonists feared that unless larger shipments of machinery spares and tools were forthcoming, output would drop. A less obvious need was better supplies of cheap goods for the native trade. When trading stations have little or nothing to offer the Negro labourer in exchange for his paper-money wages, he becomes suspicious and recalcitrant. Any serious labour trouble had to be avoided at all costs, to maintain the Congo's output of vital raw materials for war factories. The U.S. Economic mission under Hickman Price was grappling with this import problem.

Provisional output figures for 1942 included 5,500,000 carats diamonds (mainly industrial), and (in metric tons): 168,000 copper, 28,000 zinc concentrates, 27,000 manganese, 28,000 tin ore, 1,800 cobalt, 269 tungsten ore, 126 tantalo-colombite, 80,000 palm oil, 40,000 cotton. (W. FOR.)

Belgian Congo: *see* BELGIAN COLONIAL EMPIRE.

Belgium. A country of Europe, occupied by German troops in May 1940; area 11,775 sq.mi.; pop. (est. Dec. 31, 1939), 8,396,276; chief towns (pop. Dec 31, 1938): Brussels and suburbs (cap. 912,774); Antwerp (273,317); Ghent (162,858); Liége (162,229). Ruler: King Léopold III; prime minister (in exile): Hubert Pierlot; languages: French and Flemish; religion: Christian (mainly Roman Catholic).

History.—Forced deportation of Belgians to work in German factories continued during 1943, despite vigorous protests from the king, the clergy and the justices. There were no reliable statistics of the number deported, but it was certainly high in relation to the total population; estimates based only on admissions made by the Germans themselves in the Brüsseler Zeitung reached 430,000.

Sabotage was still widespread. Further evidence of the seriousness of the explosion which occurred in 1942 at the Tessenderloo chemical works came from Switzerland, where the underwriters paid out 2,045,000 Swiss francs. Savage reprisals follow every attack. Léon Degrelle, leader of the small Rexist (fascist) party, said in May 1943 that 518 "terrorist criminals" had been shot since the beginning of the year. No fewer than 151 secret newspapers were published, some in French, others in Flemish, representing every political opinion in the country from the Catholic party to the Communists.

The serious food shortage was favouring the spread of disease, the energy value of the official daily ration being only about 1,230 calories, against a minimum of 2,000 required to maintain health. The U.S. Board of Economic Warfare received information that a third of the 2,300,000 Belgian children under eighteen were consumptive.

Industrial activity generally was at a low ebb, owing to the deportation of skilled workers and also to an acute shortage of raw materials normally imported from overseas. This was true even where the Germans have pressed to restore output, as in

Belgian Colonial Empire

the locomotive and railway car works. Exceptions were electrical engineering, which was working at capacity under the eyes of German experts, and the rayon industry, into which German capital had been injected. Early in 1943 a new staple fibre factory near Ghent started work, using German beechwood as the chief raw material. Output was expected to reach 40 tons a day by the end of 1943.

The output of coking coal from the Campine field had been pushed up successfully to replace part of the former imports from England, but total output of all grades of coal appeared to be several million tons below pre-war level.

In Oct. 1943 the Belgian and Dutch governments (in London) made a currency agreement to promote postwar trade between the two countries. The rate of exchange was fixed at 16.52 francs (3.304 belgas) to the florin, and currency of either country would be made available to the other as required to finance imports.

(W. For.)

Education.—(1938) Primary schools 8,712; scholars 955,038; higher schools 273; scholars 86,279; universities (1937–38) 4; students 10,776.

Banking and Finance.—Revenue, ordinary (est. 1941) 12,159,600,000 francs; expenditure, ordinary (est. 1941) 12,003,000,000 francs; public debt (Dec. 31, 1939) 59,318,300,000 francs; notes in circulation (July 31, 1942) 58,537,000,000 francs; gold reserve (July 31, 1942) 21,677,000,000 francs; exchange rate (average 1940): belga = 16.88 cents.

Trade and Communications.—External trade (merchandise): imports (1939) 19,426,000,000 francs; exports (1939) 21,580,000,000 francs.

Communication and Transport.—Roads, suitable for motor traffic (1939) 6,571 mi.; railways, open to traffic, main (1939) 3,190 mi.; airways (1938), distance travelled 1,457,050 mi.; passenger mileage 8,255,980 mi.; baggage mileage 156,762 ton mi.; mail mileage, 78,412 ton mi.; newspapers 52,504 ton mi.; shipping (July 1, 1939) 408,418 gross tons; tonnage launched (July 1938–June 1939) 27,600 gross tons; vessels entered, in net tons, (monthly average 1938) 2,497,000; (July 1939) 2,801,000; cleared (monthly average 1938) 2,502,000; (July 1939) 2,803,000; motor vehicles licensed (Dec. 31, 1938): 155,174 cars; 77,600 commercial; 67,016 cycles; wireless receiving set licenses (1938) 1,082,200; telephone subscribers, local (1938) 287,323.

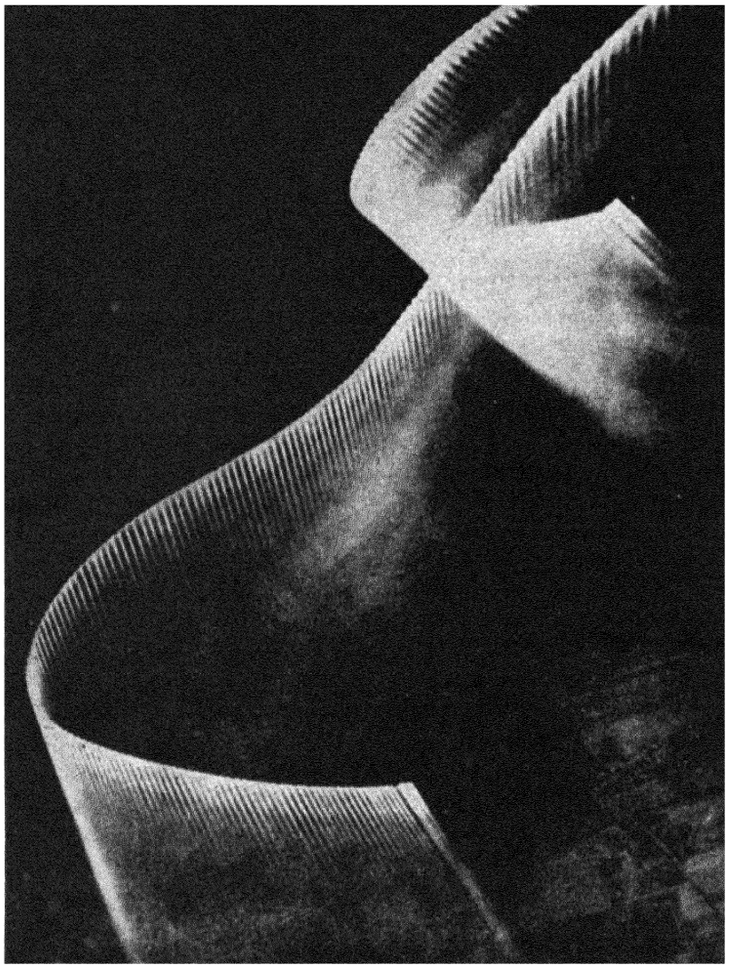
Agriculture, Manufacturing, Mineral Production.—Production 1939 (in metric tons), wheat 349,000; oats 724,200; rye 349,400; potatoes 3,323,200; coal (1940) 25,605,000; pig iron and ferro alloys 3,059,000; steel 3,104,000; beet sugar (1940) 231,000; barley 51,000; butter 61,000; margarine 60,700; artificial silk 5,900. Industry and labour: industrial production (1929 = 100) average (1939) 83.3; (Jan. 1940) 79.1; number wholly unemployed (average 1939) 195,211; (March 1940) 163,598. (*See* also Belgian Colonial Empire.)

Benefactions: *see* Donations and Bequests.

Benét, Stephen Vincent (1898–1943), U.S. poet and author, was born July 22 in Bethlehem, Pa., the younger brother of William Rose and Laura Benét, both well-known poets. When a freshman at Yale, he had his first book published, *Five Men and Pompey* (1915). After taking his M.A. from Yale in 1920, he went to live in France on a Guggenheim fellowship and there wrote his greatest epic, *John Brown's Body* (1928), a long narrative in verse of the Civil War, which won the Pulitzer prize as the best volume of verse for that year. More popularly known was his short story, *The Devil and Daniel Webster* (1937), a fantasy on the Faust theme, built around the life of the New England statesman. The story won an O. Henry award, was dramatized and appeared in a screen version. At the outbreak of World War II, Benét abandoned work on another long epic poem, *Western Star,* to write anti-fascist propaganda for government agencies, including the *Prayer for United Nations.* In his poetry and fiction, he dealt mainly with the U.S. scene, writing with vigour, drama and humour. Benét died in New York city, March 13.

Benton, William (1900–), U.S. educational administrator, was born April 1 in Minneapolis. Both of his parents were educators. After taking the A.B. degree at Yale university in 1921, he entered the advertising agency business. In 1929 he and Chester B. Bowles founded the Benton & Bowles advertising agency, which became in a few years one of the largest in the field. In 1936 Benton retired from the chairmanship of the agency, and in the following year became vice-president of the University of Chicago. At the university Benton had two main interests, one in economic problems, the other in the development of new instruments for education.

In 1943 Benton was vice-chairman of the board of trustees of the Committee for Economic Development, a group of business leaders who were studying ways and means of achieving maximum employment and productivity after the war and were encouraging business and businessmen throughout the nation to formulate postwar plans. In this capacity, Benton visited England in Aug. 1943 to discuss postwar business with British industrial and trade leaders. Benton was also associated with Nelson Rockefeller in the latter's work as Coordinator of Inter-American Affairs, and served as vice-chairman, under Eric Johnston, of the U.S. Commission of Inter-American Development.



As a result of his interest in the wider use of radio, motion pictures and publications in education, Benton was responsible for the policy and planning of the University of Chicago's two network radio programs, the Sunday "Round Table" on NBC, and "The Human Adventure" on the Mutual system Thursday evenings.

When the Sears, Roebuck Co. gave Encyclopædia Britannica, Inc., to the University of Chicago in 1943, Benton became chairman of the board of Britannica. At his instance the Britannica company in 1943 acquired from Western Electric Co. the largest producer of classroom motion pictures, Erpi Classroom Films, Inc., now known as Encyclopædia Britannica Films, of which he also became chairman. Benton also has business interests in New York.

Bentonite. The production of bentonite in the United States increased from 354,028 short tons in 1941 to 374,967 tons in 1942, of which 40% went into foundry and core sands, 31% in oil refining, and 13% in oil-well drilling. The Wyoming-South Dakota area accounted for 61% of the total tonnage and 76% of the total value. (*See* also Fuller's Earth; Mica.) (G. A. Ro.)

Bequests, Philanthropic: *see* Donations and Bequests.

Berlin. The residence of Hohenzollern electors, kings and emperors from 1442 to 1918, and capital of the German reich after 1871, Berlin is the largest and most important city of Germany. Reorganized in 1920 to include several suburbs, greater Berlin in 1939 had an area of 332 sq.mi., and a population of 4,332,000. Its favourable situation in north Germany on the River Spree, between the Elbe and the Oder rivers, affords it cheap water transportation through Germany's wide-reaching system of rivers and canals. It is also the centre of Germany's network of railways, motor highways and commercial air lines.

PATTERN OF GERMAN SEARCHLIGHTS during an Allied raid over Berlin in 1943. Each track of light is made up of little waves caused by the vibration of the plane

Politically important as the seat of the Prussian and German governments, it grew rapidly after 1860 as an industrial and banking centre. In World War II it became the focal point of the vast nazi organization for the economic exploitation of Europe.

During 1943 the capital was subjected to a score of devastating bombing raids by British and American planes which started large fires and destroyed a considerable part of the city. The central part where government offices and business houses are located and the industrial plants in the suburbs were especially severely attacked. (S. B. F.)

Bermuda. An island group and colony of Great Britain, 580 mi. off the North American coast at lat. 32° 15′ N. and long. 64° 50′ W. It has an appointed governor and elected representative assembly. Area: 19 sq.mi.; pop. 32,451 (official est. Dec. 31, 1941) not including military personnel of various types. The capital is Hamilton (pop. 3,217). In the first part of the year the governor was Viscount Knollys; he was replaced on Aug. 24 by Lord Burghley.

History.—While the war continued to affect Bermudian economy, increased shipping early in 1943 brought in large consignments of supplies, so much so that, on occasion, storage became something of a problem. Occasional shortages of items such as milk occurred. Rationing and price control remained in effect, with the latter being expanded. The financial condition of the colony remained satisfactory, but the prospective completion of defense construction foreshadowed a slump; as part of the tax program proposed to meet the decline in government income an income tax was introduced, but it was rejected by the assembly in June. Some departures of civilian labourers were noted, also a growing scarcity of farm labour. In May a war refugee conference brought British and U.S. representatives to the islands; the short report made by the body, issued May 9, made some recommendations but held that the general problem of refugee aid must remain subordinated to the war effort. The first divorce law in the colony's history was enacted early in 1943.

Education.—At last report (1941) Bermuda had 29 government schools with an enrolment of 5,182. Small fees are charged and attendance is compulsory. During 1943 the assembly voted £20,000 for school construction.

Finance.—The monetary unit is the pound sterling (value in 1943, approx. $4.03½ U.S.). The yearly budget was balanced at £600,000; one item was a heavy increase in liquor taxes. By Oct. 31 it was estimated that the revenue for 1943 would approximate £742,816. Currency in circulation early in the year was £750,000 (prewar normal amount: £200,000) and there was concern over inflation. During the year an interest-free loan of £607,400 was floated for aid to Britain.

Trade and Resources.—Imports in 1942 were down, and consisted mainly of foodstuffs (value in 1941: £2,422,106; 1940: £1,469,504). The 1942 fish catch totalled 512,000 lb. (1941: 170,000 lb.), and 6,000 lobsters were caught as against 2,500 in 1941. Other 1942 production: potatoes, 101,000 bu. (85,000 bu. in 1941); miscellaneous vegetables, 255,000 bu. (200,000 bu. in 1941); eggs, 499,000 doz. (260,000 doz. in 1941); milk, 670,000 gal. (1941: 900,000 gal.), lily bulbs, 1,955,000 (1,500,000 in 1941). Tourist trade remained almost nonexistent, but transatlantic air travel continued heavy.

Communication.—A main station for transatlantic air travel, Bermuda found this activity so great in 1943 that in midyear an Airport board was created to govern traffic and supervise airports and equipment. The traditional Bermudian restriction to horse-drawn vehicles on the 120 mi. of island roads seemed doomed with the adoption, in the summer, of a legislative report favouring an increased use of motor vehicles after the war. Shortage of fodder was responsible for a reduction of the number of horses in the islands (1,300 in 1941; in 1942, 1,079).

Bernie, Ben (1891?–1943), U.S. orchestra leader and actor, was born Benjamin Anzelevitz in New York city. Son of a blacksmith and one of 11 children, he was given violin lessons and at the age of 15 made his debut at Carnegie hall. Later he toured the country playing in small vaudeville houses. In the "jazz era" which followed World War I, he acquired a dance band, called himself the "Old Maestro" and played to dance patrons in night clubs of New York city and Chicago. Bernie eventually became one of the highest paid entertainers in the United States. He died in Beverly Hills, Calif., Oct. 20.

Beryllium. The United States output of 158 short tons of beryllium concentrates in 1941 was increased in 1942, but figures were not available for publication. Imports continued to be the main source of supply. War uses greatly increased the demand, and systematic efforts were being made to increase the domestic supply in order to reduce the necessity for imports from Brazil and Argentina. World production was reported at 4,014 short tons of ore in 1941 and 1,780 tons in the first half of 1942; Argentina and Brazil were the leading producers. Extensive exploratory work was being done in the United States to increase the small domestic output. Imports in 1942 were expected to be about double the 2,816 tons received in 1941. (G. A. RO.)

Bevan, Arthur Dean (1861–1943), U.S. surgeon, was born Aug. 9 in Chicago. He studied at the Sheffield Scientific school at Yale and took his M.D. degree from Rush Medical college, Chicago, in 1883. He joined the U.S. marine hospital service in 1883 and concurrently held a professorship in anatomy at Oregon State university. He later taught anatomy and surgery at Rush Medical college, and was named head of the college's surgical department in 1907. He was also professorial lecturer on surgery at the University of Chicago. Dr. Bevan was president of the American Medical association, 1917–18, and during World War I was director general of surgery in the U.S. surgeon general's office in Washington. He died in Lake Forest, Ill., June 10.

Billiards. Throughout 1943, billiards suffered from a wholesale lack of competition. There were only two championship contests. One was a challenge match between Willie Mosconi of Jackson, Mich., and Andrew Ponzi, Philadelphia veteran, who had twice previously held the title. Mosconi, who had annexed the crown in a tournament at Detroit the previous year, and Ponzi, the 1942 runner-up, clashed at Kansas City, Mo., in April. It was a 1,250-point struggle, and Ponzi dethroned the youthful Mosconi, 1,250–1,050.

In December at Rochester, N.Y., Ponzi again engaged in a challenge match for the championship, meeting Irving Crane of Livonia, N.Y., former titleholder. Ponzi emerged on top, defeating the challenger, 1,000–924, and thereby retaining the crown.

Otherwise, the sport was dormant. In the absence of competition, the three-cushion championship of the world remained in the possession of Willie Hoppe of New York, who finished on top the last two times the tournament was held. Hoppe devoted most of the year to a tour of service camps throughout the country, entertaining troops. (L. EF.)

Binyon, Laurence (1869–1943), British poet and art historian, was born Aug. 10 at Lancaster. Best known for his ode *For the Fallen,* written during World War I, Binyon was the author of some 20 volumes of poetry. His last work was *The North Star and Other Poems* (1941). Long associated with the British museum, Binyon was widely recognized as an art historian and expert on Asiatic art. He was Norton professor of poetry at Harvard university, 1933–34, and Byron professor of poetry at the University of Athens, 1940. He died in Reading, England, March 10. (See *Encyclopædia Britannica.*)

Biochemistry. **Nutrition and Vitamins.**—Among the ten "essential amino acids" previously found necessary for rat growth, two, namely histidine and arginine, were found to be unnecessary for maintenance of nitrogen equilibrium in man, while the other eight are necessary and sufficient. While this indicates that histidine and arginine may be unnecessary in human nutrition, this point cannot be considered proved as long as their importance for *growth* of humans, or for *nitrogen equilibrium* in rats remains unknown. For the maintenance of nitrogen equilibrium in dogs, histidine is less important than tryptophane.

Among the metabolic relations of vitamins, riboflavin, like pyridoxin and nicotinic acid, was found to be essential for haemoglobin formation in the dog. The nature of the anaemia of nicotinic acid deficiency was studied in detail. Pyridoxin deficiency has no effect on catalase activity of tissues. Studies on the effect of environmental temperature on the requirement of B vitamins showed that the requirement of thiamin is doubled, and that of choline is increased seven-fold by exposure to hot, moist (tropical) atmosphere, while the requirements of riboflavin, pyridoxin, inositol, para-aminobenzoic acid, and niacin remain unaltered. The inhibition of growth of rats caused by feeding poorly absorbed sulfonamides was traced to an inhibition of bacterial vitamin synthesis in the gut and was counteracted by liver concentrates, p-aminobenzoic acid, biotin, and folic acid concentrates. These sulfonamides have thus become an important tool in causing vitamin deficiencies in animals, and in distinguishing between vitamin synthesis by bacteria in the gut and vitamin synthesis in tissues of animals.

The value of urea as a partial substitute for food protein was demonstrated in dairy cattle. When quantities equal to 25% of the total nitrogen intake were fed as supplement to an otherwise inadequate diet, nitrogen balance, body weight and milk production were maintained in five of seven animals, while one animal showed no benefit from urea feeding.

Metabolism.—Studies with compounds containing stable and radioactive isotopes continued to provide new and fundamental information. The first evidence of the role of cholesterol as a precursor of other body steroids was found following the preparation of deutero-cholesterol. The biological conversion of this sterol to cholic acid was demonstrated and the fact that at least two thirds of the cholic acid has its origin in cholesterol, indicates that this may well be the sole source of this bile acid. The feeding of deutero-n-hexadecane in very small doses resulted in the recovery of fatty acids containing excess deuterium in the tissues; this showed that paraffin, to a minute extent at least, is a food.

Studies on the biological origin of purines and pyrimidines using various metabolites containing N^{15} showed that ammonia nitrogen is rapidly converted into purines and pyrimidines of the nucleic acids of tissues, and also of the uric acid and allantoin of urine. Accordingly, purines and pyrimidines belong to that large group of substances whose nitrogen is being rapidly replaced at all times. Among the three likely purine precursors, the imidazol group of histidine, the guanidine group of arginine, and urea, none is available for purine or pyrimidine synthesis. The synthesis of thyroxin by thyroid tissue was studied with the aid of radioactive iodine, I^{131}. It was found that the incorporation of I^{131} into thyroxin and diiodotyrosine by surviving thyroid tissue, is dependent upon the intactness of tissue structure (homogenization disrupts the process), upon adequate O_2 tension, and that it is inhibited by cyanide azide, CO, and other cytochrome-oxidase inhibitors. Studies on nitrogen fixation with the aid of N^{15} showed that this phenomenon is not so widely occurring as was formerly supposed. It is readily found for the free living nitrogen fixing bacterium, *Azotobacter vinelandii,* the blue green alga, *Nostoc muscorum,* the anaerobic bacterium, *Clostridium pasteurianum,* inoculated red clover plants, and excised root nodules of the pea plant; however, it could not be demonstrated for germinating peas, excised root nodules of leguminous plants, free living *Rhizobium,* and cell free preparations of *Azotobacter.*

The origin of urinary ammonia was traced to glutamine; urea and amino acids are excluded. A beginning was made toward an enzymatic interpretation of the effect of the adrenal hormones

in carbohydrate and protein metabolism. Adrenalectomy, even more than hypophysectomy, causes a marked decrease in arginase activity of rat livers; while the administration of corticosterone and certain other ll-oxy adrenal steroids, but not desoxy-corticosterone, cause increases in liver arginase.

Penicillin.—In addition to the ether soluble, nitrogen containing, organic acid called penicillin A or notatin, a second, even more powerful and more widely effective antibacterial substance was separated, which is insoluble in organic solvents, and is designated penicillin B or penatin. It was shown to be a heat labile flavoprotein enzyme, which converts glucose plus oxygen into gluconic acid and hydrogen peroxide, and the liberation of this last substance was shown to be the basis of its antibacterial action. This enzymatic peroxide formation as a basis of bacterio-static action is a new idea.

Competitive Inhibition in Biochemical Processes.—Increasing attention was paid to biological inhibition by synthetic compounds which have structural similarity to natural compounds of great biological activity, like vitamins and hormones. Classical examples are the inhibition of succinic dehydrogenase by malonate, and the antagonism between sulfanilamide and p-aminobenzoic acid in the growth of bacteria. A more recent example is the production of thiamin deficiency by the feeding of a pyridine analogue of thiamin. From the structural similarity of local anaesthetics like cocaine, procaine, etc., to acetyl choline, a theory was advanced involving the idea of competition between these two kinds of compounds for the receptive substances in the nerve endings. A quantitative theory of synergism and antagonism among diverse inhibitors was developed, with special reference to the inhibition of bioluminescence by sulfanilamide, and to the antagonisms of this inhibition by urethane, p-aminobenzoic acid, glucose and other substances.

Cancer.—From Warburg's laboratory in Berlin-Dahlem came the report that the plasma of tumour rats contains about eight times as much zymo-hexase (2.3 μg per cc) as that of normals. This increase depends upon the presence of a tumour greater than 2% of the body weight. The plasma of pregnant rats has a normal zymo-hexase content. In human cancer the values were normal, perhaps because the tumours were not sufficiently large. Tumour tissue has a higher zymo-hexase content (87 μg per cc) than most other tissues, but muscle tissue (1460 μg per cc) has the highest, and it is thought that the most likely source of the increased zymo-hexase of the tumour plasma is some abnormality which liberates the enzyme from the muscle cells. Birch, Reginald Bathurst (1856–1943), U.S. artist and illustrator, was born May 2 in London. He went to San Francisco in 1872 and worked with his father on theatrical posters. He later spent eight years studying at the Royal academy in Munich. When he returned to the U.S. his illustrations found an immediate sale in leading magazines. His fame, however, rested on one of his earliest creations, a golden-haired child in black velvet suit and white lace collar that he drew for Frances Eliza Hodgson Burnett's *Little Lord Fauntleroy* (1886). Years later, commenting on its fame, the artist said ruefully: "There is one of my early crimes for which I am still making expiation." Many of his illustrations appeared in a volume called *Reginald Birch—His Book* (1939), edited by Elisabeth B. Hamilton. He also produced many pen and ink drawings for the works of Frank Stockton, Ogden Nash, Mrs. Laura E. Richards and Louis Untermeyer. He died in the Bronx, N.Y., June 17.

Birth Control. The Planned Parenthood Federation of America, Inc., formerly the Birth Control Federation of America, Inc., made marked advances in 1943, concentrating on five programs of activity.

Public Health.—Five more states initiated co-operative efforts with the federation to include pregnancy spacing in their public health services—bringing the total number of states to eleven. The federation became a member of the National Health Council.

Clinical Service.—On Dec. 1, 1943, birth control services totalled 786; 211 in hospitals; 286 in public health quarters; 288 extra-mural; 372 of the total supported in whole or part by public funds. Services for treatment of sterility were listed in the federation's Clinic Directory.

Industrial Hygiene.—Absenteeism, due often to pregnancy or induced abortion, became an acute problem in many areas, as millions of women went into war work. The division of industrial hygiene, U.S.P.H. service, recommended, in an outline for use in industry, that "advice on the proper spacing of children, as a means of protecting the health of the mother and her children," be given married women workers, by counsellors in plants. Dr. Eva Dodge, the federation's assistant medical director, surveyed a number of plants, and, in co-operation with the Alabama state health department, assisted in preparing two pamphlets on this problem, for use by workers and management. A radio transcription, "Freedom From Fear," dealing with the problem of absenteeism, due to pregnancy, was produced by the federation for use of its state leagues.

Education. *Medical.*—Over 11,000 copies of Dr. Robert L. Dickinson's pamphlet, "Techniques of Conception Control," were sent on request to physicians, bringing the total to 56,000 issued on request to this group, and 17,000 were sent to registered nurses on request.

Birth control training institutes for public health nurses were held in Florida, Delaware and North Carolina.

Research.—Although no new discoveries were made during 1943, a special committee of the council on pharmacy and chemistry of the American Medical association continued research in chemical contraceptives, and the council on physical therapy initiated a co-operative program dealing with mechanical articles and devices. Reports appear in the *Journal of the American*

Medical Assn. for Dec. 18, 1943.

Social Work.—A new pamphlet, "The Case Worker and Family Planning," was sent upon request to 2,000 social workers. The federation participated, as a kindred group, in the National Conference of Social Work. A newly formed advisory committee directed work in this field.

Negro Program.—The division of Negro service, with its advisory council of 46, and sponsoring committee of 146 members, representing national professional, medical, religious and civic leadership, was strengthened, and a pamphlet, "Better Health for 13,000,000" published, reporting on the program of family planning for Negroes.

Religious.—The National Clergymen's Advisory council was organized with almost 1,000 members from 46 states. Organization of the council and election of officers were undertaken, and a pamphlet on "Marriage Counsel" for use of the clergy published.

Teaching in Medical Schools.—To stimulate better teaching of contraception in medical schools, Dr. W. E. Brown of Cincinnati Medical school visited 26 grade A colleges for the federation, finding some teaching of the subject in each. His teaching syllabus was distributed to grade A schools throughout the U.S., 45% of which were giving some instruction in 1943.

State Organizations.—In 9 affiliated states, Maryland, Delaware, West Virginia, Virginia, Florida, Iowa, Minnesota, Tennessee and Missouri, programs were broadened and strengthened by addition of professional staff members and executives. One more state, Ohio, became affiliated, bringing the total to 34.

Legal.—The U.S. supreme court refused to review the Tileston case involving the right of Connecticut doctors to advise contraceptives where life or health was threatened.

Massachusetts Referendum.—Although over 500,000 votes were cast in its favour, the referendum to amend the state law so that doctors might legally advise patients on contraception failed of passage.

International.—The war made organized work in occupied Europe impossible. In Great Britain educational work, clinical service and research were continued by the Family Planning association. In Australia the law passed in 1942 did not interfere with clinical work. Health boards in Bermuda planned wider dissemination of birth control information, to cope with the problem of overpopulation there.

Birth rates fell in most of Europe but were higher than in years in Great Britain. In the United States they were higher than for 20 years past. (*See* also BIRTH STATISTICS.)

(M. SR.)

Birth Statistics. According to provisional records, the number of births in the United States, Canada, and England and Wales was appreciably greater in 1943 than in 1942. For the United States and Canada, this established a rise for each year since the outbreak of the general war in 1939, while for England and Wales it marked the second year of successive increase. For the United States the provisional report showed that for the first nine months of 1943 there were 11.6% more births than for the same period of 1942. The gains were greatest in the Pacific coast and mountain states, the increases for these areas being 18.6% and 12.6% respectively; the west south central states had the smallest gain. During the entire calendar year 1942 there were recorded 2,807,445 births in the continental United States, with a birth rate of 20.9 per 1,000 total population. In Canada, cities of 10,000 or more had about 11% more births during the first nine months of 1943 as compared with the same period of 1942. During the entire year 1942 there were 271,981 births in Canada and the birth rate was 23.4 per 1,000 population. Births in London and the great towns of England and Wales were 9.4% more during the first nine months of 1943 than during the like period of 1942. There were altogether 654,039 births in England and Wales in 1942, the birth rate being 15.8 per 1,000 population.

While the United States, Canada, and England and Wales experienced increases in birth rates, the war adversely affected the rates of Germany and Italy. Thus, Germany had a birth rate of 20.4 per 1,000 in 1939, whereas the figure for 1942 was only 15.2. Over the same years, the birth rate for Italy fell from 23.5 to 20.2.

The rapid upswing in the birth rate of the United States in 1942 and 1943 radically altered the usual seasonal sequence in births. Ordinarily, births run to a minor peak in spring and a major peak in summer, with the low point for the year in December. During 1942 the peak for the year fell in October, with December the second highest point. These unusual peaks may possibly be related to the United States entry in the war in Dec. 1941, which undoubtedly hastened many contemplated marriages and also induced many already married to establish families. There were signs of a slackening in the rate of increase of births from 1942 to 1943. Although there was an 11.6% increase over the corresponding nine-month period ending in September, the increase for the month of September alone amounted only to 3.1%.

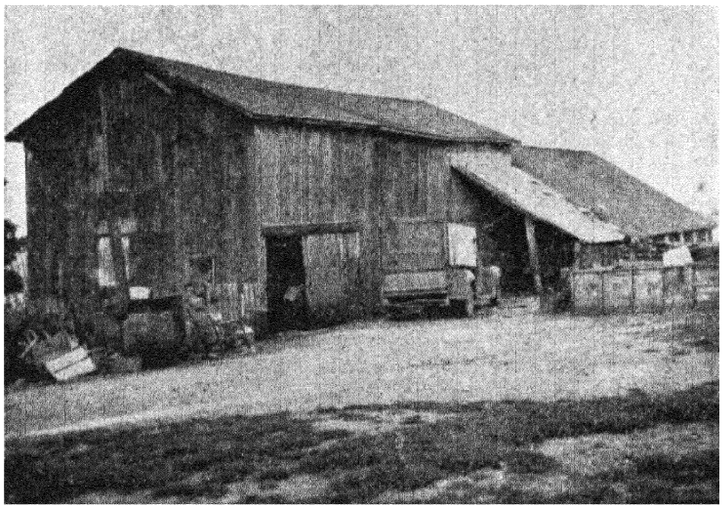
By virtue of the rise in the birth rate of the United States from its low point of 16.6 per 1,000 population in 1933, the country had an additional 2,000,000 babies born in the ten-year period since then. Of this total, the excess of the birth rate in 1941 over that of 1933 contributed about 280,000 babies, the excess of 1942 an additional 560,000, while the contribution for 1943 amounted to more than 650,000.

After an examination of existing literature bearing upon the question whether the ratio of males to females at birth increases in wartime, C. Panunzio in the *Milbank Memorial Fund Quarterly* (July 1943) concluded that there was some evidence, not wholly conclusive, indicative of such an increase.

In *Vital Statistics—Special Reports*, vol. 18, p. 324 (April 1943), the bureau of the census published the first of its studies on the completeness of birth registration in the United States. These studies are based upon a comparison of the census returns of infants on April 1, 1940, with the birth and death certificates filed during the four-month period from Dec. 1, 1939 and the census date. The report cited showed that during the test period, 92.5% of the actual births in the United States were duly registered. For white births, registration was 94.0% complete and for all other races it was 82.0%. In cities of 10,000 or more, the completeness of birth registration was 96.9%, while for smaller cities and rural areas, the figure was only 88.0%. On the whole, registration was most complete in the states of the northeast and on the Pacific coast, the poorest showing being made in the south central states.

Practically all births of white children in the United States are attended by a physician, but only half of the births of Negro children are so attended. Thus, in 1941, among white births,

65.7% were attended by a physician in a hospital, 31.2% by a physician elsewhere, 2.7% by a midwife, and only 0.4% otherwise. For Negro births, the corresponding percentages were 27.3, 23.4, 48.5 and 0.8.



An analysis of some social and psychological factors affecting fertility, based on the records of native white couples in Indianapolis, was presented by P. K. Whelpton and C. V. Kiser in the *Milbank Memorial Fund Quarterly*, July 1943. In summarizing the first results of the investigation, the authors found that fertility among Catholic couples was 18% greater than that among Protestants. On the other hand, mixed Protestant-Catholic unions were 10% less fertile than those of Protestants alone. Jewish couples were 25% less fertile than Protestants, but this finding is based upon a small sample. The authors also found confirmation of the usual relation that fertility decreases with advance in socio-economic status, whether measured in terms of rent paid (or the equivalent rental value for homeowners) or educational attainment of husband and wife. An exception noted in the upper rental brackets is accounted for by the greater fertility among homeowners, for fertility rates remain low among those in this bracket who rent their homes. The variation of fertility with socio-economic status was found to be much less marked among Catholic unions than among Protestants. There were definite indications that the excess of the fertility of Catholic couples over Protestant couples tends to become smaller with descent in socio-economic status. The authors announced their intention to present further reports on their findings. (*See* also CENSUS, 1940.)

Bismuth. The chief producers of bismuth are the United States, Peru, Mexico and Canada, but no specific information on current developments was received from any of these countries. The nearest approach to production statistics was a statement that the Peruvian exports in the first quarter of 1943 were about a half greater in value than in the same period of 1942. (*See* also METALLURGY.) (G. A. Ro.)

Black Markets. Black markets, the title bestowed upon those illicit areas of wartime commerce where articles are bought and sold in defiance of official price and rationing controls. The etymology of the term, as of the continental *marché noir* which already flourished in World War I, is doubtless to be sought in comparable expressions denoting forbidden activities carried on in dark secrecy to escape detection and punishment, *e.g.*, "black bourse," "black mass," "black hand." In the United States during 1943 the federal government conducted a large-scale public information campaign to heighten popular awareness of the evils of the "black market," which was defined as comprehending all types of illicit activity undermining wartime price and rationing restrictions. The term "black market" has thus come to have a very broad signification in the United States.

Black market activities in the United States antedated the country's entry into the war against the axis. During 1941, as the prewar defense program proceeded apace, shortages developed in essential industrial articles, notably fabricated iron and steel,

ALLEGED BLACK-MARKET MEAT SLAUGHTERHOUSE discovered near Chicago by government agents in the summer of 1943

machine tools and lumber; a thriving trade was carried on in such articles at double and triple the ceiling prices established under presidential order. The alarm occasioned in official quarters by these early but full-blown symptoms of an inflationary spiral, and the lack of statutory sanctions to curb this black market vanguard spurred the enactment of comprehensive legislation early in 1942 establishing nation-wide price and allocation (rationing) controls. Black markets sprang up in the train of new price ceiling regulations and rationing orders. Serious difficulties were experienced in the initial consumer-rationing programs—sugar, gasoline, coffee, fuel oil, rubber tires. Housewives foolishly allowed themselves to be stampeded into hoarding sugar and coffee; organized bands of professional criminals counterfeited gasoline and fuel oil ration stamps and cached precious stores of tires obtained by outright theft or overceiling cash payments. However, these troubles were dwarfed by those which followed the institution of comprehensive food controls, made possible for the first time after adoption of supplementary legislation in Oct. 1942.

The new controls were imposed at a time when growth of demand and reduction of civilian supply had resulted in extremely serious inflationary pressures. The crisis broke first in fresh meats. Enormous quantities of meat were unlawfully diverted by packers who disregarded official slaughtering quotas and by wholesalers and retailers who bought up supplies from these and other illicit sources. Early in 1943, as the U.S. began to seethe with alarm over the virtual disappearance of meat from many large population centres, and with the condition being widely misinterpreted by press reports and rumours as resulting from an infiltration of gangsters into the meat industry and a renascence of cattle rustlers in the west, vigorous enforcement steps were taken by the government. Within a period of three months more than 25,000 persons were investigated and some 1,000 prosecutions were brought against violators of both slaughtering quota restrictions and price controls. All but a very small number of these cases terminated in favour of the government. Because of an increased demand for poultry consequent upon the rationing of meat, a mushrooming of illicit poultry trade went hand in hand with the meat black market. Poultry quickly disappeared from many legitimate urban markets, and supplies normally purchased by the armed services became unobtainable in a number of eastern states. A nation-wide drive was carried out to end black market transactions in poultry by raisers and sellers and by itinerant hucksters who scoured the countryside for supplies. Some 350 prosecutions were instituted. Army officials obtained needed supplies by requisitioning at ceiling prices live poultry shipments

seized by police officials on the open highways. As in the transference of black market activities from rationed meat to unrationed poultry, profiteers outdid themselves in fresh fruits and vegetables after canned and other processed foods were brought under control. A potato supply crisis in the spring of 1943 and later a similar onion shortage were aggravated by black market activities.

Official moves to stamp out particular black markets in the United States invariably succeeded whenever sufficient manpower could be concentrated for the purpose. The task of investigating violators and bringing them to justice demanded skilled and painstaking effort, particularly in the food and apparel industries where market structures were intricate and diversified. Unfortunately, in the United States the creation of an adequate professional enforcement organization met with serious budgetary handicaps. Late in 1943, as the immense administrative task of calculating simplified dollars-and-cents ceilings for thousands of consumers' articles was substantially advanced, as volunteer community enforcement panels were organized throughout the country, and as the statutory consumers' damage remedy won approval from high judicial authorities, it appeared that a significant strengthening of professional enforcement facilities at retail levels might come about. The national administration held to the view, however, that effective control of black markets both retail and wholesale could be accomplished only by combining adequate professional enforcement with the new program of community panels staffed by volunteers. (C. Bs.)

Blamey, Sir Thomas Albert (1884–), Australian army officer, was born in Wagga Wagga, New South Wales, Jan. 24. He joined the commonwealth military forces in 1906. During World War I, he served as chief of staff for the Australian corps and was awarded the D.S.O. After the war, he was with the Australian imperial force, and in 1920 became deputy chief of the Australian general staff. As Australian defense representative, he was attached to the war office in London, 1922–24, later becoming 2nd chief of the general staff of the commonwealth military force. He was commander of the Victoria police, 1925–37. With the approach of World War II, he accepted an appointment as controller general of the recruiting secretariat, 1938, and assumed command of the Australian army corps, 1940. He was soon transferred to the Australian forces in the middle east, and in 1941 was elevated to the position of deputy commander in chief of the British middle east forces. In March 1942, when the Japanese were threatening the entire Southwest Pacific, Sir Thomas returned to Australia to take command of the Australian armies serving under Gen. Douglas MacArthur and played an important role in the New Guinea campaign, 1942–43. With the rank of lieutenant general, Sir Thomas held command of the Allied land forces in the Southwest Pacific, second in command to Gen. MacArthur. He was knighted in 1919.

Bledsoe, Julius (Jules) C. (1898–1943), U.S. Negro singer and composer, was born Dec. 29, in Waco, Tex. He took his A.B. degree from Bishop college, Marshall, Tex., 1918, and later studied medicine at Columbia university. Gifted with a rich baritone voice, Jules Bledsoe was encouraged to further his musical training and consequently gave up his medical career to study voice in New York city, Chicago and Rome. Critics lauded his concert debut in New York in 1924, and in 1926 he was soloist in Boston concerts under the direction of Sergei Koussevitzky. He created the role of Tizan in the opera *Deep River* and reached nationwide popularity as a master of the spiritual style with his singing of *Ol' Man River* in *Show Boat* with the Ziegfeld company, 1927–29. He also appeared in the motion picture version of the same review. His compositions include the *African Suite* for violin and orchestra and several songs. He died in Hollywood, July 14.

Bohemia and Moravia. A protectorate of Germany in central Europe, formed in March 1939, after the dissolution and occupation of Czechoslovakia. Area, 19,058 sq.mi.; population, 7,000,000, almost completely Czech and Roman Catholic. President (1943): Dr. Emil Hácha. Capital: Praha (Prague). Chief cities: Praha (850,000), Brno (270,000), Moravská Ostrava (125,000), Plzeň (115,000).

History.—Little news penetrated from Bohemia and Moravia to the outside world in 1943. The Czech fascist movement, called Vlajka or The Flag, was disbanded and its property turned over to the German Red Cross. The movement had been founded in 1938 as a fascist party among the Czechs, but the German hopes of finding some support for a native fascist movement under the Czech population met with bitter disappointment. Under the Germans the Vlajka had been recognized as the only party allowed to hold public meetings, yet it failed to attract any support, and so had to be disbanded.

The German terror continued in Bohemia and Moravia during 1943. Most of the Jews were deported to eastern Poland or perished in concentration camps or were killed otherwise; the remainder, mostly old people, were all put into the small town of Terezín (Theresienstadt) which became the only recognized ghetto in Bohemia and Moravia and to which many Jews from Austria and Germany were also taken. The Czechs continued their movement of resistance and all their hopes were directed towards the Czechoslovak government established in London. (*See* also CZECHOSLOVAKIA; SLOVAKIA.) (H. Ko.)

Boisson, Pierre François (1894–), French government official, began his career with the French colonial service in 1920 as an assistant administrator of colonies. His rise was rapid, and in 1939 he was sent to French Equatorial Africa as governor general. After the fall of France in 1940, Boisson decided to serve Vichy as governor general of the vast French possession in Africa, and forces under his command turned back a Free French and British expeditionary force that attempted to land at Dakar in Sept. 1940. Boisson, it was reported, ruthlessly suppressed pro-Allied groups in French West Africa, and at one time it was charged that he gave haven to German submarines at Dakar. Boisson ruled with an iron hand until the landings of U.S.-British forces in Morocco and Algeria in Nov. 1942 virtually isolated French West Africa from Vichy and weakened Boisson's strategical position. As a result he agreed on Jan. 7, 1943, to support the Allies and promised them the use of men and materials. Gen. Charles de Gaulle, however, regarded Boisson as an opportunist and pro-Vichyite and dismissed him from office on the following July 3. Boisson was subsequently called to appear before a purge commission of The French Committee of National Liberation and was arrested on charges of treason, Dec. 21, 1943.

Bolivia. An inland republic of South America. Area: 419,470 sq.mi.; pop. (1941 est.) 3,457,000. The nominal capital is Sucre (est. pop. 32,000); the real seat of government is La Paz (est. pop. 280,000). Other cities (with est. pop.) are:

Cochabamba, 80,000; Oruro, 40,000; Potosí, 35,000; Santa Cruz de la Sierra, 30,000. Religion: Roman Catholic. President in 1943, until displaced by revolution on Dec. 20, 1943: General Enrique Peñaranda; president succeeding him: Major Gualberto Villarroel.

History.—Bolivia in 1943 became the second South American nation to declare war on the axis powers (Brazil was the first). The step was taken on April 7, while the vice-president of the United States, Henry Wallace, was in the country on a visit. The labourers of Bolivia had already been registered and had been given conscript status to the end that essential work in the mines and in agricultural enterprises would not suffer by loss of trained men to the army. In May, men in the professions were similarly listed. Censorship over all mediums of communication was established in the same month. Early in May President Peñaranda made a visit to the United States to further integrate the Bolivian effort with the inter-American war program; shortly after his arrival in the northern republic an announcement to the effect that economic co-operation between Bolivia and the United States would be intensified was issued. President Roosevelt also apologized for "excessive" rates charged Bolivia by U.S. bankers in the 1925–27 period. Other international developments during 1943 were an amicable agreement with Brazil for the exchange of raw materials (June 28) and a not-so-friendly interchange of comments with Chile over the perennial question of a Bolivian outlet to the Pacific.

Internal affairs were troubled throughout 1943. Serious controversy had been started by the use of military force in the suppression of a strike in the tin mines at Catavi in Dec. 1942, in which at least 20 miners were killed. Conditions in the mining area were investigated by a joint commission of U.S. and Bolivian experts, and reforms in regard to working conditions were recommended in its report. In succeeding months bitter attacks were made in the Bolivian congress on the administration of President Peñaranda for its policy in the Catavi strike. Both the National Revolutionary movement and the Leftist Revolutionary party opposed the administration. In September these charges forced the resignation of the cabinet.

On Dec. 20 a well planned revolution, led by Victor Paz Estenssoro of the National Revolutionary movement, overthrew the government and set up a new regime headed by Major Gualberto Villarroel. President Peñaranda was exiled. Although the new government announced that it would live up to all Bolivian commitments to the United Nations, the United States withheld recognition because of previous pro-nazi associations of the leaders of the revolution.

Education.—Bolivia had about 2,000 primary schools, with an estimated enrolment of more than 150,000, in 1941. The three universities have an unusually independent position. The 1942 budget allotted 125,420,000 bolivianos to education.

Finance.—The monetary unit is the boliviano, valued in 1943 at 2¼ cents U.S. ($.0236 U.S., controlled). National revenue (1942) was estimated at 1,104,518,300 bolivianos; expenditures at 672,402,400 bolivianos. Currency in circulation, on March 31, 1943, was stated as amounting to 1,737,400,000 bolivianos.

Trade and Communication.—Foreign trade (1941) amounted to: imports, 103,560,663 bolivianos; exports, 211,249,666 bolivianos (1940: 93,914,524 bs. and 174,181,877 bs., respectively). The United States took 60% of all exports in 1941 and supplied approximately 41% of all imports. The favourable trade balance of Bolivia with the United States for the first nine months of 1943 was $11,037,000 (merchandise and gold and silver). Imports from the United States were largely manufactures; exports to the United States were largely minerals; in 1942, however, Bolivia exported 1,486 tons of rubber, and on April 14, a rubber agreement was signed with the Rubber Development corporation in order to push production of this item. Bolivia imports both foodstuffs and fuel from near-by countries.

There is external communication by rail to Chile, Peru and Argentina. Some parts of eastern Bolivia have outlets by river boat to the Amazon and La Plata systems. Bolivia has found air service particularly useful, with Panagra and Lloyd Aéreo Boliviano (leased to Pan American Airways) giving service to all important cities and with outside countries. Railway mileage (1941) was over 1,360 mi. Some 6,000 mi. of highways exist. In the 1943 budget funds for road construction were reduced 50% over 1942.

Minerals.—Mining is the chief Bolivian industry and minerals form over 95% of her exports. Tin amounts to about 80% of exports, and was estimated at 38,900 tons in 1942 (in 1941, 42,887 tons). Other minerals exported were (1941 figures): silver, 228,576 kg.; tungsten, 2,874 tons; lead, 15,654 tons; zinc, 6,067 tons (12,197 tons in 1940); copper, 7,274 tons; gold, 254 kg. Petroleum production approximates 114,300 bbl. per year.

Book-collecting.

The rare book market enjoyed its biggest boom since the lean 1930s. The trend to higher prices affected even the ordinary second-hand and out-of-print items. It is significant that a copy of the Kelmscott Chaucer fetched £205 as against half that figure in 1941; it is even more significant that seven English county guides issued by the Shell Petroleum company (which can hardly be accused of trying to rig the book market), price half-a-crown each when new and in print, were knocked down to an unsentimental bookseller at 4*s.* 6*d.* a volume. The sharp falling-off in the number of American booksellers' catalogues reflected more than the concurrent shortages in labour and paper—books sold without the necessity for cataloguing them; it was essential simply for them to be on the shelves. Under a war regulation the British book-trade was required to charge home (not overseas) recipients of their catalogues an annual subscription price of one shilling. This seems to have kept up the quantity of British catalogues if not their physical quality. The London catalogues which, with their fine paper, wide margins, and superb plates once delighted hand and eye vanished for the duration.

Purchases by collectors from the occupied countries who went to America tended to broaden the base of the collecting pyramid. The incunabula market was livelier than in many years, and higher prices were recorded. But this condition was true in essence of every division of the printed book. Art and reference books soared, reflecting a collateral boom in the art market. The art and book collection of the late Condé Nast sold in New York for $118,406. A complete file of the *Burlington Magazine* (London, 1903-42) brought $525.

Unquestionably considerable buying was a hedge against inflation, and the *Times* (London) deplored the resurgence of "a kind of Stock Exchange mentality which does not serve the best interest of the rare book trade." On the other hand, much buying was by neophytes some of whom were undoubtedly drawn to books by the lack of consumer goods, and whose purchases were largely as unintelligent as they were uninspired—the phenomenon had been manifested before. A certain percentage of these newcomers was expected to remain within the fold, and some of them might well become the great collectors of tomorrow, so that the boom might turn out to have had its brighter aspects. Moreover

it was not marked by the speculative insanity of the 1920s.

Bibliographical research continued to cover a diverse field, but the fruits were in large part not scheduled for immediate appearance. The late Anthony J. Russo's bibliography of James Whitcomb Riley, completed by Dorothy R. Russo, was in the printer's hands. Publication of Jacob Blanck's *Selective Bibliography of Nineteenth Century American Juvenile Books* was postponed until after the war. The Moscow State Publishing House issued a bibliography of Russian translations of classics in English and of Russian critical comment thereon; it disclosed the interesting fact that there have been four Russian editions of Chaucer's *Canterbury Tales*.

Sales.—Auction sales fell off in number, and no great libraries came under the hammer, although there were several important offerings of literary and historical manuscripts and letters Owners of fine libraries which would in normal course have come on the market were obviously waiting for the graph of the price trend to define itself more sharply. The absorption of desirable books into permanent institutional collections continued, and had its persisting if indeterminate influence on values.

A complete series of plates for volume one of the original (1827) folio edition of John James Audubon's *Birds of America*, with some defects in the key wild-turkey reproduction, brought $3,900 at auction. Other representative figures (first editions unless otherwise noted) were as follows:

Audubon, *The Birds of America*, 1860 reissue of the elephant folio edition of 1827–38, $1,300; the same, first octavo edition, 1840–44, with one of 500 plates lacking, $350; T. E. Lawrence, *The Seven Pillars of Wisdom*, with autographs of Feisal and others associated with the desert revolt, $800; Jack London, *The Cruise of the Dazzler*, 1902, presentation copy, $175; R. L. Stevenson, *Travels with a Donkey in the Cevennes*, 1879, with the original drawing for the frontispiece, $400; Stevenson, *The South Seas*, 1890, one of 22 privately printed copies, $300; Stevenson, *The Beach at Falesa*, 1892, $425; Laurence Sterne, *A Sentimental Journey through France and Italy*, 1768, large paper, some defects, $190; Robert Burns, *Poems*, second (1788) American edition, George Washington's copy, with his autograph and bookplate, $1,100. (J. T. W.)

Borates. The production of borates in the United States in 1942 dropped to 226,723 short tons, a decrease of 32% from 1940. Consumption in enamels was cut heavily by lack of steel for stoves, refrigerators, cabinets, etc., and use in pottery glazes also declined. Glass, the major essential use, took increased amounts. (G. A. Ro.)

Boris III (1894–1943), king of the Bulgarians, was born Jan. 30 at Sofia, the eldest son of Tsar Ferdinand I and Princess Marie Louise of Bourbon-Parma. Boris ascended to the throne in 1918 after his father's abdication, successfully weathered a series of political storms during the troubled postwar period and entrenched his authority by using his police force to "liquidate" political foes. Boris paid only lip-service to parliamentary government during his entire career. In 1934, he approved a military coup d'état engineered by the "palace guard," who suppressed the constitution, dissolved parliament and banned political parties. A year later, Boris established himself as dictator, paid frequent visits to Hitler and Mussolini and geared his foreign policy to that of the two axis chieftains. He was forced to give German armies the right of transit across Bulgarian territory in Nov. 1940, and to join Hitler and Mussolini in declaring war on the United States in Dec. 1941. Boris refused, however, to declare war on the U.S.S.R., aware of the great sentimental attachment of his subjects for "Mother Russia." Boris' popularity waned as the war continued. Rioting in Sofia on May day, 1943, was so serious that he was compelled to flee the capital for his own safety. His death in Sofia on Aug. 28 was both unexpected and mysterious. An official communiqué said the king had died after a brief illness. But some Hungarian sources in Berne said the king was assassinated by one of his own police bodyguards. His six-year-old son, Simeon II (*q.v.*), succeeded Boris to the throne.

Borneo: *see* BRITISH EMPIRE; NETHERLANDS COLONIAL EMPIRE; NETHERLANDS INDIES.

Boston. Ninth largest city of the United States, with a population of 770,816 by the federal census of 1940, Boston is a seaport at the head of Massachusetts bay and is the capital of the state of Massachusetts. Area, 43.9 sq.mi., comprising most of Suffolk county. Mayor (Jan. 1, 1944): Maurice J. Tobin.

Twenty-two councilmen and three school committeemen were elected in 1943. State Attorney-general Robert T. Bushnell conducted a vigorous campaign against gambling. State and city officials took measures to prevent the recurrence of a few acts of anti-Semitic violence which received nation-wide publicity. The School committee appointed Francis J. Daly to head the Office of Juvenile Adjustment, created to combat juvenile delinquency. The governor of Massachusetts appointed Thomas F. Sullivan police commissioner to succeed Joseph F. Timility, whose term expired Nov. 1.

The city council approved the modernized building code enacted by the state legislature in 1939. The state appropriated $4,700,000 to build three 7,000- and one 5,000-ft. runways at the General Edward L. Logan airport in East Boston. School registration was 101,320. Many pupils left school to take jobs.

Easing of dim-out regulations restored a normal appearance to the city streets. The influx of army and navy personnel combined with the taking over of many buildings to create a severe shortage in housing and hotels.

The shipyards of Boston continued to produce war and merchant ships in increasing numbers. On Oct. 1, 1943, metropolitan Boston was declared a Group II (labour stringency) area by the War Manpower commission. A six weeks' fisherman's strike was still unsettled Jan. 1.

Indices for Jan.–Oct. 1943 (average 1925–1927=100) were as follows: Manufacturing employment 150.3, a gain of 6.3%; manufacturers' payrolls 270, a gain of 24.7%; department store sales 83.8, a gain of 6.6%. Jan.–Oct. 1943 bank clearings increased 10.8%; bank debits increased 15.8%; building permits decreased 39.8%; gross postal receipts increased 4.5%; Boston elevated passengers increased 20%.

The 1943 tax rate remained at $41.00 on an assessed valuation (real and personal) of $1,445,668,300, a decline of $20,470,100. The 1943 budget totalled $74,929,808, a decline of $4,500,100, including provision for the following: city departments $12,118,761, county departments $3,758,426, school department $16,145,717, debt service $10,684,080, state tax $3,325,050. The net debt on Dec. 31, 1942 was $133,945,434, a decline of $5,761,144, including a general debt of $60,047,547, temporary loans of $75,245,672 and a public services debt of $40,539,339. The estimated debt reduction in 1943 was $6,000,000. (S. J. McK.)

Bosworth, Hobart Van Zandt (1867–1943), U.S. motion picture actor, was born Aug. 11 in Marietta, O. In 1885 he played with a theatrical troupe in San Francisco, then joined the Augustin Daly stock company in New York. By the beginning of the 20th century, he had become widely known as a romantic actor and had been leading man to Minnie Maddern Fiske, Julia Marlowe and Henrietta Crosman. In 1909 he entered motion pictures and later headed the Bosworth company, which screened many of Jack London's stories. Bosworth himself was director and star in *The Sea Wolf*. In the early 1920s he was one of the best-known feature actors and stars. He died in Glendale, Calif., Dec. 30, 1943.

Botanical Gardens: *see* BOTANY

Botany. In *Pellia epiphylla* it had been assumed previously that the sperm swims by means of its two flagella from the antheridium to the archegonium. At the rate of swimming of the sperm, however, it would require, according to J. Walton (Univ. of Glasgow), several hours for the sperm to reach the archegonium. Walton found that the distance is traversed by the spermatocytes (each containing a single sperm) before the sperms are released. The spermatocytes are extruded by the antheridia into the water, rise to the surface, and are dispersed rapidly over the wet surface by surface tension forces. The sperm is not discharged from the spermatocyte until the archegonium is reached. The time required for the whole process is about 15 minutes.

A mutant obtained from *Neurospora* by X-radiation differed from the parent in having lost the capacity to form pyridoxin, and failed to maintain growth unless this substance was added to the culture medium. J. L. Stokes, J. W. Foster and C. R. Woodward, Jr. (Res. Lab. Merck and Co., Rahway, N.J.) demonstrated that this mutant could grow normally without the addition of pyridoxin provided that the pH of the medium was adjusted to the range from 6.0 to 7.3, and provided further that the nitrogen source in the medium was an ammonium compound, other forms of nitrogen being found to be ineffective.

By exposing germinating seed of *Crepis capillaris* and *Vicia faba* to X-rays, R. T. Brumfield (Harvard univ.) induced chromosome rearrangements in single cells in the young root tip. These chromosome characteristics, which served to identify such cells, *i.e.*, to "tag" them, were carried over into the cells resulting from the subsequent cell divisions, and permitted the author to determine what tissues were produced from these single cells. In this way evidence was obtained that the entire root develops from but a few cells, possibly as few as three, at the tip of the young root.

The effectiveness of X-rays in inducing chromosomal aberration was found by K. Sax (Harvard univ.) to be increased in tests with the microspores of *Tradescantia* by centrifuging the spores during the period of irradiation. The explanation given for this effect was that the stresses caused the broken ends of the chromosomes to separate and this favoured illegitimate unions between broken chromosomes.

Treatment by E. W. Newcomer (Univ. of North Carolina) of young cabbage plants with colchicine resulted in the production of an autotetraploid cabbage which differed from the parent type not only morphologically but also physiologically. The 4*n* cabbages were 25% to 50% higher than the diploids in reducing sugars, total sugars, acid-hydrolyzable substances, residual nitrogen (but not in soluble nitrogen) and vitamin C. The lower leaves of the tetraploid contained four times as much vitamin C as was found in the corresponding leaves of the diploid.

In at least nine genera of angiosperms, twin seedlings were found in which one of the pair had the normal diploid number of chromosomes, while the other had either the haploid, triploid, or tetraploid number. D. C. Cooper (Univ. of Wisconsin) found haploid-diploid twins in about 1% of the ovules of seven species of lilies. The haploid member of the twins was found to have been derived from the division of a synergid. Also, in a cross of *Nicotiana glutinosa* × *N. tabacum*, a haploid twin was found to have developed from a synergid. The role of synergids in the production of haploid plants is emphasized by these results.

In more than 50% of about 900 isolates of imperfect fungi, involving 3 orders, 29 genera and 35 species, it was found that the mycelium was composed of two culturally distinct types, one producing conidia in abundance, but with scant mycelium (designated as C), and the other producing an abundant mycelium but few conidia (designated as M). In subsequent work, H. H. Hansen and W. C. Snyder (Univ. of California), working with *Fusarium*, found that the M type was produced *de novo* from pure cultures of the C type, but the reverse change of M to C was not obtained. By means of crosses with *Hypomyces solani* f. *cucurbitae*, it was shown that M and C behave as allelomorphs, and further that M could function only as a male.

C. H. Meredith (Glenleigh Lab., Highgate, Jamaica, B.W.I.) found that a species of *Actinomyces* produced a substance that would dissolve the mycelium of *Fusarium oxysporum cubense*. The substance diffused through agar.

According to experiments by P. R. Burkholder (Yale univ.) extraordinarily large amounts of riboflavin (vitamin B_2) are formed by the yeast *Candida guilliermondia*. Most of the riboflavin accumulates in the medium.

H. L. Pearse (West. Prov. Fruit Research Inst., Stellenbosch, South Africa) grew grape vines (*Vitis vinifera*) in sand cultures maintained at various levels of nutritive capacity and found that better rooting of cuttings was obtained with cuttings taken from plants grown under semi-starvation conditions (with respect to both mineral and nitrogen components) than from plants grown under conditions of adequate or excessive nutrition. Furthermore, such cuttings responded more readily to treatment with the root-inducing chemical, indolebutyric acid.

By heating tryptophane, either in water or in solutions of NaOH (0.25 N to 0.00025 N), S. A. Gordon and S. G. Wildman (Univ. of Michigan) obtained a product which induced curvatures of the coleoptile of *Avena* in the manner of the natural auxins from plant tissue.

Crosses of certain soft red winter wheat varieties (*Triticum vulgare*) with Marquillo spring wheat in experiments by R. M. Caldwell and L. E. Compton (Purdue Univ. and U.S. Dept. of Agric.) resulted in the production of F_1 seedlings which uniformly developed normally until reaching the two-leaf stage, then all such plants died. The lethality was shown to be controlled by a pair of dominant complementary genes.

When W. S. Hale, S. Schwimmer, and E. G. Bayfield (U.S. Dept. of Agric. and Kansas Agr. Exp. Sta.) added ethylene to the storage space containing freshly-harvested high-moisture wheat seeds at the rate of one part of ethylene to 10,000 parts of air, they found that such treated wheat did not heat as rapidly or as much, furnished a better grade of grain, showed a higher percentage of germination, and gave a better baking performance than untreated wheat stored under identical conditions but without the addition of ethylene. (*See* also HORTICULTURE.)

(F. E. DE.)

RARE PLANTS botany, were discovered in the bomb craters and ruins of London in 1943. Here a botanist is examining a new flower which sprang up in a crater enriched with the nitrate of a bomb. No conclusive proof of the origin of these plants was advanced

Botanical Gardens.—Dr. E. D. Merrill of Harvard Botanical collections and Arnold arboretum finished a manual on *Emergency Food Plants and Poisonous Plants of the Islands of the Pacific* for use of U.S. forces in the Pacific area; a book of 150 pages, 113 illustrations, and a first printing of 125,000 copies. Under Dr. Merrill's direction a study was being made of the Harvard collection of plants from New Guinea and Solomon Islands. A plant survey of the Alcan highway was being made to furnish certain specific information needed by the engineers and military people for an interpretation of their aerial survey of the route. Dr. Merrill's group found a means of prolonging the life of cut branches used in camouflage. A number of members of the New York Botanical garden staff were being used as experts by the government and industrial organizations in the war effort.

The staff of the Brooklyn Botanic garden did much to aid the victory garden program in greater New York and neighbouring regions. Montreal Botanical garden extended its garden on medicinal plants, including not only those in medicinal use but many that were grown for medicine in Europe before the discovery of America, and certain plants used by the American Indian. This garden also directed 10,000 victory gardens in Montreal. Holden arboretum at Cleveland, O., devoted 100 ac. of its area to growing of garden and farm plants. University of Washington arboretum grew more than 100,000 units of a wide variety of deciduous species of plants for use as camouflage.

University of Wisconsin arboretum and Wild Life refuge increased the planting of wildflowers on the Wildflower trail, planted 5,000 Tamaracks, initiated an extensive study of songbird nesting, started a survey of the parasitic fungi of the arboretum area, continued a study of effects of crowding on mixed fish populations in ponds, and began a study of life histories of native minnows to develop methods of artificial propagation. Morton arboretum continued its educational classes, and is writing a fern key. Cornell University arboretum added 400 ac. to its holdings to make possible an anticipated postwar expansion. Missouri Botanical garden issued the first two numbers of "Flora of Panama," a project under way for many years. They also acquired an additional tract of land of 160 ac., the last bit of virgin forest in the vicinity of St. Louis. Boyce Thompson Southwestern arboretum worked with commercial groups to develop the culture of jojoba nuts and the propagation and culture of cork oak. Jojoba nuts contain a wax that promised to substitute for the expensive carnauba wax. This wax could also be transformed into a rubber. (*See* also HORTICULTURE.) (W. C.)

Bougainville: *see* SOLOMON ISLANDS.

Boutens, Peter Cornelis (1870–1943), Netherlands poet, was born Feb. 20 in Middelburg on the island of Walcheren, the Netherlands. He studied classical literature at Utrecht university and took his doctorate at that school in 1899. He was professor of classical languages at Noorthey institute in Voorschoten and later moved to The Hague, where he turned to writing. He translated into Dutch the works of the ancient Greek writers. Boutens' most famous work was *Beatrys* (1908), a mediaeval legend told in verse. His works were translated into English by Sir Herbert Grierson of Edinburgh university. The poet died at his home in The Hague, March 14.

Bowles, Chester (1901–), U.S. advertising executive and government official, was born in Springfield, Mass., Aug. 5. A graduate of Yale, 1924, he became an advertising copywriter and together with William Benton formed the advertising firm of Benton and Bowles, July 1929. Mr. Bowles was made chairman of the board of that company in 1936. In Jan. 1942, he took a leave of absence to work on a dollar-a-year job in Connecticut, later becoming OPA administrator for the state. On July 15, Prentiss M. Brown, then OPA national director, named Bowles as general manager of his agency. The latter, given full authority by Brown, reorganized the agency; simplified price and rationing regulations and encouraged establishment of advisory committees to deal with complaints of business and industry. As a result, congressional and press criticism of OPA methods subsided somewhat. On Oct. 25, 1943, Bowles succeeded Brown who had resigned four days earlier, as OPA administrator. While Bowles was reluctant to impose harsh measures, he nevertheless served notice on assuming his new post that he intended to hold cost-of-living prices to the levels of Sept. 1942. He stated bluntly that OPA would not be a doormat for "scheming" minority groups and warned against inflation.

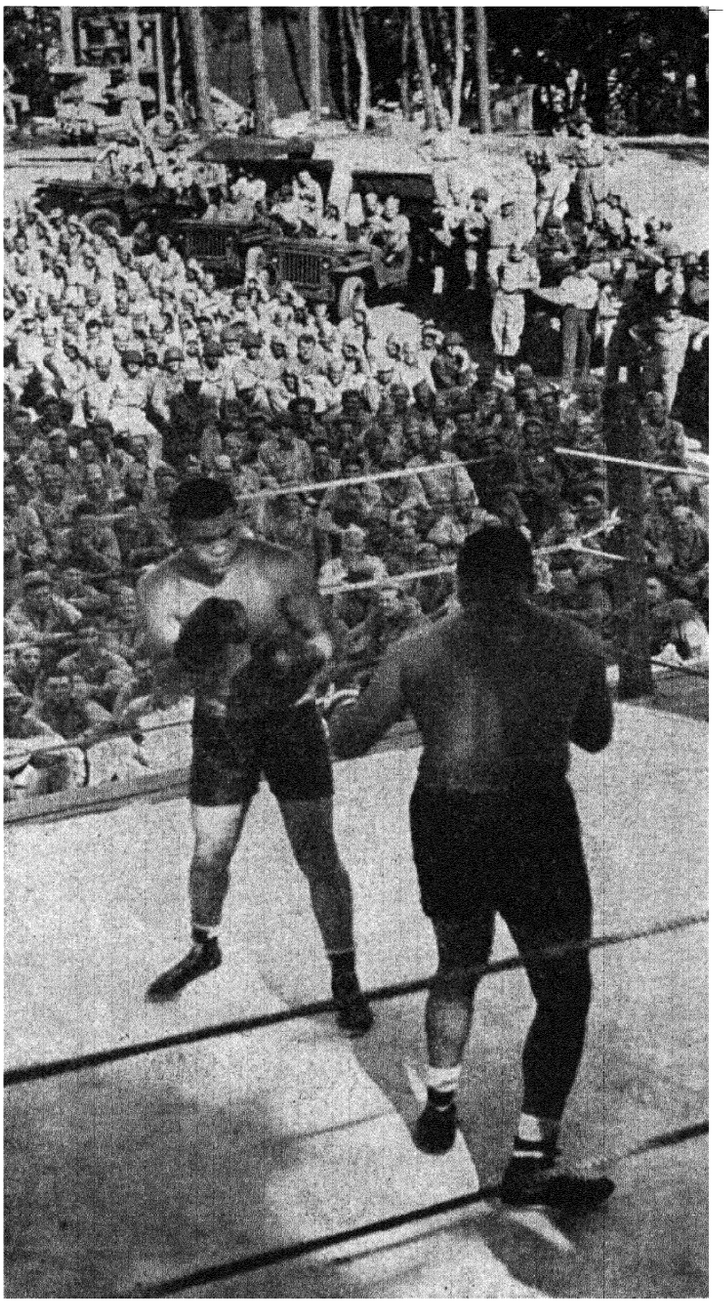
Bowling. With bowling's two major championships—the American Bowling congress and Women's International Bowling congress—cancelled at the request of the Office of Defense Transportation, the pin-toppling interest of 1943 centred on the National Individual Match Game championship at Chicago. Ned Day of West Allis, Wis., after being voted "Bowler of the Year" by the Bowling Writers' association, went on to win the match game title with a 64-game average of better than 208 per game. Day outmatched a strong field which included: Paul Krumske of Chicago, second with 289.15 points to

Day's winning 315.21; Rudy Pugel of Milwaukee, third with 294.14; Buddy Bomar of Chicago, fourth with 294.30, and John Crimmins of Detroit, fifth with 294.11. Connie Schwoegler of Madison, Wis., the defending champion, finished ninth.

Deprived of its big classic during 1943, the A.B.C. continued to give recognition to its outstanding participants with a compilation of the year's outstanding scorers. Louis Foxie of Paterson, N.J., rolled the year's individual high of 824, which enabled his team to count a high 3,547 for team total and 1,286 for high team game.

In spite of the war hardships and a shortage of pin boys, bowling enjoyed one of its best years in 1943. An estimated 12,000,000 bowlers took part in the recreational phase of the game. Telegraphic bowling, a method by which scores sent by telegraph were compared and matches decided, became popular in view of limited transportation. High school bowling especially took to telegraphic play.

Although not made in regular A.B.C. competition, two team titles were claimed during 1943. The Detroit Strohs staked claim to the national team title, while Frank Mataya and Nelson Burton of St. Louis were regarded as the national doubles titlists. (M. P. W.)



Boxing. Most of the ring champions were in the armed forces. Joe Louis, sergeant in the U.S. army, occupied himself exclusively with boxing exhibitions for the men in service. Billy Conn, outstanding challenger for the world heavyweight title, was a corporal in the army, stationed most of the year at Jefferson Barracks, Mo.

Championships in four divisions where possession was undisputed were frozen. In addition to Louis' heavyweight crown, they were the light-heavyweight, middleweight and welterweight championships. Gus Lesnevich, leader of the light-heavyweight, or 175-lb. class, was in the coast guard. Tony Zale, holder of the middleweight, or 160-lb. title, was in the navy. Freddie Cochrane, champion of the welterweight, or 147-lb. class, was in the navy.

Willie Pep, who shared the possession of the world featherweight title, made one defense of his crown, held the title, saw his remarkable streak of victories shattered after 62, and enlisted in the navy. This left only the lightweight and bantamweight classes untouched by the war. The flyweight class was dormant, as it has been for years. Little was heard of its world ruler, Jackie Patterson of Scotland.

Manuel Ortiz, Mexican resident of El Centro, Calif., ruler of the featherweight division, successfully defended his title no less than eight times, a record for championship defense in modern ring history. Starting on Jan. 2, he won a decision over Kenny Lindsay at Portland, Ore. On March 10, Ortiz knocked out Lou Salica in 11 rounds at Oakland, Calif. April 28 saw Ortiz knocking out Lupe Cordoza in six rounds at Fort Worth, Tex. On May 27, Ortiz won a decision over Joe Roberts at Long Beach, Calif. He followed this by knocking out Roberts in seven rounds at Seattle, Wash., July 13. In his sixth defense of the 126-lb. title Ortiz, on Sept. 5, knocked out Fileo Gonzalez in five rounds at Mexico City. On Oct. 2 he knocked out Leonardo Lopez in four rounds at Hollywood, Calif., and his amazing year concluded on Nov. 23 when he won a 15-round decision over the hitherto unbeaten Benny Goldberg of Detroit, at Los Angeles. Not even Joe Louis, most active of all the ring champions in modern history, could match this record of title defense.

Outstanding among the box-office attractions, however, was Beau Jack, who, under his real name, Sidney Walker, was originally a caddy and shoe-shine boy in his native Augusta, Ga. He not only contrived to lose and regain his world lightweight title

JOE LOUIS began a 14-week exhibition tour of U.S. army camps Aug. 30, 1943, with Sgt. George Nicholson, his old-time sparring partner. Here he is shown at Camp Edwards on the second day of the tour

in the states of New York, New Jersey and Pennsylvania, but he shared distinction for the year's largest gate receipts and established himself as the greatest box-office attraction active in the ring.

In six bouts Beau Jack drew a total of $481,415 to Madison Square Garden, where all his boxing was conducted, under the auspices of the Twentieth Century S.C., Mike Jacobs, promoter. His record gate for the year, which was also a new high for Beau Jack, was $104,976, for the bout in which he defeated Henry Armstrong, former triple champion of the ring, on the latter's return to action. It was held April 2, 1943, and attracted 19,986 persons.

Beau Jack drew $70,291 in a bout with Fritzie Zivic, former welterweight champion, Feb. 5. In a return bout against Zivic he drew $71,346, March 5. The Armstrong bout followed, and on March 21, Beau Jack drew $94,500 on a paid attendance of 18,343 persons, in a 15-round bout against Bob Montgomery, Philadelphia, in which Beau Jack lost his world lightweight title. Beau Jack lost a 10-round decision to Bobby Ruffin, Long Island City, on Oct. 4, in a bout that attracted receipts of $43,429. On

Nov. 19, he regained his lightweight honours in a title bout against Montgomery, winning a decision in 15 rounds before 17,866 persons who paid receipts of $96,873.

Sammy Angott, Washington, Pa., who voluntarily surrendered the world lightweight title late in 1942 to enter war work, returned to the ring early in 1943 and was indirectly responsible for the confusion surrounding the title as the year ended. The National Boxing association declined to recognize the tournament sanctioned by the New York State Athletic commission from which Beau Jack emerged the winner and champion. Instead, after Angott snapped Willie Pep's 62-straight winning streak, the N.B.A. sanctioned a bout between Slugger White, Baltimore, and Angott as for the title. Angott won the bout and gained recognition as champion in every boxing centre except New York, New Jersey and Pennsylvania.

Similar confusion surrounded the world featherweight title, a hold-over condition from 1942. Willie Pep, New York State Athletic commission champion, defended his title against Sal Bartolo in Boston, June 8, and joined the navy. Phil Terranova, Bronx, N.Y., conquered Jackie Callura, Hamilton, Ont., Aug. 16, and gained recognition as N.B.A. featherweight champion. Terranova knocked out Jackie Callura, in six rounds at New Orleans, Dec. 27.

Service boxers were conspicuous in the annual championships of the Amateur Athletic union, decided among an entry list of 89 boxers representing 16 district associations on April 12 and 13 in Boston. Though among the best tournaments on record in competition, the affair was a disappointment in receipts. Three army boxers gained the finals, but only one, Earl O'Neill, 118-lb. boxer from Fort Sill, Okla., won a title. Syracuse university won the Eastern Intercollegiate A.A. boxing championships held at Syracuse, March 6, with a record total of 30 points. Another record was supplied when Syracuse won six of the eight titles. A distinctive feature was the victory of Salvatore (Toots) Mirabito in the heavyweight division. He closed an outstanding college boxing career with his third such victory, as he registered his 30th straight college contest. He entered the army shortly afterward leaving behind a winning streak of 80 bouts in high school, prep and college competition. Boxers of the University of Wisconsin dominated the National Collegiate A.A. championships held at Madison, Wis., March 26. They clinched team honours, winning five individual titles. Michigan State's boxers won two and the other championship went to Washington State.

Boxing receipts at Madison Square Garden under direction of Promoter Mike Jacobs, reached an aggregate of $1,136,228 for 22 shows. The paid attendance was 322,512. The largest "gate" of the year was drawn by Beau Jack and Henry Armstrong on April 2 as stated above, and the largest crowd of the year was 21,240 attracted to the ten-round bout between Beau Jack and Fritzie Zivic, Feb. 5. (J. P. D.)

Boy Scouts. From the beginning of the war until the end of 1943, 47 different projects had been undertaken by scouts at the request of government agencies. They had collected scrap rubber, metal, tin cans, grease, books, musical instruments and nearly 500,000,000 lb. of waste paper. They had produced model planes and ships, served as civilian defense messengers, aeroplane spotters, fire watchers, assisted in making surveys for war housing agencies, in aiding rationing boards, selective service boards, community chests, war chests, foreign relief and in countless other ways helped in the war effort.

During 1943, especially, waste paper and scrap metal collections were carried on throughout the U.S. by scouts. Scouts also served as government dispatch bearers in the distribution of posters twice each month and the distribution of other government informational material throughout the nation. They assisted the Red Cross in the promotion of blood banks and aided the war housing program in 210 communities. The Food for Freedom program of the Boy Scouts of America was outstanding in the service projects.

A new pre-Ranger type of training was developed, designed to teach older boys skills which they might need if they entered the armed forces, to give them a variety of training, self-reliance and personal discipline and thus equip them for service if they should be called upon for military service.

In Feb. 1943, Dr. James E. West, who from the beginning of the organization had been chief scout executive, was promoted to the office of chief scout and Dr. Elbert K. Fretwell, former Professor of Education at Teachers' college, Columbia university, succeeded him as chief scout executive.

The new Aviation Merit badge pamphlets and the *Air Scout Manual* were issued and the air scout program attracted many boys. There was also a big increase in cubs, the program for younger boys. In spite of demands made by the various work projects, more scouts camped in their own troops in 1943 than in any previous year in scouting. The grand total membership of the Boy Scouts of America as of Dec. 31, 1943, was 1,613,783. Total troops and packs numbered 51,953.

Great Britain.—During 1943 British scouts carried on, as they had since the beginning of the war, by giving every possible assistance to the war effort. Scouts in England performed numerous war service jobs.

An example of the type of service scouts performed in 1943 was the account received of an entire Rover scout crew manning one of the leading ships of a British mine-sweeping flotilla in home waters. In the early days of the war, while still in their home town, this crew had sighted a U-boat and was able to direct destroyers to the spot to attack. They shared the record for their base of mines swept and carried out a number of special operations.

During 1943 a special war emergency section of the movement

U.S. BOY SCOUT learning to identify German planes from models

was introduced into British scouting under the name "War Service Patrols." On passing certain public service tests boys of 15 and over could be drafted into these special patrols and received advanced training in campaigning, health and endurance training, exploring, observation and other subjects of this kind.

(L. W. BA.)

Bracco, Roberto (1861–1943), Italian dramatist, was born Nov. 10 in Naples. A protege of a Naples newspaper editor, Bracco at the age of 17 became a reporter. He worked on several newspapers and sometime later found his stride as dramatist and novelist. He became one of Italy's noted playwrights in the pre-fascist days, and aroused much interest in his psychological dramas. One of his plays, *Countess Coquette*, a Nazimova vehicle in 1907, established his reputation in the United States and was also received successfully in Paris. *The Little Saint* was produced in New York city in 1931. He wrote about 40 plays, including *The Right to Live, Phantasms, Madame President, One of the Honest Ones* and *Masks*, and about six volumes of stories. He fell into disrepute with the fascists in 1926 because of his Liberal views; his home was wrecked by a band of terrorists, and the remainder of his life was spent in obscurity. He died in Naples, April 21, according to a Swiss report.

Bracken, John (1883–), Canadian political leader, was born at Ellisville, Ont., on June 22, and graduated from the Ontario Agricultural college, and the University of Illinois. After graduation Bracken went into the prairie provinces as a seed inspector for the Canadian government. He became professor of field husbandry at the University of Saskatchewan, and later president of the Agricultural college of Manitoba. It was while holding this post that in 1922 he was offered, and accepted, the leadership of the newly formed Agrarian or Progressive party in the province of Manitoba. He was returned to the legislature in a by-election held in Le Pas. In 1932 he headed a coalition government of Progressives and Liberals, and later the coalition principle was extended to include Conservatives, Co-operative Commonwealth Federationists, and Social Credit members. In Dec. 1942, he emerged as a national figure, when he was chosen national leader of the Conservative party by a nominating convention meeting at Winnipeg. In deference to his views, the name of the party was altered to Progressive Conservative.

During 1943, Bracken made an extensive tour of Canada, speaking in such centres as Quebec, Hamilton and Toronto. As Bracken did not attempt election to the house of commons, Gordon Graydon acted as Opposition leader. (J. I. C.)

Bradley, Omar Nelson (1893–), U.S. army officer, was born in Clark, Mo., on Feb. 12. He was graduated from the U.S. Military academy in 1915 and later from the Infantry school, the Command and General Staff school and the Army War college. Between 1929 and 1941 he served as chief of the weapons section at the Infantry school, commandant at West Point, and secretary of the general staff in Washington. Early in 1941 he was appointed commandant of the Infantry school. Two months after the U.S. entered World War II, Gen. Bradley was appointed to command the 82nd division, and in Feb. 1943, he was sent to North Africa. Near the end of the campaign there he was assigned to command the 2nd corps, which he led to victory at Bizerte and Tunis. Two days later the nazi commander surrendered 25,000 men to him. For this achievement he was made a lieutenant general and awarded the distinguished service medal. In Jan. 1944, it was announced that Gen. Bradley would command the ground forces being massed in Britain for the invasion of Europe.

Brazil. A republic in eastern and central South America and the largest independent country in the western hemisphere; language: Portuguese; capital: Rio de Janeiro (pop. 1940: 1,781,567); president in 1943 (since 1931): Dr. Getúlio Vargas.

Brazil is divided into 21 states and six territories. Five of these territories were created by presidential decree of Sept. 13, 1943 (effective Oct. 1). All frontier areas, they were separated, respectively, from Pará, Amazonas, Mato Grosso, Paraná and Santa Catarina states. They are: Amapá, adjoining Surinam and French Guiana; Rio Branco, adjoining British Guiana and Venezuela; Guaporé, on the Bolivian border; Ponta Pôrá, north of Paraguay and east of the Paraguay river; Iguassú, between the Uruguay and Paraná rivers and north of the Argentine territory of Misiones.

The country has an area of 3,291,416 sq.mi. The population, according to the 1940 census (revised), was 41,565,083, an increase of 10,929,478 since 1930. In 1943 official sources estimated it at 43,500,000 as of the end of 1942.

The main concentrations of population are in the south and the east.[1] Four southern states, with less than 10% of the area, have 31.33% of the population (São Paulo 7,239,711; Rio Grande do Sul 3,350,120; Paraná 1,248,536; Santa Catarina 1,184,838). The five eastern states of Rio de Janeiro (1,862,900), Sergipe (545,962), Baía (3,938,909), Minas Gerais (6,798,647) and Espírito Santo (758,535), along with the Federal District (*i.e.*, Rio de Janeiro city, 1,781,567) occupy a seventh of the area and have 37.9% of the population. Another seventh of the area, the northeastern states of Maranhão (1,242,721), Piauí (826,320), Ceará (2,101,325), Rio Grande do Norte (774,464), Paraíba (1,432,618), Pernambuco (2,694,616) and Alagoas (957,628) has 24.13%. The Amazon valley states of Amazonas (453,233) and Pará (956,870) and Acre territory (81,326), with over three-eighths of the area have only 3.59% of the population. Interior Goiaz (661,140) and Mato Grosso (1,477,041) occupy a full quarter of the area but have only 3.05% of the population.

The capital and São Paulo city (pop. 1,318,000) between them have 7.4% of the population.

History.—World War II and its effects continued to dominate Brazil's history and development throughout 1943, its first full year as a belligerent. Her unstinted co-operation, coupled with the natural advantages of her strategic position, was of vital importance in expediting transport and communication between the North American arsenal of democracy and the Mediterranean war zone, while her economic contributions were of increasing consequence.

The axis submarine campaign in South Atlantic waters was only less intense than during 1942, and was at times far more active than in the North Atlantic. Between Brazil's entry into the war (Aug. 1942) and the close of 1943, 27 Brazilian merchant ships were lost. Against this, Brazilian forces alone had, by Aug. 31, chalked up a score of nine "sure" sinkings of axis submarines, as well as a number of probables.

In combatting subversive activities of enemy agents within the county, Brazil took vigorous steps to repress them. In July a presidential decree directed the liquidation of two of the largest and oldest German commercial firms in Brazil, with assets estimated at $6,000,000.

The war gave a tremendous stimulus to production and trade. Unemployment was at an all-time low, and the year's favourable

[1]Populations given for individual states include the territories segregated in 1943; see above.

trade balance was estimated to be in excess of $100,000,000. Foreign trade itself was marked by an increasing diversification of exports and featured by a sharp rise in export of manufactures. Continued prosperity and high export totals were assured by agreements with the United States for strategic materials and with Great Britain for purchase of all Brazilian meat exports for United Nations war needs. On Dec. 21 a further agreement was made with Great Britain and the United States under whose terms those two countries undertook to purchase the entire exportable excess of Brazil's 1943, 1944 and 1945 rice crops over and beyond 10,000 tons a year reserved for normal export demands.

Economic shortages and oversupplies arising from war conditions were in some instances acute. Industrial production as a substitute for importation of manufactured goods was stimulated. So, too, was the output of some critical and strategic war materials, although many of these were as yet only barely coming into production.

Continued acute gasoline shortage served to encourage the use of *gasogenios* (charcoal-burning equipment), and by the end of 1943 it was estimated that over 28,000 automobiles (11½% of Brazil's total) were thus equipped. Eight distilleries for fuel alcohol from mandioca were under construction. These, scheduled for completion in early 1944, would have a capacity of 4,500,000 gal., and an additional 12 distilleries were expected eventually to raise the capacity to 10,500,000 gal.

The war burden on the national transport system caused local shortages in some food commodities. At times meat and sugar were rationed in Rio de Janeiro and other large cities. To spread the wheat supply, it was required that 85% instead of 75% of the grain be used in the flour, thus conserving 100,000 tons of wheat. Sharp restrictions were put on the export of rice, which was limited to half the production in Rio Grande do Sul and a third in other states until the new crop came in.

The general prosperity, coupled with shortages in goods, brought a gradual rise in prices. Rents were frozen. Early policy was to avoid general price control. On Nov. 10, a country-wide raise in wages was imposed by government decree. As this in its turn threatened to precipitate price advances, a decree of Nov. 26 fixed ceiling prices as of Nov. 10 for all merchandise, wholesale and retail, and transportation rates.

Education.—At the end of 1941 Brazil had 47,601 schools of all types (59% more than in 1932); of these, 42,794 were primary. School enrolment totalled 3,791,500 (a 67% increase in nine years), including 3,350,737 in primary schools. As of Sept. 1942, there were 739 secondary schools. Over half of these were in two states and the Federal District. In addition there were a number of vocational and other specialized institutions.

Finance.—The monetary unit is the cruzeiro (value: approx. 5 cents U.S.), divided into 100 centavos. This supplanted the former unit, the milreis, in Nov. 1942.

The 1943 budget anticipated revenues of 4,777,700,000 cruzeiros and expenditures of 5,270,200,000 cruzeiros, aside from a balanced extraordinary budget of 600,000,000 cruzeiros for a public works program. The deficit in 1942 aggregated 1,166,200,000 cruzeiros against an anticipated 637,400,000, the excess being due primarily to war expenditures of 517,300,000 cruzeiros.

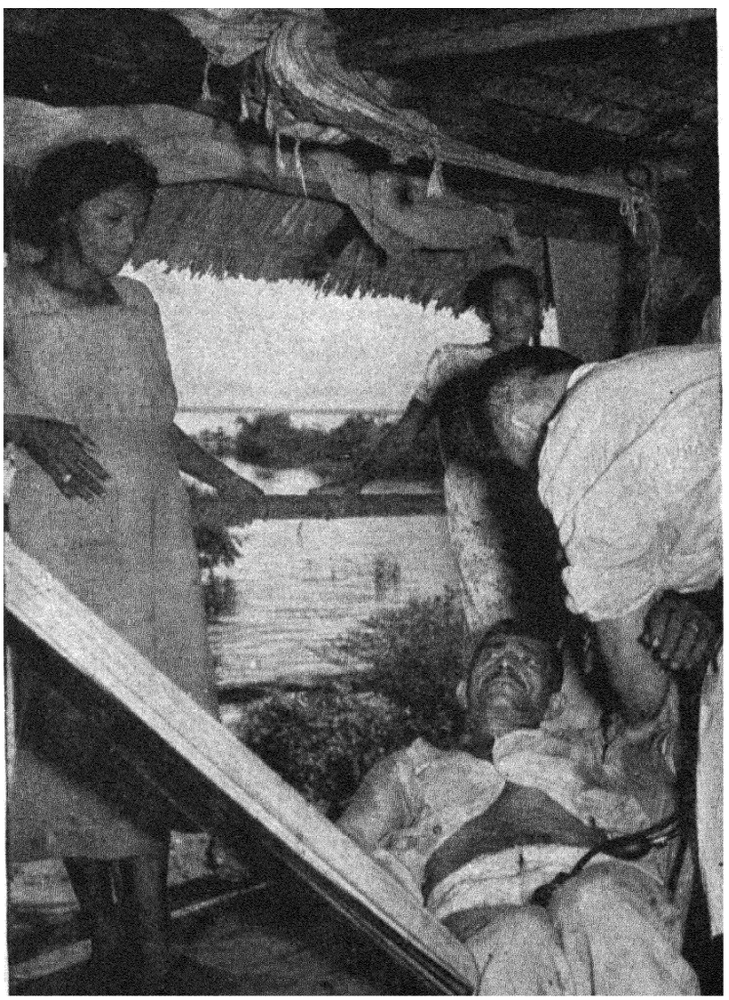
War costs are covered from taxes and by compulsory loans equal to the year's income tax payments (first half of 1943: approximately 323,369,129 cruzeiros).

On Dec. 31, 1942, the national debt aggregated 1,370,800,000 cruzeiros external and 8,895,900,000 internal. On Nov. 25, 1943, a readjustment of the external debt, which had been in default, was announced, under which service would be resumed with some adjustment of interest.

LOADING WILD BRAZILIAN RUBBER into a Pan American clipper at Manaus, far up the Amazon, for shipment to the United States in 1943

Trade and Communication.—War conditions precluded publication of detailed data on foreign trade for 1942 and 1943. Those years, however, were marked by abnormal trends whose continuance is in many instances questionable and by wide fluctuations in monthly totals for individual commodities. These reflected war dislocations of trade, such as arbitrary routing of shipping for war purposes and temporary embargoes, or at least sharp restrictions, on export of commodities (as coffee), coupled with priorities for essential items.

In 1941, the last year for which complete totals were available, export aggregated 6,729,401,000 cruzeiros against 4,964,149,000 in 1940. The United States was overwhelmingly the greatest single purchaser of Brazilian goods in 1941, taking 56.9% (1940: 42.3%). Great Britain, 12.2% (1940: 17.3%), Argentina, 9.2% (7.2%), Japan, 4.0% (5.8%), Canada, 3.4% (2.1%), China 1.8% (3.1%) and Uruguay, 1.6% (1.5%) followed. Imports were supplied chiefly by the United States, 60.4% (1940: 51.9%), Argentina, 11.2% (10.8%), Great Britain, 5.7% (9.4%) and Curaçao, 4.4% (4.7%).



Raw materials made up 48.3% of 1941 exports, foodstuffs 46.2%, manufactures 5.5%. Imports comprised: manufactures

(52.3%), raw materials (33.3%), foodstuffs (13.6%), live animals (0.9%). The leading separate commodities were coffee (29.9%), raw cotton (15%), preserved and refrigerated meats (6.7%), cacao 4.7%, followed by hides and skins, carnauba wax, cotton cloth, vegetable oils (including cottonseed, oiticica, castor, copaiba, coconut, and babassu), castor oil seed, lumber, diamonds and quartz. Leading separate import commodity groups were machinery and apparatus, wheat, automobiles and accessories, iron and steel goods, coal, coke, etc., chemicals, gasoline, unrefined iron and steel, lubricating oils. During 1942 and 1943 sharp increases were registered in vegetable oil, rubber, minerals and other war commodities.

The outstanding feature of 1942 trade was the tremendous increase in value of exports and the decline of imports. Thus, export values reached 7,495,000,000 cruzeiros, an all-time high, eclipsing the previous 1941 record total by 11.4%, while imports declined 15.7% to 4,644,000,000 cruzeiros value. Approximately 70% of the 1942 exports went to other American countries (1941: 75.4%; 1940: 54.9%), who in turn supplied 84% of import values (1941: 83.4%; 1940: 74.3%). The increased exportation was the result of sharp increases in volume and value of vegetable oil, rubber, minerals and other war shipments, which continued through 1943.

In the first half of 1943 the "favourable trade balance" declined to a net of 631,277,000 cruzeiros, but rose later in the year so that unofficial sources estimated a total in excess of $100,000,000 (2,000,000,000 cruzeiros) for the full year. A feature of the first six months was the jump in exports to African countries (principally the Union of South Africa), which took 12% of all exports, against 1.8% in the first half of 1942 and a negligible quantity in 1941. In Nov. 1943 the total exportation during Brazil's first full year of war (Sept. 1942–Aug. 1943 inclusive) was officially reported as 7,943,918,000 cruzeiros, with the leading purchasers the United States, Great Britain, Argentina and South Africa. Of more lasting significance was the spectacular increase in the proportion of manufactured goods. United States purchases for 1943 were unofficially estimated to have increased some 35% over 1942 and sales even more.

THE HEALTH of Brazilian rubber workers was carefully watched by health officers to prevent the spread of tropical disease as the vast wild rubber lands of the interior were opened up in 1943. Here a doctor is taking the blood pressure of a worker

External communications by air and by sea are normally good; during 1943, however, both were heavily taxed by war transport demands and subjected to the restrictions of war priorities. Too, shipping was harassed by the axis submarine campaign, although to a less degree than during 1942. Pan American Airways provides air transport north and south, with a transatlantic link from Natal to Africa and other parts of the eastern hemisphere, and a connection through Corumbá to the west coast of South America. In Dec. 1943 service on this last was increased from two to three flights weekly. In August, formal application was made in the United States by Eastern Air Lines for permission to inaugurate a service from that country due south by Venezuela through Manaus and Corumbá, thence by way of Asunción (Paraguay) to Buenos Aires.

Land communication with neighbouring countries is practically nonexistent except for rail connections with Uruguay and highway with Uruguay and Argentina.

Within Brazil, aviation is under control of the ministry of aviation. There is service to all parts of the country by Panair do Brasil (a Pan American Airways affiliate) and by Brazilian military planes. During 1943 the former began experimental night flights between Fortaleza and Natal. The Brazilian military planes maintain regular mail service over numerous economically unprofitable domestic routes and to Asunción, Paraguay. Air routes within the country total somewhat in excess of 125,000 mi. in length.

Rail and highway communications are generally inadequate. A national highway program was being formulated under a decree-law of July 1943. There are some 160,000 mi. of highway of all types. In 1941 the country had 242,995 motor vehicles, over half of them registered in São Paulo state and the Federal District. The rail system (20,906 mi.) is being extended.

Water routes play an important role in domestic communication, providing practically the only surface transportation in the Amazon basin and the major heavy freight link between northern and southern points. Under war conditions the needs of coastwise traffic, formerly met in considerable degree by foreign shipping, compelled the concentration of the Brazilian merchant marine in coast traffic. In 1942 this coastal trade carried 52% of the country's entire wartime shipping.

Agriculture.—Brazil is primarily an agricultural country. Coffee and cotton are the principal money crops, despite recent declines in their relative importance, but the country produces a wide variety of agricultural commodities.

Coffee is produced in 15 states, with an estimated 8,625,240 ac. devoted to its cultivation. São Paulo state accounts for 60% of production, Minas Gerais 20%, Espírito Santo and Paraná between them another 10%. Brazil is normally the world's third heaviest per capita consumer with 6.478 kgs. annually (Denmark 9.124 kgs.; United States 7.493 kgs.). Domestic consumption, however, accounts for but 4,500,000 to 5,000,000 bags. Export averaged 14,695,675 bags (of 132 lb. each) in the period 1925–39, but fell to 12,045,715 bags in 1940 and 11,052,484 in 1941. A large annual surplus necessitated systematic destruction. In 1943 some 2,300,000 bags were destroyed, bringing the total since 1931 to over 77,000,000. The Inter American Coffee Quota

agreement of 1941, which allotted 9,300,000 bags (subsequently expanded) to Brazil as its quota for export to the United States, stabilized the coffee market; but unsatisfactory shipping conditions in 1942 so interfered with export that the total to all countries was only 7,259,658 bags. The United States, however, agreed to purchase for cash a minimum of 9,300,000 bags, regardless of shipping facilities, storing the excess. Although shipping conditions were materially improved, this system was continued through 1943. Actual export of coffee in the first eight months of 1943 totalled 6,863,282 bags, of which 85% went to the United States. During 1943 the Brazilian government made a gift of 400,000 bags to United Nations forces serving in combat areas.

Cotton is produced in a majority of the states, with São Paulo state accounting for nearly 70% of the total. Formerly over 50% of the cotton crop was exported; although export of raw cotton sharply declined because of war conditions and of increasing industrialization in Brazil, Brazilian cotton textiles were being increasingly exported.

Cacao is produced on a considerable scale in the tropical areas, but suffered heavily from world overproduction and from war conditions. Corn, rice, sugar, oranges, beans and mandioca are produced in important quantities for domestic consumption.

Rubber, indigenous to Brazil, grows wild in the Amazon valley. From early 1942 on, strenuous efforts were made to facilitate its gathering. The United States provided technical assistance and undertook to aid transportation and sanitation projects. The Brazilian government on its part furthered the migration of an estimated 80,000 labourers from other parts of the country to the rubber districts. Balata, close kin to rubber, used especially for machine belting and comparable purposes, is likewise found in quantity.

In 1939 Brazil had 40,564,839 head of cattle, 21,776,770 swine, 10,713,008 sheep, 6,579,536 horses, 6,037,202 goats, and 3,944,998 mules and asses. The cattle and swine industries are especially important in Minas Gerais and the southern states, sheep in Rio Grande do Sul. Approximately 4,500,000 cattle are slaughtered annually in the stockyards.

Meat products were exported in 1941 to the value of 523,718,000 cruzeiros.

Manufacturing.—Manufacturing is primarily for domestic consumption. Exportation was greatly accelerated after 1939, so that in the first six months of 1943, manufactured goods represented 22.6% of all export values, against 11.9% in 1942, the previous high and 5½% in 1941. Exported manufactures are chiefly cotton textiles, chemical and pharmaceutical products and meat products.

During 1943 the huge steel plant at Volta Redonda (started in 1940 with United States financial aid) began partial production.

Mineral Production.—The great bulk of Brazilian mineral wealth lies in the eastern and southern portions and is only slightly exploited. Minas Gerais is the greatest centre of mineral resources. Coal, chrome and iron are in considerable quantity. Bauxite deposits are exploited in Minas Gerais; manganese is of growing importance. Some petroleum deposits in Baía state are being exploited. Production, however, is estimated at but 220 bbl. daily. (*See* also ARGENTINA.)

Bread and Bakery Products.

The newly formed Food Distribution administration of the War Food administration in its first order required that, beginning Jan. 18, 1943, all white bread in the United States must be made from enriched flour or have equivalent enrichment ingredients added to the dough. Economies were effected largely through prohibition of what was called consignment selling, whereby stale bread might be returned by the retailer, and through the establishment of maximum limits for the amounts of shortening, sugar and milk products used in the making of bread. There was a prohibition also at first against the slicing of bakers' bread, but because of consumer objections this requirement later was rescinded.

New and higher standards for levels of enrichment of flour, authorized by the Food and Drug administration, as a result of recommendations made by the Food and Nutrition board of the National Research council, were put into effect beginning Oct. 1, 1943. Simultaneously, enriched bread was required to have higher levels of enrichment also, although the proposed standards of the Food and Drug administration had not up to the close of 1943 officially been put into effect. Enriched flour was required to have in each pound not less than 2.0 mg. of thiamin, 1.2 mg. of riboflavin, 16.0 mg. of niacin and 13.0 mg. of iron. Enriched bread was required to have not less than 1.1 mg. of thiamin, 0.7 mg. of riboflavin, 10.0 mg. of niacin or its amide and 8.0 mg. of iron to the pound. There were maximum levels of enrichment for both products and also standards for enrichment with calcium and vitamin D, but the addition of these dietary essentials was optional.

In line with recommendations of the Baking Industry Advisory committee to the War Food administration, an order was drawn up extending enrichment to all yeast-raised products and doughnuts, to the extent of their white flour content. The effective date of the order was to be May 1, 1944, when it was believed sufficient supplies of the necessary vitamins and minerals would be available.

It was estimated that approximately 12,000,000,000 loaves of commercial bread are baked annually, and the total flour consumption of the baking industry amounts to approximately 60,000,000 bbl. a year.

In Great Britain "national wheat meal" of 85% extraction continued to be used and this, of course, produced a brown loaf of bread. The British ministry of food required that seven ounces of calcium carbonate be added to each sack of flour, the idea being that this calcium would counteract the phosphorus bound in the form of phytic acid in the long extraction flour and would also contribute to the nutritive value of the product. Because of the need to conserve wheat which, of course, had to be imported, and in order to take advantage of the availability of home-grown potatoes, the British ministry of food in 1943 encouraged the consumption of potatoes as a substitute for bread. Through the ingenuity of British bakers considerable quantities of mashed potatoes or potato powder were used, especially in cake and confectionery products.

In Eire, where for two years all flour had been required to be 100% extraction, that is whole-wheat flour, it was decided late in 1943 to permit the use of 85% extraction flour, although whole wheat flour was still made available to those who wished to use it. (*See* FLOUR AND FLOUR MILLING.) (F. C. Bg.)

Breadner, Lloyd Samuel

(1894–). Canadian airman, born July 14, at Carleton Place, Ont. He was educated at Ottawa. He had a distinguished record in World War I, becoming a flight sublieutenant in the royal naval air service in 1915. He later transferred to the royal air force, and by Nov. 1918 had attained the rank of major (equivalent to the present rank of squadron leader). From Oct. 1920, Air Marshal Breadner was associated with the royal Canadian air force, becoming certificate examiner to the air board. In 1922, he became director of civil aviation and had much to do with shaping civilian and commercial flying in Canada between the two world wars. From 1928 onward, however, he was drawn

into military aviation, serving as acting director of the R.C.A.F. till 1932. In 1936, he became air staff officer at National Defense headquarters, and in 1939 he accompanied Hon. J. A. Crearar to England to confer with the British government. In 1940, he was made air vice-marshal, and chief of air staff. He became air marshal in 1940 and on Nov. 11, 1943, was named air officer commanding the R.C.A.F. overseas. (J. I. C.; S. LEA.)

Brereton, Lewis Hyde (1890–), U.S. army officer, was born June 21 in Pittsburgh, Pa., and graduated from the naval academy at Annapolis, 1911. Two days after he was commissioned as an ensign he resigned to become a lieutenant in the army's coast artillery corps. He took flight training in 1912, served as a pilot in the Philippines and commanded one of the first U.S. flying units on the western front during World War I. A pioneer in the development of dive-bombing, he commanded in 1922 the first aviation attack group in the army air corps. He was in command of an airfield in the Canal Zone, 1931–35, and was transferred from his air command at the Tampa field in July 1941 to head the army air force in the Philippines. After fighting a losing battle against Japan's quantitative plane superiority there, he was made chief of U.S air forces in India. Transferred to the middle east in July 1942, as U.S. air commander, he co-operated with the R.A.F. in joint attacks on axis military and supply bases. On Feb. 6, 1943, he succeeded Lieut. Gen. Frank M. Andrews as U.S. commander in the middle east. He was replaced by Maj. Gen. Ralph Royce in September on his appointment to an undisclosed post. The low-level U.S. bombing raid on the Ploesti refinery in Rumania was carried out at Gen. Brereton's order.

Brewing and Beer. The generic word beer covers the malt beverage group, including beer, ale, porter, etc. Malt beverages are sold in all of the states of the U.S.A. under regulation and licence. They are taxed by the federal and state governments and in scattered cases local taxes are imposed. Aside from taxation, control is vested in the states, which generally treat beer apart from distilled liquors because of its low alcoholic content.

The industry's production and sales statistics are based on United States internal revenue reports of tax-paid withdrawals (sales) for the fiscal years ending June 30. As cited here, the reports cover the period after beer's relegalization by act of congress effective April 7, 1933 (which preceded the effective date of repeal of the prohibition amendment by eight months). On June 30, 1943 there were 470 breweries in the United States as compared with the peak of 750 in 1935.

Sales Records.—Following are the sales records in U.S. barrels (31 gal.) by fiscal years ending June 30: 1933 (85 days) 6,277,728; 1934, 32,266,039; 1935, 42,228,831; 1936, 48,759,840; 1937, 55,391,960; 1938, 53,926,018; 1939, 51,816,874; 1940, 53,014,230; 1941, 52,799,181; 1942, 60,856,219; 1943 (official but not audited), 68,491,045.

Per capita consumption was 15.5 gal. as compared with 14 gal. in 1942.

Package sales, considered significant of increased home use, continued to gain in 1943 when 60% of all beer was sold in bottles or cans (canned beer was available only for the armed forces overseas). In 1934 75% of all beer was sold in draught barrels.

Taxes.—Federal excise and special taxes on beer for the fiscal year 1943, ending June 30, totalled $458,872,516. Cumulative taxes after relegalization, April 7, 1933, totalled $2,905,952,782. The federal beer revenue is at the rate of $1,250,000 per day. State and local taxes and licence fees in 1943 were estimated at $150,000,000. After relegalization the combined public revenues from beer approximated $4,000,000,000.

War Conditions.—In addition to contributing to the war effort through payment of enormous taxes, aiding morale and in other ways, the beer industry used surplus farm crops not required for defense purposes and was virtually non-competitive with any defense activities. It required no imported raw materials and the export of beer and ale exceeded the imported finished product. Because of the war, world production and consumption reports for this industry were no longer available.

Industry features for 1943 were: 7% of available brewing malt was diverted for manufacture of industrial alcohol for munition needs; 15% of remaining malt supply was allocated, by government order, for brewing beer for the armed forces; purchase of new bottles was limited to 65% of 1942 orders; local and cross-country transportation of beer was voluntarily curtailed; an industry-wide program for equitable distribution had considerable success in meeting extraordinary problems of civilian requirements and population shifts to war production centres; brewers also co-operated with government agencies in eliminating black markets.

Valuable By-Products.—Wartime need for intensified conservation of food resulted in an industry campaign with government co-operation for the conservation and greater utilization of brewery by-products—chiefly brewers' yeast and brewers' spent grains. One-third, dry weight, of grains used by brewers was returned to the farmer as a concentrated protein-rich feed for livestock, particularly dairy cattle. Recovery was estimated at nearly 60 lb. (wet weight) per barrel of beer. In the calendar year 1943, it was estimated that an equivalent of 2,250,000 tons of wet grains were fed to stock throughout the United States. About a third was dried for long-distance transportation.

Because brewers' yeast is one of the richest natural sources of vitamins of the B complex group and is rich in nutritive proteins, the industry, in co-operation with U.S. War Food administration and the National Research council, set up a program for intensified processing and drying of this yeast for use as a concentrated food for the armed forces and war workers and for the Allies overseas.

Moderation and Law Observance.—The war and navy departments reiterated their policy of making mild beer available in the post exchanges and canteens at army and navy bases and opposed efforts to prohibit beer to the armed forces. The U.S. Office of War Information made a coast-to-coast survey of drinking conditions in and around army camps in 1943 and reported:

(1) There is not excessive drinking among troops, and drinking does not constitute a serious problem.
(2) Sale of 3.2 beer in post exchanges and training camps is a positive factor in army sobriety.
(3) No American army in all history has been so orderly.

The industry's army and navy co-operation program, initiated with the enactment of Selective Service in 1940, was intensified in 1943. Sponsored by the Brewing Industry foundation, the program enlisted the aid of brewers, wholesalers, retailers and their associations for co-operation with military and civil authorities in maintaining wholesome conditions where beer was sold, particularly in the vicinity of military posts. The war and navy departments officially advised commanding officers of posts and stations to make use of the program wherever conditions required it. (*See* also LIQUORS, ALCOHOLIC.) (H. HY.)

Bricker, John William (1893–), U.S. politician, was born Sept. 6 in Madison county, Pleasant township, O. He was graduated from Ohio State university, 1916, and took his law degree there in 1920. During World War I, he served as a 1st lieutenant in the U.S. army.

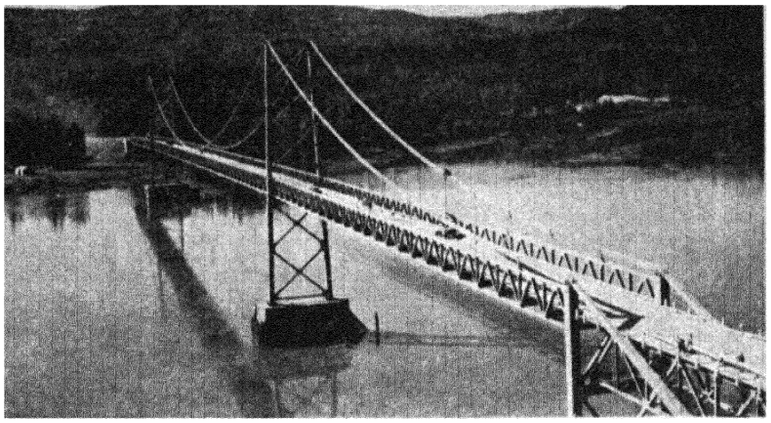
Upon his return to civilian life he entered public service as solicitor for Grandview Heights, O., 1920–28, and was assistant attorney general of Ohio, 1923–27. In 1929 he became a member of the public utilities commission, serving in that capacity until 1932; he was attorney general for Ohio, 1933–37. Elected governor of Ohio in 1939, he was twice re-elected to the same office. Bricker announced in Nov. 1943 his candidacy for the Republican nomination for president. At the same time he also declared that he did not intend to seek a fourth term as governor of Ohio.

Bridge, Contract: *see* CONTRACT BRIDGE.

Bridges.

The world's longest spans of the various types in 1943 are listed in the table.

World's Longest Spans



Type	Bridge	Location	Year	Span
Cable Suspension	Golden Gate	San Francisco	1937	4,200 ft.
Eyebar Suspension	Florianópolis	Brazil	1926	1,114
Self-Anchored Suspension	Cologne-Mülheim	Germany	1929	1,033
Cantilever	Quebec	Canada	1917	1,800
Steel Arch	Kill van Kull	New York City	1931	1,652
Steel Fixed Arch	Rainbow	Niagara Falls	1941	950
Concrete Arch	Sando	Sweden	1943	866
Continuous Truss	Duisburg	Germany	1935	839
Simple Truss	Metropolis	Ohio river	1916	720
Wichert Truss	Homestead	Pittsburgh	1937	533½
Continuous Girder	Mangfall	Germany	1935	354
Vertical Lift	Cape Cod canal	Massachusetts	1935	544
Swing Span	Fort Madison	Mississippi river	1927	525
Bascule	Sault Ste. Marie	Michigan	1914	336
Masonry Arch	Plauen	Saxony	1905	295

The outstanding structural achievement of 1943 was the completion of the Sando bridge over the Angerman river in Sweden, with a span length of 866 ft., which makes it the world's greatest concrete arch span. (*See* table.) The previous record was held by the concrete arch bridge at Esla, Spain, with a span length of 645 ft., completed in 1940. The Sando bridge, commenced in 1938, collapsed in its initial construction stage in 1939, with the loss of 18 lives, due to failure of the falsework centring during pouring of the concrete. Finally completed, it was dedicated in July 1943, by the crown prince of Sweden.

The Peace River bridge on the new Alaska highway in British Columbia was dedicated on Aug. 30, 1943, by American and Canadian officials. It is a suspension bridge of 930 ft. main span, costing $1,500,000. The concreting for the main piers had to be executed at temperatures 40 degrees below zero. The work of erecting the main towers went forward on the ice, which was several feet thick, but had to be completed before the break-up of the ice in April. The structure was completed in a total construction time of eight months, fighting ice and snow, wind and floods. The bridge was built under the direction of army engineers for the U.S. government, and was then turned over to Canada.

A lift span that goes down instead of up is in Iraq, spanning the Shatt-al-Arab (River of the Arabs) formed by the confluence of the Tigris and Euphrates rivers a few miles above the Persian Gulf. It was conceived and built (1942–43) by the royal engineers of the British army. The span, accommodating both rail and road traffic, is 92 ft. long and weighs 35 tons. It is lowered 20 ft. below the surface of the water, instead of being raised above it to permit ships to pass. The span is balanced by counterweights passing over the towers and is raised or lowered by hand-operated hoists, one at each corner, with several men working each hoist. This unique design was adopted for economy, in order to dispense with the high towers ordinarily required.

The new $6,500,000 high level toll bridge over the Thames river, connecting New London with Groton, Conn., was opened in Feb. 1943. The structure, of 5,926 ft. total length, has a central

THE PEACE RIVER BRIDGE of the Alaska highway in British Columbia was completed in the summer of 1943

cantilever section 1,240 ft. long with 352½ ft. anchor arms and a channel span of 540 ft. of which 216 ft. is a simple suspended truss. Balanced erection over the main piers was used, so as to require a minimum of falsework. Opened at a time of greatly reduced traffic, the bridge faced an immediate deficit in its first months of operation.

The city of Los Angeles completed in 1943 a $5,000,000 viaduct project, crossing the Los Angeles river at Aliso street. The channel span is a 222-ft. fixed, reinforced concrete arch with six ribs. The reinforced concrete viaduct includes a rigid-frame span which is continuous on each end with an 80-ft. anchor span, all of hollow box-girder construction; also 19 rigid-frame approach spans. This is the most notable of numerous crossings of the Los Angeles river channel, which traverses the city's industrial district. It was financed jointly by city, county, state, the three railroad companies, and the U.S. Work Projects administration.

The War Production board, in July 1943, ordered the city of Chicago to halt construction of a $1,100,000 bridge, a double-leaf bascule, spanning the south branch of the Chicago river at South Canal street. The stop-construction order was issued because it appeared that existing bridges could serve the area for the duration of the war and that use of critical materials required for completion of the project was unwarranted during the emergency.

The new Coastal highway in Georgia has a deck bridge 2,382 ft. long, under construction 1942–43 at a cost of $550,000, in the vicinity of Savannah. The main river crossing of this bridge has two sets of 91-150-91-ft. span continuous plate girders, flanked by simple girder spans and 36 reinforced concrete deck girder approach spans. The approaches to the structure are over soft material that had to be removed by dragline immediately ahead of a pumped fill and embankment.

During 1942 and 1943, no large steel bridges were undertaken in the U.S. The emphasis was on timber substitutes, because of the shortage of steel caused by war requirements.

In Pennsylvania, a highway bridge with six 129-ft. truss spans of timber with steel gusset plates was constructed over a channel of the Ohio river near Pittsburgh. The structure is supported on timber piers carried on piles and rock-filled cribs. The timber cribs to encase the wood piling were floated into place and sunk in a swift current. The timber trusses were assembled on barges and erected one at a time by a floating rig. This bridge illustrates how timber may be combined with a small amount of steel to produce a semi-permanent structure. The spans are designed to carry 13-ton trucks and 30-ton street cars.

In Portland, Ore., to save steel, a highway bridge bulit in 1942 has spandrel-braced three-hinged timber arches of 88-ft. span. The deck is of planking, surfaced with asphaltic concrete.

For salvage of the steel and the wire, the cables and the towers of the wrecked Tacoma Narrows bridge were taken down in 1943. The 232-ft. span of the Central viaduct spanning the Cuyahoga river at Cleveland was blasted to fall shoreward and to

carry the bridge toward land for easy salvage of the steel.

During 1943, the methods of the bridge engineer, both in types of span and methods of erection, dominantly invaded the field of wartime structures wherever large roof spans were required. At the Lakehurst, N.J., naval air station, the methods and equipment used for steel erection were adapted to the construction of a timber arch hangar, of 246-ft. arch span, 170 ft. high and 1,000 ft. long, for the housing of blimps. Fireproofed wood was used. At two other locations, the U.S. navy built large blimp hangars of steel arch framing, using a large number of steel arch trusses of 328-ft. span and 185-ft. rise. The arches are all-welded, except for the field splices. Scarcity of steel resulted in the use of glued, laminated timber arches of 120-ft. span for a drill hall at a navy training centre in Maryland, and similar laminated timber arches of 70-ft. span for a recreational centre at a west coast navy yard. Timber bowstring trusses of 160-ft. span were built to support the roof of a hangar under construction 1942–43 near an eastern city for the U.S. army. The arched top chords of the timber roof trusses were built up of laminated, glued and spiked small members, and the bottom chords were heavy timbers spliced for tension.

The annual Artistic Bridge awards of the American Institute of Steel Construction, also the annual student competition in artistic bridge design, were suspended in 1943 for the duration of the war. (D. B. S.)

Bridgman, George B. (1864–1943), U.S. artist and art teacher, was born Nov. 5 in Bing, County of Monk, Canada, the son of a portrait painter. He studied painting in the United States and in academies in Paris and later taught art in Buffalo. His work, *Constructive Anatomy*, published in 1920, was regarded as an anatomical bible by thousands of U.S. artists. Bridgman taught at the Art Students league, New York city, 1899–1943. He died in New Rocnelle, N.Y., Dec. 16.

Briquettes, Fuel: *see* FUEL BRIQUETTES.
British Borneo: *see* BRITISH EMPIRE.

British Columbia. The most westerly province of Canada, bordering on the Pacific ocean. The crown colonies of Vancouver Island (1849) and of British Columbia (1858), after uniting in 1866, entered the Canadian confederation in 1871 to form the province. Area, 366,255 sq.mi., of which 6,976 sq.mi. are water. The total population of 817,861 (1941) was divided between 443,394 urban and 374,467 rural dwellers. Vancouver (275,353), Victoria, the capital (44,068) and New Westminster (21,967) lie in the southwestern corner—not far from the United States border. After the dominion census of 1941, the population status of many British Columbia centres changed, owing to increase of war industries. Based on ration book distributions, the population of Greater Victoria (including the municipalities of Sannich, Oak Bay and Esquimalt) was 82,390 in 1943; New Westminster (including parts of adjoining communities) 36,778; Vancouver city 306,167, and Prince Rupert 11,926.

History.—In Jan. 1943, the Hon. H. G. T. Perry, chairman of the postwar rehabilitation council, presented an interim report on work of that committee. John Hart, premier and minister of finance, in his budget address stated that provincial revenues during 1941–42 had established a new all-time record and amounted to $38,763,546, a sum $2,509,610 greater than that collected during the previous year. Expenditures amounted to $31,342,923. Estimated revenue collections amounting to $31,987,537 and expenditures therefrom of $31,792,446 were anticipated for the fiscal year 1943–44. A reduction of $12,329,857 in the gross debt of the province for the fiscal year ended March 31, 1943, was also announced by Mr. Hart. The remaining members of the provincial cabinet in 1943 included: G. S. Pearson, provincial secretary, labour and fisheries; R. L. Maitland, attorney-general; A. W. Gray, lands and municipal affairs; E. C. Carson, mines and trade and industry; H. G. T. Perry, education; H. Anscomb, public works and railways; K. C. MacDonald, agriculture.

Economic Activity in British Columbia, 1941-43

	Unit	1941	1942	1943 (est.)
Agriculture:				
Total value of production	$	58,577,539	73,748,235	77,500,000
Livestock	$	7,472,000	9,324,000	10,000,000
Poultry products	$	6,085,000	8,806,000	9,500,000
Dairy products	$	16,209,733	17,662,371	18,000,000
Fruits and vegetables	$	11,782,076	16,686,089	19,000,000
Field crops	$	14,552,000	18,137,000	18,500,000
Miscellaneous	$		3,132,775	2,500,000
Fisheries:				
Total value of production	$	31,732,037	38,059,559	32,500,000

Index of employment	1926=100	135.6	164.8	190.0

A rural electrification committee was formed to survey and report upon the extent and condition of electrical services in the province, with particular reference to the servicing of rural areas. The Public Utilities commission presented to the lieutenant-governor-in-council its report on the operation of the British Columbia Electric Railway Co., Ltd., The company provides electricity, gas and transportation services in Vancouver, the lower mainland of British Columbia and in Victoria, and electricity and water services in other parts of the province. Resulting from the report, and as a temporary war measure, an order was made providing for free electric service for one month in Vancouver and lower mainland areas, and two months in other parts of the province served by the company.

Education.—During the school year ending June 30, 1942, 118,405 students were enrolled in the elementary (78,221), junior high (14,758), superior (3,242) and high (22,184) schools of the province. Teaching staffs comprised 2,643 teachers in elementary, 540 in the junior high and 1,041 teachers in superior and high schools.

Communication.—Provincial highways in 1942 totalled 21,595 mi. and included 8,966 mi. of surfaced, 10,069 mi. of improved earth and 2,567 mi. of unimproved earth roads. Railway mileage amounted to 3,883 mi. of single track in the same year. The total number of telephones, 162,815, included 56,847 on automatic switchboards.

Manufacturing, Agriculture, Mineral Production.—Although affected by the growing shortage of manpower and rising production costs, business activity in British Columbia during 1943 maintained the relatively high level of 1942. Production in the basic industries reached an estimated net value of $472,000,000 in 1942 compared with $379,925,005 in 1941. Salaries and wages paid to employees in the leading industries were estimated at $302,892,946 in 1942, an increase of approximately $63,367,487 over the estimated 1941 gross pay roll of $239,525,459.

According to preliminary provincial estimates the net value of production in 1943 amounted to $77,500,000 (1942, $73,748,235) in agriculture; $32,500,000 in fisheries (1942, $38,059,559);

$125,000,000 in forestry (1942, $124,720,000) and $65,000,000 in mining (1942, $75,551,093). (W. A. C.)

British East Africa. Under this heading are grouped British colonial territories on the east coast of Africa, of which certain essential statistics are given in the table. *See* BRITISH EMPIRE for population, capital towns, status and governors. (*See* also RHODESIA.)

The East African governments in 1943 were mainly concerned with questions of manpower supply and production. The increasing prosperity of some sections of the population gave rise to fears of inflation. Native producers benefited from large sums paid regularly in allowances from thousands of Africans in military service. The cost of living had risen considerably for all sections of the community. East African troops were serving in Ceylon as well as in Africa and Madagascar, after taking a distinguished part in the victorious African campaigns. Owing to manpower shortage, recruiting for military service practically stopped.

Kenya.—The colonial office announced projects for development involving an expenditure of £20,000,000, all of which, with the exception of a loan of £500,000, would be in the form of grants under the Colonial Development and Welfare act. The scheme involved measures for soil conservation, African housing, water supplies, agricultural and educational projects, reafforestation and reclamation of tsetse fly areas. The colony in addition was preparing a five-year construction program to cost another £2,000,000 chiefly concerned with increased school and hospital accommodation. Kenya was now the world's principal source of pyrethrum seed; 20,000 lb. was sent to Russia to replant war-devastated Caucasian fields, 10,000 lb. to Brazil at the request of the U.S.A. Board of Economic Warfare. The British ministry of supply guaranteed to purchase the pyrethrum crop until 1947. Food rationing was introduced. Conscription of African labour was reintroduced for the sisal industry, after suspension when the food shortage was acute, and to supply labour for the pyrethrum and rubber industries; and a system of rationing labour was under consideration to give priority to the war effort. European women aged 25 to 40 were being called up for national service.

Uganda.—The colony celebrated its 50th year of British rule. As in Kenya the war continued to bring prosperity to the native people. The British government agreed to buy the cotton crop until the end of the war.

Tanganyika.—The British ministry of supply sent a rubber expert to advise on the production of native rubber. Many old plantations were revived and research was undertaken at the Amani research station. An American naval sisal commission was sitting in Dar-es-Salaam and the U.S. authorities urged the need for greater production of this essential crop. The government undertook extensive measures for tsetse fly control. A survey of unworked coalfields was being carried out.

Zanzibar.—The clove industry again showed a record export. Zanzibar and also Mauritius sent students to be trained as social workers at the London school of economics.

Somaliland.—The military government undertook famine relief measures in the Gorama district with the aid of a specially recruited labour battalion and instituted searches for new water supplies. Good rains improved grazing in October. After a Durbar held by the governor, combatant tribes were reconciled and pardons granted to persons involved in extensive thefts of camels in 1941.

Nyasaland.—Restricted shipping facilities caused a set-back in trade. The shortage of imported goods considerably increased costs and offset the increased purchasing power of the African population. The production of plantation rubber and the collection of wild rubber increased.

Mauritius.—Over a third of the cultivated lands in the island were under food crops as a result of a drive, aided by Jewish refugees, to increase cultivation. Relatively large numbers of Mauritians were serving abroad with the armed forces.

Seychelles.—Coco-nut oil, a new export, was to be exported at the rate of five tons a month from October. (J. L. K.)

British Guiana.

A British crown colony in northeastern South America. Governor (1943): Sir Gordon Lethem. The area is 89,480 sq.mi. The population (1931 census: 310,933) was officially estimated at 354,219 as of Dec. 31, 1942. East Indians constituted the largest single population element (42.7%), being proportionately greater than in any other American area except Surinam and numerically more than in any except Trinidad. Negroes aggregated 38.2% and mixed races 12.3%.

The chief cities are Georgetown, the capital (pop. est. 71,160) and New Amsterdam (pop. est. 10,137). Under the "destroyer-base agreement" of 1940 the United States continued to maintain naval air and patrol bases in the colony in 1943.

History.—During 1943 British Guiana continued to feel the ill effects of wartime disruption of trade and shipping, although less so than her sister colonies in the West Indies. The situation was aggravated by prolonged rains and floods, with January-March rainfall the heaviest recorded since 1880. Offsetting this was an increasing attention to long-term and postwar development. Thus, imperial loans and grants were made for drainage and irrigation projects totalling £118,584, extension of the cattle industry, an airport at Georgetown, land settlement and other purposes. Moreover, the colonial office in London indicated that a "considerable number of large-scale proposals" for British Guiana development were under discussion. The drainage and irrigation development, involving an expenditure of £118,584, was expected to increase materially the colony's rice production.

Education.—There were 246 primary schools (enrolment 55,076), including 60 in remote areas, and seven government-aided secondary schools. In 1943 an imperial grant of £10,450 was made for the expansion and development of secondary education in the colony.

Finance.—The monetary unit, the British Guiana dollar, tied to sterling at 4.8665 to 1, is normally equivalent to the United States dollar (1943 exchange rate: approximately 83 cents U.S.). The colony's maximum income tax rate (25%) was exceeded in 1943 in only two other British American colonies.

Trade.—Under wartime conditions some statistical data on production and trade, particularly of strategic materials such as bauxite, were not made public or were delayed.

In 1941 export values totalled $19,585,033 (B.G. dollars), an increase of 28.6% over 1940 and 33.2% over 1939. Sugar and its derivatives made up 47.1% (1939: 55.3%), followed by rice, balata and timber; unlisted commodities (bauxite, diamonds, gold, etc.) together comprised 36%. Textiles, other manufactures, and foodstuffs were the leading imports.

Import values in 1941 were $17,191,692 (B.G. dollars), 21% more than in 1940 and 68% more than in 1939. The increases, however, reflected swollen unit values more than greater volume. Canada supplied 35.0% (1939: 18%), Great Britain 23.5% (1939: 39%), the United States 21.8% (1939: 14%). These same countries were the leading customers.

Communication.—External communication, maritime and air, is normally adequate. There is no practicable external communication by land, although a highway from Brazil was under study in 1943. Within the colony, railways (79½ mi.) are confined to the coastal area, as are most of the 322 mi. of highway. Communication with the interior in 1943 was mostly by trail and navigable rivers.

Agriculture and Forest Products.—Sugar is the colony's economic mainstay, and an estimated third of the population depend directly on it. It ordinarily provides the bulk of export values. Rice production, both for local consumption and for export was being stimulated in 1943. Forest products include balata (1941: 659,190 lb.) and various hardwoods, notably the greenheart, found only in British Guiana.

Mineral Production.—War demands for bauxite were unofficially estimated in 1943 to have more than doubled the 1939 production of 476,013 tons. Diamonds (1940: 33,351 carats) and gold (1940: 35,745 oz.) are also important.

BIBLIOGRAPHY.—*West Indies Year Book, 1943; Crown Colonist* (London, monthly); *Canada-West Indies magazine* (Montreal, monthly).

British Honduras.

A crown colony of Great Britain, located on the Atlantic side of Central America east of Guatemala, north of Honduras, and south of Yucatan (Mexico). Area: 8,598 sq.mi. A portion of the eastern boundary is still disputed by Guatemala although the claim has been suspended for the duration of the war. Pop. (1942 est.) 61,068; in the last census (1931) it was 51,347. The capital is

Belize (1931 pop., 16,687); other settlements are Corozal (2,700), Benque Viejo (1,500), El Cayo (1,500). Governor in 1943: Sir John Adams Hunter.

History.—During 1943 British Honduras was affected by the war largely through shortages in shipping. A foresighted policy of licensing imports, started in 1941, had enabled the government to bring about the importation of a stock of essential commodities, with the result that British Honduras was better supplied than most British Caribbean colonies as late as the summer of 1942. The cost of living steadily increased during 1943, and rationing of rice, a staple article in the diet of the poorer classes, was necessary. Limits on profits were also imposed.

Some shortage of labour occurred in the colony since more than 3,000 workers were employed at the Canal Zone, and an additional 600 were taken into the United Kingdom services.

Education.—There were about 80 church schools and half that many private schools in operation, with an enrolment of more than 10,000 students. Most schools receive financial aid from the government.

Finance.—The monetary unit is the British Honduras dollar, normally equivalent to the United States dollar (1943 exchange value 68 cents U.S.; this rate is nominal since the currency is restricted to the colony). It is tied to the pound sterling at 4.8665 to 1. The public debt in 1941 was $12,166,756. Government revenue in 1941 was $1,370,900, and expenditure $1,378,100.

Trade and Resources.—Exports for 1941 were valued at $3,357,546 (British Honduran currency); imports at $3,751,950, with a fourth of the imports re-exported. Imports are largely manufactured articles, textiles, foodstuffs and machinery, with the United States supplying about 43% in 1941. Exports are normally 80% forest products, the remainder agricultural; in 1941 about 63% of exports went to the United States. The mahogany cut for 1942 was estimated at 5,000,000 bd.ft. (1941: 7,000,000 bd.ft.). In 1941 there were 337,499 stems of bananas exported, 250 tons of sugar (1941–42 quota year), citrus fruits and fruit products to the amount of 11,526,000 lb., 2,444,508 coconuts, 362,811 lb. of copra and 1,564,337 lb. of chicle.

Communications.—In normal times Belize is connected with other ports by steamer service, and by air to Honduras and Mexico. Most transportation within the colony is by boat. Approximately 150 mi. of road exist; a former 25 mi. railway has been converted into a road. (*See* also WEST INDIES, BRITISH.)

British Legion. This national organization of men and women of all the fighting services drew into honorary membership 300,000 members of the forces serving in the British Isles or overseas in World War II. A hundred thousand of the new generation of sailors, soldiers and airmen discharged in the course of hostilities became full members and 1,750 of these were serving on branch committees. Working through the ministry of pensions advisory committee and its house of commons branch, the Legion had in 1943 succeeded in getting independent pensions appeal tribunals set up and won substantial improvements in pensions regulations. Its next objective was a preference in employment after the war for those who served, similar to the pledge given by the government after World War I. The Legion's rehabilitation work was extended during the year by the acquisition of Nayland Hall sanatorium and workshops, near Colchester, for women discharged from the women's auxiliary services suffering from tuberculosis. Its women's section, with the record number of 1,927 branches, opened a convalescent home at Knaresborough, near Harrogate. Brig.-General E. R. Fitzpatrick became chairman of the Legion and Lady Apsley M.P. was re-elected chairman of the women's section.

History.—The protectorates had in 1943 more than 40,000 men in the Auxiliary Military Pioneer corps, many of them serving in the Mediterranean theatre of war. Large sums were subscribed by the native people for comforts for their serving men, and in Basutoland the native government imposed a war levy for this purpose of £5 a head on chiefs and 10*s.* on the ordinary taxpayer.

Chief Griffith of Basutoland died leaving a son, a minor, and was succeeded by his wife Chieftainess Mantseho as regent paramount.

The encouragement given by the Empire Cotton-Growing corporation to cotton growing in Swaziland produced successful results.

In Bechuanaland an irrigation scheme was completed and named after a local chief the Bathoen II irrigation dam. Its capacity is 390,000,000 gal.

Part of the production from the irrigated area was to provide a free meal daily for the school children of a large area. (J. L. K.)

British-U.S. War Boards. **Combined Food Board (United States, United Kingdom and Canada).**—Acting jointly, the president of the United States and the prime minister of Great Britain on June 9, 1942, authorized the creation of the Combined Food board to obtain a planned and expeditious utilization of the food resources of

the United Nations. In Oct. 1943, Canadian Prime Minister MacKenzie King accepted membership on behalf of the government of Canada.

The board was established to investigate and formulate plans with regard to any question relating to supply, production, transportation, disposal, allocation or distribution, in or to any part of the world, of foods, agricultural materials from which foods are derived and equipment and non-food materials ancillary to the production of such foods and agricultural materials

The chairman of the board in 1943 was U.S. Secretary of Agriculture Claude R. Wickard. The U.S. member was Marvin Jones, war food administrator; the United Kingdom member was R. H. Brand, head of the British food mission; the Canadian member, J. G. Gardiner, Canadian minister of agriculture.

Combined Production and Resources Board (United States, Great Britain and Canada).—The creation of the Combined Production and Resources board was announced by President Roosevelt June 9, 1942. The board was established by the president of the United States and the prime minister of Great Britain in order to complete the organization needed for the most effective use of the combined resources of the United States and the United Kingdom for the prosecution of the war. On Nov. 10, 1942, the board was expanded to include a Canadian member. The board was to utilize the Joint War Production staff in London, the Combined Raw Materials board, the Joint Aircraft committee and other combined or national agencies for war production.

Members for the United States in 1943 were Donald M. Nelson, chairman of the War Production board; Charles E. Wilson, executive vice chairman of the WPB (deputy member); W. L. Batt, vice chairman, International Supply of WPB (deputy member); Fredrick M. Eaton, Solicitor of the WPB (executive officer) and Philip D Reed, London representative of the lend-lease coordinator. Members for Great Britain were Oliver Lyttelton, minister of production; Sir Henry Self, representative of the minister of production (deputy member); T. H. Brand, representative of the war cabinet secretariat in London (executive officer) and P. Hayward, representative of the ministry of production (secretary). Members for Canada were C. D. Howe, minister of munitions and supply; Edward P. Taylor, Canadian representative of the department of munitions and supply (deputy member) and Sydney D. Pierce, representative of the department of munitions and supply, Washington office (executive officer). W. M. Black was executive director of the combined staff.

Combined Raw Materials Board (United States and Great Britain).—The establishment of the Combined Raw Materials board was announced Jan. 26, 1942. The board was given a comprehensive responsibility for the planning of the raw materials effort of the two countries and for collaborating with the other United Nations to provide for the most effective utilization of all raw material resources at their disposal.

The activities of the board were to include over-all review of the supply and requirements position of the United Nations for the major critical and essential raw materials, allocation of supplies of scarce raw materials among the United Nations when necessary, recommendations aimed at expanding supplies and conserving the use of raw materials in short supply and coordinating the purchasing activities of the United States and Great Britain in foreign raw material markets.

Members of this board in 1943 were William L. Batt, United States member; Fredrick M. Eaton, deputy member and United States executive secretary; George Archer, deputy member and United Kingdom executive secretary. The United Kingdom full membership was vacant as of Nov. 1943.

Combined Shipping Adjustment Board (United States and Great Britain).—Creation of the Combined Shipping Adjustment board was announced Jan. 26, 1942. The function of the board was to co-ordinate the work of the British ministry of war transport and the War Shipping administration.

Members for the United States in 1943 were Rear Admiral Emory S. Land, chairman of the U.S. Maritime Commission and administrator of the War Shipping administration and David E. Scoll, assistant to the administrator of the War Shipping administration (executive officer). Members for Great Britain were Sir Arthur Salter, head of the British Shipping mission in the United States, W. O Hart, British executive officer and Lord Leathers, administrator of war transportation in London.

Munitions Assignments Board (United States and Great Britain).—This board's establishment was also announced Jan. 26, 1942 The United States section of the board, working in close collaboration with the corresponding London organization, maintained full information of the entire munitions resources of Great Britain and the United States and translated such resources into terms of combat forces and their material reserves. It submitted such statements to the combined chiefs of staff, keeping the estimate up to date in the light of war developments and variations in production achievements and prospects. It kept the combined chiefs of staff informed and recommended measures necessary that planned requirements programs may be in line with strategic policy, changing operations conditions in their effect on war material and the realities of production. The United States section was responsible for making assignments of stocks and production of finished war material to the United States and Great Britain and to others of the United Nations.

Members for the United States in 1943 were Harry L. Hopkins, chairman; Admiral J. M. Reeves; Rear Admiral W. R. Purnell; Rear Admiral O. C. Badger; Lt. Gen. Brehon B. Somervell; Maj. Gen. B M. Giles; Brig. Gen P. H. Tansey; Maj. Gen. J. H. Burns, executive and Capt. W. S Gubelmann, secretary. Members for Great Britain: Admiral Sir Percy Noble; Lt. Gen. G. N. Macready; Air Marshal Sir William L. Welsh and Wing Comdr. T. E H. Birley, secretary. (*See* also CANADIAN —U.S. WAR COMMITTEES.)

British West Africa.

Under this heading are grouped the British colonial territories on the west coast of Africa, for which certain essential statistics are given in the accompanying table. *See* BRITISH EMPIRE for population, capital towns, status and governors.

With the immediate danger of war removed from West Africa in 1943 the colonial governments of the four colonies were pressing ahead with plans for social and economic development. Advisers for development (Noel Hall) and town planning (Maxwell Fry) were appointed to the staff of the resident minister. Colonel Oliver Frederick Stanley, the secretary of state for the colonies, visited all four colonies during 1943 and discussed local problems with leading Africans and Europeans. On his return, Colonel Stanley stated in the house of commons that he had asked each territory to prepare plans which could be put into operation when the war ended, and if necessary finance could be found under the Colonial Development and Welfare act.

A commission of inquiry into higher education in West Africa, with three African members to represent Nigeria, the Gold Coast and Sierra Leone, was appointed with Colonel Walter Elliot as chairman. The commission was to work in liaison with Sir Cyril Asquith's commission concerned with higher education throughout the colonial empire. The British council established an organization to cover British West Africa, with headquarters in the Gold Coast under the direction of W. H. Macmillan. The council was to establish cultural institutions in each of the colonies. An

important political move was the appointment of unofficial members, including Africans, to the executive councils in Nigeria and the Gold Coast. Much attention was paid to production of all kinds to increase the contributions of minerals and tropical produce, including rubber, to the Allied war effort. West African troops were serving in India, including the West African frontier force which had won distinction in the East African campaigns against the Italians. This was the first time that a British West African force had served overseas.

Nigeria.—Sir Arthur Richards, formerly governor of Jamaica, in Dec. 1943 succeeded Sir Bernard Bourdillon as governor. A government committee recommended the appointment of Africans to the administrative service following the example set by the Gold Coast. A labour advisory board on which commercial employers and employees were represented was appointed to effect an improvement in rates of pay.

Gold Coast.—A grant of £127,000 under the Colonial Development and Welfare act made possible the formation of an institute of West African arts, industries and social science at Achimota college. The development of Achimota toward full university status was to be considered by the Elliot commission. Much attention was paid to the improvement of educational facilities, including the pay and pensions of teachers. A new town council for Accra was to have a majority of elected members. Sir Ofori Atta, a leading paramount chief, died, and was succeeded by Chief Opoku Akyeampong. Investigations were being carried out into cocoa diseases, particularly the "swollen root" disease.

Sierra Leone.—Freetown harbour played a vital part in the Allied war effort and the European population of the town increased from 200 before the war to several thousand. Transport and harbour facilities were improved, and higher grade iron ore was shipped at the rate of 8,000 tons a tide. Colonial development and welfare grants were made for women's education, for scholarships for students to Great Britain, and for the improvement of Fourah Bay college. A number of African women teachers were sent to England for training.

Gambia.—The sum of £30,000 was granted under the Colonial Development and Welfare act for the improvement of Bathurst harbour. The educational system was reviewed and substantial assistance provided to improve the conditions of service of teachers. The British government agreed to purchase the groundnut crops for 1943–44. A scheme whereby grain was marketed under government control greatly benefited the community as a whole.

St. Helena.—Colonial development and welfare grants were made for the improvement of women's education and the establishment of a public library in Jamestown. The increased demand for local produce owing to restrictions on imports led to a larger area of land being cultivated with assistance from the agricultural department.

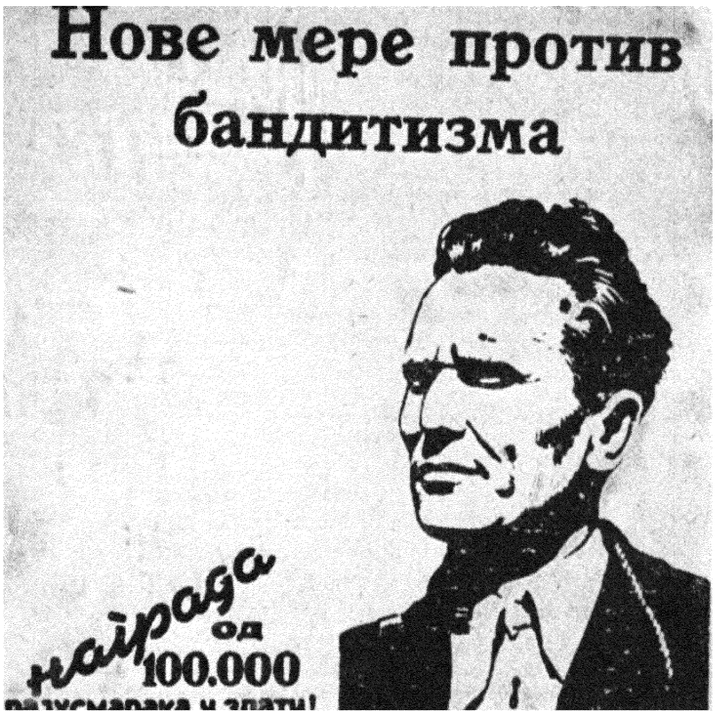
Bromine. The series of increased outputs that prevailed after 1933 and brought the production of bromine in the United States in 1941 to 34,159 short tons, from 14 plants, was broken in 1942 by a decline to 32,940 tons. The production of bromine as a by-product of the recovery of magnesium in sea water was expected to contribute a further increase in 1943.

(G. A. Ro.)

Brooke, Sir Alan Francis (1883–), British army officer, was born at Baguères de Bigorre, France, on July 23, the son of Sir Victor Brooke. After completing his studies at the royal military academy, Woolwich, he joined the royal field artillery in 1902. He was stationed in Ireland from 1902 to 1906, then India. At the outbreak of war in 1914 he went to France. Advancing rapidly, he was soon recognized as an authority on artillery and was a general staff officer of the royal artillery at the time of the armistice. After the war he joined the staff college, Camberley, and the imperial defense college, and from 1929 to 1932 he was commandant of the school of artillery. After duty at various other military posts he was appointed in 1939 commander in chief of the anti-aircraft command. When Germany invaded the Low Countries on May 10, 1940, Brooke was commander of the B.E.F. 2nd corps in France. His guarding of the British retreat from Flanders was an important factor in the successful evacuation at Dunkirk. Back in England early in June, he hastily reassembled British military man power for the expected nazi invasion and prepared a formidable series of defense zones. For his work in Flanders he was knighted, and on July 19, 1940, he was appointed to succeed Sir Edmund Ironside as commander in chief of the home forces. On Nov. 18, 1941, Brooke succeeded Sir John Greer Dill as chief of the British imperial general staff. He accompanied Churchill to Washington in June 1942, to Moscow in Aug. 1942, and to conferences in Washington, Quebec, Cairo and Tehran in 1943.

Brooke, Sir Basil (1888–), British statesman, was born June 9, heir to a baronetcy established in 1822 and nephew to Gen. Sir Alan Brooke, who distinguished himself in both World Wars I and II. Educated at Winchester and Sandhurst, he entered the army and served throughout World War I, receiving the Military Cross and the Croix de Guerre with Palm. In 1929 he was elected to the Northern Ireland parliament, and in 1933 he became minister of agriculture and privy councillor. He resigned from the former



post in 1941, when he became minister of commerce. On May 1, 1943, he succeeded John M. Andrews as prime minister of Northern Ireland, still retaining his commerce portfolio. Well known for his hostility to Irish Catholics, he announced soon after his appointment that Northern Ireland planned a program of closer cooperation with Great Britain in the war effort.

Brookings Institution. The institution in 1943 conducted a program of research which was in large measure related to the war effort and postwar problems. Book-length studies included the following: *World Minerals and World Peace*, by C. K. Leith, J. W. Furness and Cleona Lewis, dealing with the distribution of essential minerals and its bearing on the maintenance of world order; *The New Philosophy of Public Debt*, by Harold G. Moulton, analyzing the belief that continuous deficit spending is essential to prosperity; and *Belgian Banking and Banking Theory*, by B. S. Chlepner, the development of Belgian banking in the light of modern theory The series, *Price Making in a Democracy*, by Edwin G. Nourse, was continued by the publication of four additional pamphlets. Other pamphlet studies included the following: *Is There Enough Manpower?* by Harold W Metz; *Collapse or Boom at the End of the War?* by H. G. Moulton and Karl T. Schlotterbeck; *Do We Want a Federal Sales Tax?* by Charles O. Hardy; *Rationing and Price Control in Great Britain*, by Jules Backman; *The Price Control and Subsidy Program in Canada*, by Jules Backman; *How Nazi Germany Has Controlled Business*, by L. Hamburger. Because of the war, the usual fellowships for advanced study were not granted. (H. G Mo.)

Brown, Prentiss Marsh (1889–), U.S. attorney and public administrator, was born June 18 at St. Ignace, Mich. He attended Albion college and the University of Illinois. Admitted to the Michigan bar in 1914, Brown embarked upon a career in law, business and politics. He ran as Democratic candidate for congress in 1924 and for the Michigan supreme court in 1928, although unsuccessfully on both occasions. Brown was elected to congress in 1933 and was elected to the senate for the 1937–43 term While in the senate he became chairman of the democratic senatorial campaign committee and chairman of the special committee on taxation of governmental securities and salaries, 1938–40 He sponsored the important Price Control act of April 1942, and the Price Stabilization act of Oct. 1942. When he was defeated for re-election to the senate, he accepted President Roosevelt's request to succeed Leon Henderson as administrator of the Office of Price Administration in Jan. 1943. Brown warned the senate that federal subsidies were necessary to prevent price rises. After several months on the job, he was prevented by illness from actively guiding the OPA and resigned on Oct. 21, 1943.

Brozovich or Broz, Josip (Tito) (1892–), Yugoslav guerrilla leader, was born near Zagreb in Croatia. He became a metalworker, then served in the Austro-Hungarian army early in World War I In 1915 he went over to the Russians, along with thousands of his Slavic comrades. After the Russian revolution he fought in the Red army during the civil war. When he returned to Croatia in 1923, he became a labour leader and was soon imprisoned as a communist On his release he became leader of the underground labour movement, assuming the pseudonym of Tito.

After the German conquest of Yugoslavia in April 1941, Tito organized a band of guerrilla fighters. Many of the successes claimed by Col. Draja Mikhailovitch's (*q.v.*) guerrillas were

100.000 РАЈХСМАРАКА У ЗЛАТУ ДОБИЋЕ ОНАЈ КОЈИ ДОВЕДЕ ЖИВА ИЛИ МРТВА КОМУНИСТИЧКОГ ВОЂУ ТИТА.

Овај злочинац бацио је земљу у нову несрећу. Као бољшевички агент, овај сарадник царева, попова и других разбојних хтео је да обрати у земљи совјетску републику, а и тиме је уверавао да је он позван да „ослободи" народ. За остварење тога циља он се старао у шпанском грађанском рату и у Совјетској Унији, где је увезао све терористичке методе ГПУ-а, методе окривљавања културе и животињског уништавања људских живота.

Ова његова „ослободилачка активност", која је имала да утре пут бољшевизму, том најгорем политичком режиму на свету, одузела је милионе, добре па и милион хиљадама људи. Она је само пореметила мир сељака и грађанина и бацила земљу у неописану беду и невољу. Порушене цркве и спаљена села трагови су његова је он прошао

СТОГА ЈЕ ОВАЈ ОПАСНИ БАНДИТ У ЗЕМЉИ УЦЕЊЕН СА 100 000 РАЈХСМАРАКА У ЗЛАТУ

Онај који дохвати да је овог злочинца учинио безопасним или га преда најбољој немачкој власти не само што ће добити награду од 100 000 Рајхсмарака у злату, него ће тиме извршити и једно националне дело, јер ће ослободити народ и отаџбину од бича бољшевичког крвавог терора.

Врховни заповедник немачких трупа у Србији

ANNOUNCEMENT OF GERMAN REWARD of 100,000 marks for the capture dead or alive, of Josip Brozovich (Drug Tito), Yugoslav Partisan leader. I appeared in the Belgrade *Novo Vreme* July 21, 1943

said to have been won by Tito's partisans. Strong political differences led to discord and even armed conflict between the two groups. In an attempt to reconcile these factions, Allied aid was given to both. As the partisans increased in strength and ability to harass the enemy, a larger share of the supplies went to them. At the end of 1943 Tito was reputed to have a force of 250,000—more than ten times the size of Mikhailovitch's army.

Brunei: *see* BRITISH EMPIRE.

Bryn Mawr College. A resident college for women at Bryn Mawr, Pa. President in 1943: Katharine E. McBride. Bryn Mawr, while carrying on its full academic program in 1943, placed special emphasis on three interdepartmental courses for the study of postwar problems: (1) international administration and reconstruction; (2) community organization and reconstruction; (3) language for recon

struction. All three included courses in history, languages, English composition, science, philosophy, economics, geography, international relief and administration and problems of the peace. The course in international administration also required advanced history, including research training on a special region, statistics, comparative government and international organization, public administration and accounting. The course in community organization included two years work in sociology, one in psychology and statistics and one summer of field work, and one spent in a language camp. The course in language for reconstruction, in addition to French, German and another language, with two years residence in one of the language houses on the campus, offered studies in either comparative government or international organization. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (K. E. M.)

Bubonic Plague: *see* PLAGUE, BUBONIC AND PNEUMONIC.

Buckwheat.

Production of buckwheat in the United States in 1943 was estimated by the United States department of agriculture at 8,830,000 bu. compared with 6,636,000 bu. in 1942 and an average of 6,687,000 bu. for 1932–41. This was an increase of about 25% which resulted from an above-average yield on a larger acreage. The principal buckwheat growing states, New York and Pennsylvania, harvested most of the increase, New York having particularly good yields. Frosts came late enough to allow the late-sown buckwheat to mature.

Estimated U.S. Production of Buckwheat in Leading States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
New York	3,274,000	2,257,000	Wisconsin	261,000	210,000
Pennsylvania	2,508,000	2,145,000	West Virginia	209,000	209,000
Michigan	800,000	391,000	Maine	140,000	119,000
Minnesota	442,000	420,000	Maryland	105,000	98,000
Ohio	350,000	216,000	Virginia	98,000	128,000

(J. C. Ms.)

Budget, National

On Jan. 13, 1944 President Roosevelt submitted his third war budget to congress, covering the fiscal year 1945. This budget was designated by the president as the outline of financial requirements for victory. It also outlined some of the measures which the president desired to assist in the reconversion of the economy to peacetime pursuits and to help military personnel and war workers find their way back into peacetime employment.

The budget estimates for the fiscal year 1945 were all based upon the assumption that the war would continue in the west as well as in the east throughout the fiscal year. This did not, of course, carry any implication as to the president's real expectations of the length of the war; it meant only that there was no other safe assumption upon which the government could plan its operations. Because of this assumption and because the scale of government operations in the fiscal year 1944 was already geared to an all-out war effort, there was little change shown in the expenditures' side of the government accounts.

The budget for the fiscal year 1945 anticipated a total of federal expenditures of approximately $100,000,000,000, only slightly more than the estimates for the fiscal year 1944. The anticipated expenditures for war activities of $88,200,000,000 were virtually the same as in the 1944 fiscal year, indicating that the government's war effort was already at about its maximum. Expenditures directly associated with the war completely dominated the entire budget, accounting for almost nine-tenths of total expenditures.

In explaining the war expenditures estimate for the fiscal year

CARTOON by Shoemaker in the *Chicago Daily News* inspired by President Roosevelt's budget message of Jan. 11, 1943: "The Poor Guy Who Tried to Figure Out How Much One Hundred and Nine Billion Is"

1945 the president submitted the data in Table I showing the growth and changing character of the war program. It may be seen that the entire war period was divided into four phases of which the final one, that of offensive war, had been reached. The striking thing about this analysis, in addition to the tremendous growth in the total outlays for war, was the sharp curtailment in the percentage accounted for by war construction and the growth in both munitions and upkeep of the armed forces. As the size of the armed forces was to reach its peak in the months ahead, the percentage of total war expenditures accounted for by pay and subsistence was expected to reach its maximum in the fiscal year 1945.

The magnitude of the total war program of the United States was brought out by the fact that appropriations, contract authorizations and government corporation commitments from June 1940 through Dec. 1943 totalled $344,000,000,000 and were expected to reach $397,000,000,000 in the course of the fiscal year 1945.

There were some interesting changes shown in the 1945 estimates from those of previous years. Because of the substantial rise in the national debt, the estimate for interest in the fiscal

Table I.—*U.S. War Expenditures Estimate*

Period	Average annual rate (in billions)	Per cent of total: Munitions, including ships	Per cent of total: *Pay, subsistence	Per cent of total: War construction
Preparedness: July 1940–Nov. 1941	$9.8	50	30	20
Defensive war: Dec. 1941–Oct. 1942	45.7	56	22	22

Table II.—*General Budget Summary of the United States*

Classification	Estimated 1945	Estimated 1944	Actual 1943
General and Special Accounts			
Receipts (based on present legislation):			
Direct taxes on individuals	$18,113,100,000	$19,422,600,000	$ 6,952,449,156
Direct taxes on corporations*	15,404,400,000	14,136,900,000	9,915,701,979
Excise taxes	4,251,510,000	4,273,810,000	3,776,956,397
Employment taxes	3,181,600,000	1,881,900,000	1,507,919,214
Customs	438,000,000	420,000,000	324,290,778
Miscellaneous receipts	2,036,770,000	2,442,900,000	907,327,977
Total receipts*	43,425,380,000	42,578,110,000	23,384,645,502
Deduct net appropriation for federal old-age and survivors' insurance trust fund	2,656,380,000	1,392,090,000	1,103,002,793
Net receipts, general and special accounts*	40,769,000,000	41,186,020,000	22,281,642,709
Expenditures:			
War activities (tentative estimate for 1945) (see also government corporations below)	88,200,000,000	88,500,000,000	72,108,862,204
Interest on the public debt	3,750,000,000	2,650,000,000	1,808,100,395
Other activities:			
Legislative establishment	29,540,800	28,756,500	26,694,653
The Judiciary	14,157,000	12,233,000	12,020,150
Executive office of the president	3,406,100	2,244,100	2,572,740
Civil departments and agencies	1,084,424,500	1,086,237,900	812,437,030
Post office deficiency		12,077,695	8,611,843
District of Columbia (Federal contribution)	6,000,000	6,000,000	6,000,000
General public works program	343,401,000	457,477,400	522,524,920
Veterans' pensions and benefits	1,252,179,000	805,389,000	599,777,891
Aids to agriculture	468,254,000	752,017,000	1,037,231,190
Aids to youth		20,000	17,014,849
Social security program	484,965,000	479,780,000	497,511,233
Work relief	2,325,000	43,273,700	317,385,759
Refunds	1,790,122,000	411,459,000	79,137,050
Retirement funds	471,663,500	473,957,600	322,041,800
Expenditures from anticipated supplemental appropriations	45,000,000	170,000,000	
Total, other activities	6,004,236,900	5,801,028,895	4,261,862,641
Total expenditures, general and special accounts, excluding statutory public debt retirement	97,954,236,900	95,951,028,895	78,178,885,240
Statutory public debt retirement			3,463,400
Total expenditures, general and special accounts	97,954,236,900	95,951,028,895	78,182,348,640
Excess of expenditures, general and special accounts	57,185,236,900	54,765,008,895	55,900,705,931
Checking Accounts of Government Corporations and Credit Agencies, etc., with the Treasurer of the United States			
Net expenditures from checking accounts:			
War activities	1,800,000,000	3,500,000,000	2,075,711,475
Other activities	15,000,000	**175,000,000	**1,475,772,073
Net expenditures from checking accounts, excluding redemption of obligations in the market	1,815,000,000	3,325,000,000	1,499,938,802
Redemption of obligations in the market (net)	1,346,000,000	2,770,000,000	693,746,663
Net expenditures, checking accounts of government corporations and credit agencies, etc.	3,161,000,000	6,095,000,000	2,193,685,465
Effect of Operations on the Public Debt			
Public debt at beginning of year	197,600,000,000	136,696,090,330	72,422,445,116
Increase in public debt during year:			
General and special accounts, excess of expenditures over receipts	57,185,236,900	54,765,008,895	55,900,705,931
Checking accounts of govt. corporations and credit agencies, etc., net expenditures	3,161,000,000	6,095,000,000	2,193,685,465
Trust accounts, excess of receipts over expenditures	−46,790,697	−2,121,340	−332,701,494
Statutory public debt retirement			−3,463,400
Adjustment for increase in treasury cash balance	100,553,797	46,022,115	6,515,418,710
Increase in public debt during year	60,400,000,000	60,903,909,670	64,273,645,213
Public debt at end of year	258,000,000,000	197,600,000,000	136,696,090,329

Expenditures shown in the above table are those made through the treasury. In addition, net expenditures through government corporations are estimated in the budget as follows: 1945, $1,815,000,000; 1944, $3,325,000,000; 1943, $1,499,938,802. Grand total treasury and government corporation expenditures: 1945, $99,769,236,900; 1944, $99,276,028,895; 1943, $79,682,287,422.

*Includes the following estimated amounts for excess profits taxes refundable in the postwar period: 1945, $624,000,000; 1944, $545,000,000, and 1943, $220,000.

**Excess of credits, deduct.

year 1945 was placed at $3,750,000,000 as against $2,650,000,000 in the fiscal year 1944. Average interest rates were less than 2% and interest received from all new government issues was fully taxable. As a result the net cost per dollar borrowed after Pearl Harbor was about one-third the cost of borrowings in World War I. The president anticipated gross interest payments of $5,000,000,000 annually on the debt as it would be at the end of the fiscal year 1945. He thought, however, that with a national income of $125,000,000,000 or more, that these payments need not prove oppressive and that by appropriate tax and other economic policies the payment of interest and the gradual repayment of principal during years of prosperity could be achieved without impairing the stability and growth of the national income.

The other major increase among the government expenditures was that anticipated for veterans' pensions and benefits. In addition to existing provisions of law, however, the president recommended a broad program to assist service men and women, meeting some of the problems they will face when discharged. His program included mustering-out pay and an educational and training program for those demobilized from the armed forces.

All of the items of expenditure which were to show a decline from the fiscal year 1944 to the fiscal year 1945 were those which had grown during the preceding years of economic depression. The largest cut suggested by the president was in aids to agriculture where the proposed expenditure for the fiscal year 1945 was almost $285,000,000 under that of the previous year. The decrease resulted largely from the omission of a recommendation for parity payments in agriculture and a reduction in the recommended appropriation for conservation and use of agricultural land resources. All in all, the total of government nonwar expenditures, excluding interest on the public debt, expenditures for veterans and provisions for tax refunds required by law, was expected to continue to decline as it had since 1939. It was expected that these items would amount to $2,953,000,000, a reduction of $571,000,000 below the figure for the fiscal year 1944.

On the receipts side of the budget little change was anticipated for 1945 from the estimates for 1944. Net receipts under legislation existing at the time the budget was submitted were estimated at $41,000,000,000 for the fiscal year 1944 and a little less than that figure for the fiscal year 1945. As compared with actual receipts in 1943 there was a substantial increase of $19,000,000,000 due to the Revenue act of 1942, the Current Tax Payment act of 1943, and the higher level of income and profits. While taxes on corporations were expected to yield somewhat higher revenues, taxes on individuals would decline because the receipts coincident with the transition to a current basis of individual income taxes were nonrecurrent.

With the volume of expenditures recommended at $100,000,000,000 and receipts from existing tax legislation estimated at $41,000,000,000, a deficit of $59,000,000,000 for the fiscal year 1945 was anticipated. This was virtually the same as the deficit for the fiscal year 1944. A deficit of this magnitude in the two years would raise the public debt to $197,600,000,000 by June 1944 and to $258,000,000,000 a year later.

In view of these prospective deficits the president again recommended the enactment of additional fiscal legislation. On the one

Table III.—Government Receipts and Expenditures—Great Britain

(£'000)

Receipts	Actual Receipts 1942-43	Estimate for 1943-44
Inland Revenue:		
Income tax	1,006,828	1,175,000

*Including supplementaries

fiscal year 1943–44 differed but little from the scale of expenditures and receipts attained in the previous year. Expenditures of the magnitude of £5,756,000,000 were proposed for the fiscal year 1943–44, little more than £100,000,000 above the total for the preceding year. Increases in expenditures for interest on the national debt and the prosecution of the war made up the bulk of the rise.

In his budget message the chancellor of the exchequer, Sir Kingsley Wood, stated that it was the objective of the government to limit the draft on capital to the same size as that of the fiscal year 1942–43. Accordingly, it was proposed that revenues be increased by roughly the same amount as the increase in expenditures, making total revenues amount to £2,907,500,000 for the fiscal year 1943–44. By way of emphasizing the financial burden on the British public, the chancellor pointed out that of the expenditures requiring domestic financing, more than 56% would be covered by current revenues.

The bulk of the new revenues were to be obtained by increasing taxes on beer and tobacco, although increases in the rates on other alcoholic beverages, entertainment and telephone services were also recommended. In addition the purchase tax on luxuries was to be increased from 66⅔% to 100%, this increase coming on top of the doubling of the rate in the fiscal year 1942–43. Although the yield in this instance was not expected to be large, it was considered a desirable method of discouraging spending and the consequent utilization of manpower and materials. In the case of income and excess profits taxes which had already risen to very high levels, only minor changes in the interest of equity were recommended.

As in previous years, Sir Kingsley Wood used the budget message not only to review the purely fiscal situation of the government but to outline the status of the broader economic problem of war finance. He stressed the importance of lend-lease aid from both the United States and Canada and also pointed out that British reciprocal lend-lease aid had grown to large proportions. In two matters which had been made essential features of British wartime financial policy, a low level of interest rates and the avoidance of inflation, it was pointed out that a high measure of success had been achieved. Whereas the cost of living index rose only 28% between Sept. 1939 and March 1943, the advance during a comparable period in World War I had been 90%. (M. Gt.)

hand, he urged the congress to retain the increase in social security rates tha were scheduled to become effective on March 1, 1944. On the other hand, he emphasized his support of the administration's revenue program calling for additional wartime taxes of $10,500,000,000. The president emphasized the fact that all the estimates presented in the budget were intimately related to the price stabilization program and that if general increases in wages, farm prices and profits were allowed federal expenditures would increase correspondingly. He therefore urged support for the stabilization program and retention of the legislation allowing renegotiation of war contracts for the purpose of preventing profiteering.

Besides covering possible contingencies associated with continuance of the war for the fiscal year 1945, the budget message discussed various problems of demobilization which were already arising and which would be intensified in the year ahead. The major problems of this character outlined in the budget message were those of contract termination, disposition of surplus property, industrial reconversion, manpower demobilization and reemployment, and veterans' legislation. In these fields the president stressed the need for the establishment of comprehensive and integrated policies as well as the need for guarding against any weakening of the administrative agencies established for carrying out these functions. As to reconversion policy in general the major aim of the government was stated to be the stimulation of private investment and employment. It was thought, however, that there would be urgent need for certain public works in the postwar period in connection with which careful planning was urged to assure priority for the projects of greatest need and for their timing in accordance with the requirements of the employment situation. In addition, the president recommended the broadening of the social security program as a fundamental means of easing the transition from a war to a peacetime economy. It was contemplated that this broadening of the program would include members of the armed forces as well as those employed in industry. (*See* also NATIONAL DEBT; NATIONAL INCOME AND NATIONAL PRODUCT; TAXATION; UNITED STATES.)

Great Britain.—Inasmuch as Great Britain reached virtually a full-war footing in the fiscal year 1942–43, the budget for the

Building and Construction Industry.

Construction in 1943 in the U.S. was confined to war needs—factories and camps, farm service buildings, homes for workers in war industries and military encampments. The tooling-up period had reached its peak by the end of 1942. Therefore, the volume of the building industry declined from $8,849,000,000 of work completed in the first eight months of 1942 to $5,826,000,000 in the same period of 1943.

The year was marked by experimentation with new methods of

New Construction Activity, Continental United States, Eight Months, 1943
(Millions of dollars)

Item	8 months		Percent change

construction, new materials, new ways of using old materials. The incentive to experiment was provided by: (1) the necessity of saving metal, lumber and certain plastics for the materials of war; (2) the importance of speed and quantity production; (3) the need to use a minimum of manpower and (4) the knowledge that a large postwar market would be attainable if the cost of production could be reduced.

The feasibility of prefabricating homes was a subject of considerable study. The term "prefabrication" was used loosely to cover three dissimilar processes, each using a different percentage of factory technique. The three methods included: (1) the fabrication of a complete house within a factory and the shipment of the entire house in large sections by rail, water or truck to various parts of the country, to be assembled at its destination; (2) the fabrication of parts of a house such as the kitchen, or bathroom, or the doors with fittings and frame, to be shipped to builders who have homes of their own specifications under construction; (3) the fabrication of a great many units at the building site by setting up a factory-like assembly line system.

Automobile methods of finance were advocated by some for the postwar building industry. Terms, such as "trade-in-house" were used without definition of the manner in which the trade could be effected. There was a deep conviction that it was desirable to reach the large potential market of people earning less than $2,000, not reached by new construction or rehabilitated old construction before the war. The buying and renting capacity of this income level spurred materials producers, architects and builders to predict the possibility of houses to sell as low as $1,000. However, blueprints did not specify the equipment of the house or reflect the cost of land and taxes upon the total cost of the house.

Because all building costing more than $6,000 per dwelling unit was stopped during the war, it was estimated that there would be a demand market in the future $6,000 to $10,000 home. Two pieces of legislation, the Wagner bill sponsored by the Urban Land institute and the Thomas bill sponsored by the National Planning association were dropped into the congressional hopper. Both bills would authorize the aid of federal funds to cities to buy up slum areas and redevelop them through private enterprise. They were widely discussed by technical groups throughout the country but achieved no popular or congressional attention.

Great Britain.—Conditions in the industry remained fluid and work was spread over programs of national importance in the provinces and repair of war damaged property in the towns. New work was begun on some 3,000 cottages on a thousand sites, scattered over 38 rural districts.

The government announced its acceptance of the Scott and Uthwatt reports in principle, but its recommendations were still awaited. In anticipation of favourable decisions the minister of health approached local authorities with a request that they should, with other authorities concerned, secure a sufficiency of suitable sites for a one-year housing program and begin surveying and preparing the general lay-out.

Great interest was aroused in the government White Paper on training for the building industry. It sought to show that to attract the right type of people to this great industry some measure of security is essential and recommended the avoidance of casual labour, the guaranteed week and that the intake of labour at all stages be scaled nationally on expectation of work ahead. It proposed that the industry be built up to a ceiling of 1,250,000 workers (500,000 craftsmen) after the war for employment on a program estimated to last for 12 years. Half of the work outlined was for housing. Between 3,500,000 and 4,000,000 houses would be required.

After World War I, it took some 7 years to reach a production of 200,000 houses. To step up production, therefore, greater output per man-hour was expected to be required. It was estimated that prewar costs were made up of 60% material and 40% labour and that housing costs had gone up in 1943 approximately by 105% over prewar costs. This steep rise would seriously impede the industry and the question of economies would need to be thoroughly explored. If these were not to be secured at the expense of the operatives they would have to come from more efficient use of labour and material, through improved organization, standardization and prefabrication of building components, new methods, new materials and the thorough revision of local by-laws. (*See* also BUSINESS REVIEW; HOUSING; UNITED STATES.) (N. KE.)

Bulgaria. A kingdom in the Balkan peninsula. Area (end of 1940) *c.* 42,796 sq.mi.; pop. (est. 1942) 8,700,000. Capital: Sofia. Chief cities: Sofia (est. 1942, 401,000), Plovdiv or Philippopolis (99,883), Varna (69,944), Russé or Ruschuk (49,447), Burgas (36,230), Plevna (31,520). Religion: mainly Greek Orthodox; about 1,000,000 Moslems; 50,000 Jews. King: Simeon II; premier (end of 1943) Dobri Boshiloff.

History.—Bulgaria's history in 1943 consisted of a long line of internal troubles, culminating in the death of the king. In 1941 Bulgaria had aligned itself fully on the side of the axis powers, and as a result of the alliance it occupied and annexed Greek Macedonia and western Thrace, and from Yugoslavia southern Serbia, territories of about 23,166 sq.mi., with about 3,000,000 inhabitants. Bulgaria continued in 1943 under a fascist royal dictatorship whose head was the king himself who ruled through puppet ministers of his own choice. The Bulgarian government participated in the war against Great Britain and the United States, yet the strong pro-Russian sympathies of the Bulgarian people and the pro-communist tendencies of the peasantry made it impossible for the government, in spite of strong German pressure, to participate in the war against the soviet union. Bulgaria and soviet Russia maintained diplomatic relations throughout 1942 and 1943.

On the whole, the Bulgarian government followed the nazi line in its domestic and foreign policies. Bulgarian anti-Semitism was as thorough, ruthless and barbaric as that practised in Germany and in other German satellites. There were many complaints from Greeks and Serbs in the newly annexed territories about the harshness and cruelty of Bulgarian rule. The pro-nazi Peter Gabrovsky was minister of the interior.

There was more and better organized protest against the policy of the government in Bulgaria than in any other German satellite country. Repeatedly in 1943 reports of open revolts of peasants, workers and students in many Bulgarian towns penetrated to the outside world.

At the end of March King Boris of Bulgaria visited Chancellor Hitler at his field headquarters. They tried to arrive at an even closer collaboration between the two countries. The king's return to Bulgaria provoked a crisis, for the Russian successes on the eastern front had strengthened the pro-Russian and anti-German sentiment of the people. The king found himself forced to assume *de facto* charge of foreign affairs, while Bogdan Philoff became under secretary of foreign affairs. In many of the larger towns a state of siege was proclaimed. But all these measures did not bring internal peace. Especially violent demonstrations were held throughout Bulgaria, in spite of many preventive arrests, on May 1, and Boris had to leave the capital in haste on the advice of his government. The unrest in Bulgaria frequently took the form of the assassination of prominent pro-axis personalities. Among them was Col. Athanas Panteff, former Bulgarian chief of police, whose national funeral services held on May 4 were followed by widespread rioting with a heavy death toll. Other prominent victims of Bulgarian patriots' terrorism were Sotir Janeff, a close personal friend of the king, president of the foreign affairs commission of the Bulgarian parliament and editor of the semiofficial *Slovo*, and Gen. Christo Lukoff, a former minister of war, both fervent friends of Germany and extreme Bulgarian nationalists. These assassinations were followed by that of Sapria Klevkoff, a member of parliament and, as it was reported, the 110th Bulgarian political supporter of Germany to die at the hands of terrorists.

King Boris III died on Aug. 28 in Sofia after four days of suffering of unexplained origin but which was reliably reported to have been caused by a shooting at a small railway station outside the capital, when the king was returning from a visit to Chancellor Hitler. His six-year-old son Prince Simeon of Tirnovo ascended the throne under the name of Simeon II. It was generally believed that Hitler had put before the king two urgent demands, one for full powers for the gestapo to repress Bulgarian unrest and the other for fuller Bulgarian participation in the war. After the death of the king a regency council was appointed, consisting of Prince Cyril, Premier Philoff and Minister of War Gen. Nikola Michoff. The Bulgarian army, irrevocably committed to a pro-German policy, backed the continuation of a very determined pro-nazi policy in which Minister of the Interior Peter Gabrovsky was the strong man.

The unrest in Bulgaria in 1943 was increased by an expected Allied invasion of the Balkans. On Nov. 14 medium bombers of the 12th United States air force based in Italy bombed railway yards at Sofia, the first time that any target in Bulgaria had been bombed. Further attacks followed, among them on Dec. 10 a raid on Sofia which caused great destruction and killed many persons. The closer alliance of Turkey with the United Nations as expressed in the conference of Cairo on Dec. 5 and the growing strength of the pro-Russian partisan movement in Yugoslavia also caused concern.

Education.—Though elementary education is obligatory and free for children between the ages of 7 and 14, the census of 1934 showed 20.4% of the males and 42.8% of the females illiterate. In 1939 there were in Bulgaria 252 kindergartens, 4,743 elementary schools, 1,932 junior high schools and 112 senior high schools with 969,599 pupils. The university of Sofia had an enrolment of 4,377 men and 1,653 women.

Finance.—The revenue for 1941 was estimated at 10,160,000,000 and the expenditure at 10,096,000,000 leva. On June 30, 1940, the total foreign debt amounted to 12,483,000,000 leva, the internal debt to 11,767,000,000 leva, of which 9,237,000,000 leva was not consolidated. The monetary unit is the lev, stabilized at 92 leva to one gram of fine gold (equal to .95 cent U.S. at the end of 1941). The note circulation on June 30, 1941 was 8,861,000,000 leva.

Trade and Communication.—Imports amounted in 1941 to 10,239,000,000 leva, most of which came from Germany, with Italy second. Exports for 1941 amounted to 9,215,000,000 leva, of which the largest part went to Germany. In 1939 machinery and war material, metal goods, textiles, vehicles and mineral oils were chiefly imported, and tobacco, fruit, eggs, wheat and hides exported. Bulgaria, though it has important ports at the Black sea and on the Danube, had in June 1939 a merchant

FUNERAL PROCESSION of King Boris III at Sofia, Bulgaria, Sept. 5, 1943

marine of only 14 ships of 17,476 tons. At the same time it had 2,211 mi. of railroad, 608 post offices, 798 telegraph offices and 772 telephone exchanges.

Agriculture and Mineral Production.—More than 80% of the population was engaged in agriculture in 1943. Fruit growing and the growing of tobacco and silkworm cocoons are highly developed. The chief crops are wheat, maize, barley, rye and oats. The country is poor in minerals, but rich in coal, yet industrial development has been very slow. (H. Ko.)

Bumpus, Hermon Carey (1862–1943), U.S. educator, was born May 5 at Buckfield, Me. A graduate of Brown university in 1884, he received his doctorate from Clark university in 1891. He taught zoology at Olivet college and at Clark and Brown universities. While a director of the American Museum of Natural History in New York city, 1902–11, he encountered constant friction with the trustees because of his insistence upon popularizing the various exhibits. After leaving the museum, he became business manager of Wisconsin university and was president of Tufts college, 1914–19. Dr. Bumpus was a member of the pure science faculty at Columbia, 1905–11, consulting director of the Buffalo Museum of Science, 1925–30, chairman of the committee on museums in national parks and chairman of the advisory board of the national park service, 1936–40. He died in Pasadena, Calif., June 21.

Bureau of Standards, National: *see* STANDARDS, NATIONAL BUREAU OF.

Burma. A British province lying on the eastern side of the Bay of Bengal, between India and Thailand; occupied by Japan in 1942. Area 261,610 sq.mi.; pop. (1941) 16,823, 798. Chief cities: Rangoon (cap. 501,219); Mandalay (est. 150,000); Moulmein (70,000). Religion: Buddhist (85%); governor: the Rt. Hon. Sir Reginald Dorman-Smith; ministerial adviser: the Hon. Sir Paw Tun; languages: Burmese and English.

History.—Japan set out to consolidate herself politically in Burma during 1943. All radio sets were called in for conversion to medium wave-length in order to prevent the Burmese owners from listening to British and U.S. propaganda. Schools were reorganized to inculcate the Greater East Asia spirit. The Japanese tried to win support with the slogan "Asia for the Asiatics." Books for instruction in the Japanese language were published in Burmese. Burmese students were sent to Japan on scholarships awarded by the Japanese government. A Japanese company published in Burmese a weekly pictorial edition of a Japanese newspaper.

• In March Premier Hideki Tojo conferred with Dr. Ba Maw in Tokyo and declared that "Japan desired the creation of an independent Burmese state." In August the Japanese announced the abolition of their military administration. Dr. Ba Maw, as head of the Japanese-sponsored Burmese government, with the title of Adipadi, formally declared war on Britain and the U.S.A. and signed a treaty of alliance with Japan.

In September Tokyo announced the signing of a treaty between Japan and Burma, incorporating into Burma Karenni, the Wa states and the Shan states, with the exception of Keng-tung and Mong-pan, which were incorporated into Thailand.

To be in readiness for the re-entry of the Allies into Burma, the governor, Sir Reginald Dorman-Smith, and his reconstruction department were building up an efficient civil affairs service to go back with the army and were working out plans for the physical reconstruction of Burma and for its future administration.

Education.—In 1940, total number of institutions 27,015, scholars 851,922; primary schools 5,679, scholars 384,060; middle 1,018, scholars 139,190; high 399, scholars 94,353; special 1,172, scholars 19,190; unrecognized institutions 18,745, scholars 212,663; university (Rangoon) 2,365 students; arts college (Mandalay) 101.

GEN. JUICHI TERAUCHI (in helmet), Japanese conqueror of Burma, paid a shoeless visit to the Dragon pagoda in Rangoon in 1943, accompanied by Dr. Ba Maw, Japan's native puppet (extreme left, barefooted). The picture was released through Portugal

Finance.—Revenue (est. 1941–42) Rs.17 crores 13 lakhs; expenditure (est. 1941–42) 18 crores 28 lakhs; public debt, (March 31, 1940) Rs.51 crores 22 lakhs; exchange rate: rupee (Rs.1) = 1*s.* 6*d.* One crore = 10,000,000 rupees; one lakh = 100,000 rupees.

Trade and Communication.—Overseas trade in merchandise (April-March 1940–41): imports Rs.29 crores 55 lakhs; exports, including re-exports Rs.55 crores 38 lakhs. Communication, 1940: roads suitable for motor traffic, all weather, 6,811 mi.; seasonal 5,661 mi.; railways open to traffic 2,060 mi.; inland waterways (approx.) 1,300 mi.

Agriculture.—Production (1940–41): rice 6,000,000 tons; groundnuts 160,000 tons; sesamum seed 72,000 tons; cotton 13,000 tons of lint; tobacco 106,869,600 lb.; teak 438,827 tons.

Mineral Production.—In 1939, petroleum 275,673,364 gal.; tin concentrates 5,441 tons; tungsten concentrates 4,342 tons; tin tungsten concentrates 5,593 tons; refined lead 76,000; antimonial lead 1,180 tons; zinc concentrates 59,347 tons; copper matte 7,935 tons; nickel speiss 2,896 tons; silver 6,175,000 troy oz.; gold 1,206 troy oz. (Ton = 2,240 lb.) (*See* also JAPAN; WORLD WAR II.) (H. L.)

Business Review. **Business and War.**—The U.S. department of commerce estimated that 70% of the total output of American industry for 1943 was produced for war purposes. This figure afforded a reasonably accurate

measure of the extent to which business and industry were working for the government. Although federal monthly expenditure reached its peak in June with a total of $8,300,000,000, the peak of war production was not reached until October. The War Production Board, taking the pre-Pearl Harbor month of Nov. 1941 as a base of 100, announced that in Nov. 1943 the index had risen to 648—6½ times the maximum for prewar months. By the end of the year the board announced that four production bottlenecks remained—landing .craft, trucks, electronics and heavy-duty tires. On Oct. 29, the navy cancelled contracts for 427 anti-submarine vessels, the largest single contract termination for the year, thereby substantially relieving pressure on basic war industries, and indirectly announcing the success of the antisubmarine campaign. In November the government began searching for buyers under the war surplus disposal plan. Thus the year 1943 marked the turning point in war production. (*See* also WAR PRODUCTION, U.S.)

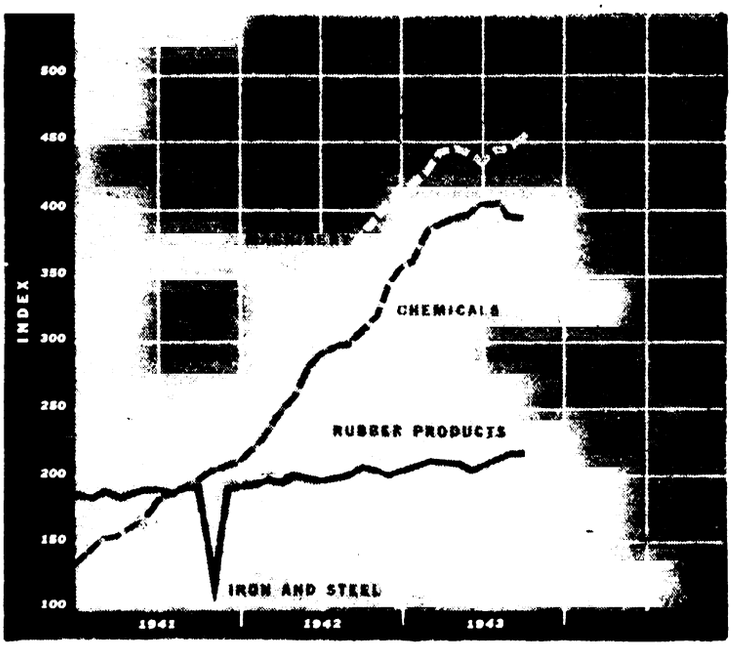
Aircraft Industry.—The U.S. aircraft industry became the largest single manufacturing industry in the world, measured in terms of number of employees and size of pay rolls. For 1943, the value of products totalled $20,000,000,000, wages amounted to $2,700,000,000, with more than 1,000,000 workers employed. The total value of annual output for 1943 was more than 70 times greater than that of 1939, while pay rolls were 20 times greater. Notwithstanding this development, the industry failed to live up to expectations. On Jan. 2, 1943, the War Production board had set the 1943 goal at "about twice the number and about four times the weight of planes built in 1942." During the year plane production, all types, increased from 16,600 in the first quarter to 20,400 in the second quarter, rose to 22,500 in the third quarter and, at the October production rate, to 25,000 in the last quarter. A new record of heavy-bomber production was established in October after it had become clear that bomber production for heavy long distance attack was demanded on both the European and Pacific fronts. (*See* also AIR FORCES.)

Automotive Industry.—The automotive industry began the year with over $14,000,000,000 in unfilled orders. Aircraft products accounted for about 50%. The remaining half of the total backlog was broken down roughly as follows: military vehicles, covering about 60 different types, 20%; tanks and parts 15%; ammunition, artillery and small arms 9%; and other products 6%. The disclosure of the exact quantity of specific output was prohibited by the government as "information that would give aid and comfort to the enemy." The industry was able to reveal, however, that the unfilled orders in Nov. 1943 had exceeded those in January. By July the actual shipments surpassed those for the entire year 1942, and by mid-September the annual rate of production had mounted to $9,500,000,000. (*See* also AUTOMOBILE INDUSTRY IN THE WAR.)

VOLUME OF MANUFACTURE of U.S. durable and nondurable goods, 1941–43, as estimated in The Federal Reserve *Bulletin* (1935–39=100)

Shipbuilding.—For three war years after 1939 the German submarines had been sinking tonnage faster than replacements could be made by the yards of the United Nations. The peak of the submarine wolf-pack tactics was reached in March 1943, but by midsummer the number of sinkings had grown negligible, while the destruction of submarines had expanded significantly and precision bombing of German submarine bases and factories had gained in frequency and intensity. Shipping losses by Oct. 1943 subsided to the second lowest of any month during the war.

The U.S. Maritime commission began the construction of Liberty cargo ships in 1941. These vessels were designed for mass construction by subcontracting, subassembly, and prefabrication of hull and equipment. By Oct. 1943, 11 yards had delivered about 1,500 such vessels. Exceeding by 3,000,000 tons the original annual goal set by WPB, these shipyards had launched about 19,000,000 dead-weight tons by Dec. 1943.



By 1943 shipbuilding yards had become the chief customers of the steel industry, taking substantially more than the 16% of total steel shipments. Growing steadily, not only on both coasts but on the Great Lakes, shipbuilding became another billion-dollar industry. Perhaps the outstanding achievement of 1943 was the construction of tankers which not only relieved the oil shortage in the east with increased coastwise traffic, but also met the need for "oceans of oil" on the European and Pacific fronts. (*See* also SHIPBUILDING.)

Steel Industry.—Since steel had become the industrial giant that supplied the bone and sinew of mechanized warfare, that industry operated almost exclusively under the direction of the War Production board in 1943. WPB warned in April 1943 that the industry had not met its quota, in May the War Manpower commission demanded a 48-hr. week for steel workers, but in June a 26% deficiency still existed. The industry blamed the coal shortage, resulting from strikes by the United Mine Workers, for the closing of blast and open hearth furnaces. The first half of 1943 ended with a 43,800,000-ton production but in the second half, all-time monthly production records began to be broken in September, increased in October and November, operating in excess of 100% theoretical capacity—but by December open hearth production dropped for want of unfilled orders and because of labour unrest. The drop in lend-lease requirements, the contract cancellations of the war and navy departments with

PHYSICAL PRODUCTION in leading U.S. war industries, 1941–43; Federal Reserve estimate corrected for seasonal variation (1935–39=100)

munitions plants and the increasing stock piles at mills allayed fears of inadequate output. (*See* also IRON AND STEEL.)

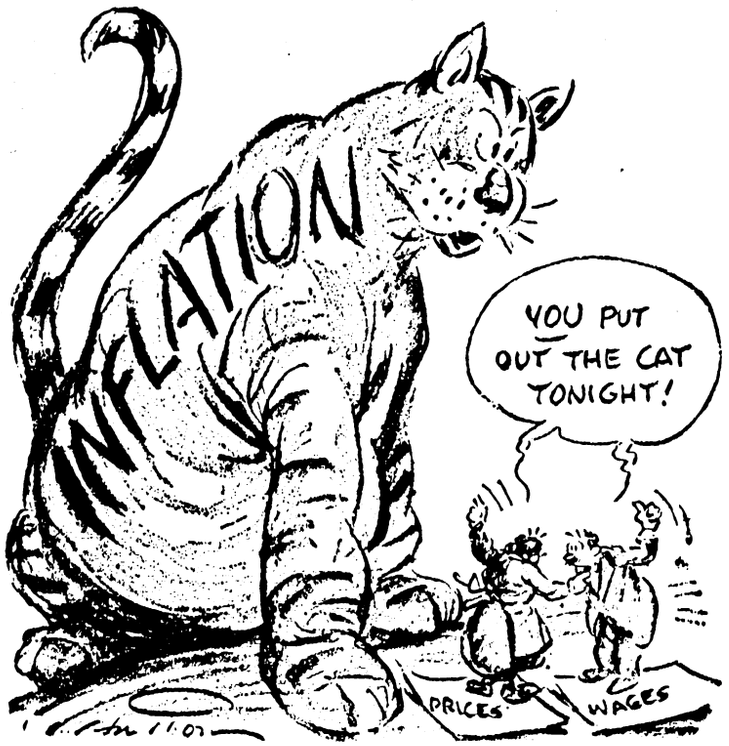
Critical Metals.—Strategic metals, including copper, lead, zinc, aluminum, magnesium, cobalt, molybdenum, vanadium, nickel and chrome, which WPB classified as "super-critical" in Aug. 1943 were available in ample supply for both direct and indirect war needs by December. Exact production figures were not available, but industrial sources reported that hundreds of millions of dollars worth of surplus metals were in federal and industrial stock piles. The sudden change in the fourth quarter from shortage to surplus was caused chiefly by the reduction of the armament program. Copper producers reported refined copper stock alone at around 400,000 tons, and some copper processors sought the consent of the Office of Civilian Supply to divert production to electric power companies, communication facilities and construction companies. (*See* also COPPER.)

Producers of aluminum (*q.v.*), like those of copper, had won the battle of production in 1943. Aluminum scrap, collected in nation-wide drives in 1942, had become a drug on the market, and by November processors began selling below ceiling prices, while high-cost producers sought subsidies to prevent shutdowns. Stock piles of primary aluminum—that made from bauxite ores, compared with secondary aluminum made from scrap—were estimated at 70,000,000 lb. at the close of 1943. In the autumn the government abandoned its plan to erect three aluminum-magnesium extrusion mills. During 1943 the astonishing increase in aluminum output, in the United States alone, turned the scales definitely in favour of Allied war plane production.

Production of magnesium (*q.v.*) for 1943 soared to around 500,000,000 lb., sufficient for all known military purposes. The year-end stock pile had fallen to 25,000,000 lb. despite earlier expectations of a larger supply, because the aircraft demand for this metal had grown abruptly with a better knowledge of the relative merits of magnesium and aluminum. The heaviest magnesium consumer, using about 60% of the total output, was the Chemical Warfare service.

Lead (*q.v.*) was the first metal to be removed from the critical list by WPB. The armed services had ordered a decrease in small arms ammunition production, but almost immediately the released lead was absorbed by batteries, cables and ethyl gasoline. The year 1943 ended with stock piles of the Metal Reserve corporation of the government holding over 200,000 tons as a contingency against future emergencies.

Despite the wide use of tungsten (*q.v.*) in cutting tools, dies, drills, wires and electric light bulbs, Dec. 1943 found the producers of this metal with an almost normal supply on hand. About 60% had been imported from China and Latin America and 40% obtained from the mines scattered throughout Nevada, California, Idaho and Colorado. Marginal mines began to close down. Other hard-metals producers of molybdenum and vanadium had fulfilled production quotas and the ferro-alloy branch of WPB no longer recommended allocation to war production only. (*See* also STRATEGIC MINERAL SUPPLIES.)



Rubber.—One of the most crucial and unsolved production problems of 1943 was the development of the synthetic rubber industry. The third report of the Rubber director in 1943 placed the total existing supply at 751,000 tons, including 443,000 long tons of crude product, 275,000 long tons of synthetics, imports of 40,000 tons from South America and about 14,000 tons from Liberia with small shipments from Ceylon. Synthetic production was divided as follows: buna-S, 218,000 tons; buna-N, 17,000 tons; butyl, 11,000 tons; neoprene, 29,000 tons; and a negligible supply from thiokol. Dollar volume for the industry was well above that of 1942 primarily because OPA had allowed higher price ceilings on rubber goods sold to the government. (*See* also RUBBER.)

Oil and Gasoline.—The bureau of mines estimated motor fuel demands in the first quarter of 1943 at 18% below that for the same period of 1942, and the total oil demand at 9% less. By June, gasoline consumption had diminished 1% below the preceding year, and at the close of the third quarter the production of motor fuel, distillate fuel oil, residual fuel oil, kerosene and lubricants, plus changes in inventories, had increased reserves above the 1942 level by about 2%. Decreases in motor fuel use of 6% for the first three quarters were more than offset by the 8% increase in distillate and 11% increase in residual fuel oils. The bottleneck problem for the oil industry in 1943, like that in 1942, remained one of transportation despite heavier gas rations. (*See* also PETROLEUM; RATIONING.)

Railroad Transportation.—The U.S. railroads confronted the paradoxical situation of seeming to limit their own business by reducing civilian passenger travel. The explanation lay solely in troop movements. During the first 19 months of U.S. participation in the war, the railroads transported 21,754,305 soldiers (an average of more than 100,000 per day) in organized movements, compared with the 8,874,708 soldiers moved by rail for the entire duration of World War I. Although the strain on freight equipment also had become acute in 1942, the Class I roads carried approximately 15% more revenue ton-miles of traffic in the first ten months of 1943, about 55% more than for 1941 and 123% more than for the same period in 1939. (*See* also RAILROADS.)

Building.—Aggregate construction for 1943 fell below $8,000,000,000, compared with $13,000,000,000 for 1942. According to the department of commerce, private construction fell below $1,600,000,000 and became "one of the most thoroughly deflated of all private businesses."

Construction indexes showed pronounced downward trends throughout the year, for value of building permits, dollar volume construction, number of dwelling units and nonresidential buildings. Two exceptions were shown, first, in the indexes of new residential buildings, which held unvaried throughout the year, and second, in expenditures for "additions, alterations and repairs," which showed a definite upward trend. Despite shortages in material and manpower, the actual dollar volume of 1943 construction exceeded that of the annual average from 1930 to

"THE USUAL FAMILY SQUABBLE," by Hutton of the *Philadelphia Inquirer*

1939. (*See* also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

Company Earnings.—The New York stock exchange survey of 494 listed companies showed that in the first three quarters of 1943, net earnings exceeded those of 1942 by 10%. The largest gain was found in the amusement industry, 48.2%; the largest loss in the building industry, 11%. Automobile makers gained 22.7%, petroleum companies 18.4% and food companies 14.6%. The aggregate return upon the combined capital of 275 leading industrial corporations reached 8.8%, compared with 8.1% in 1942 and 12.3% in 1941. Despite the large volume of business, stockholders did not share proportionately, as a lower margin of profit per sales dollar was obtained by the 73 largest manufacturing corporations whose sales volume had risen 34% above that of 1942. The 275 corporations paid 68% of their net income before taxes to the federal government, and although this proportion appeared abnormally high, it approximated the national average, since the president's annual budget message called for $108,000,000,000 out of a total national income of $145,000,000,000, thus requiring 74% of the national dividend for the federal treasury.

Confronting the uncertainties of a postwar reconversion period, many companies sought to build reserves out of earnings, but the treasury was averse to a policy that might become a refuge for tax avoidance. After allowing a deduction of a 10% credit for postwar refunds on excess profits taxes, the companies set aside reserves for federal income, excess profit and capital stock taxes, as well as certain state and foreign taxes.

Requirements of reconversion reserves varied widely. In the chemical industry peacetime production involved slight reconversion costs, whereas the automotive industry, which had practically abandoned the production of passenger cars for aircraft production, required substantial reconversion reserves. Corporate earnings were held in a state of uncertainty because renegotiation of contracts, hanging like the sword of Damocles, threatened every distribution of earnings. Certain companies that had enjoyed prewar monopolistic advantages suddenly confronted postwar competition from new substitutes, from foreign producers subsidized by their governments and from postwar use of extensive plants erected by the government in wartime. They found it desirable to add to their contingency reserves. Still other corporations, laying postwar plans for the establishment of chain stores and outlets, withheld distribution of wartime earnings.

Retail and Wholesale Trade.—Notwithstanding price ceilings on retail goods, sales volume never fell below $5,000,000,000 per month in 1943, except for the first two months of the year—a showing well above the monthly average of $4,815,000,000 for 1942. Nondurable goods, as usual, took the lion's share of the consumer's dollar. The sales volume of nondurable goods, which customarily exceeded that of durable goods by two- or threefold, rose abruptly to seven- or eightfold. Fear of a shoe shortage struck the February retail market and sent total volume to an all-time peak, and when the second shoe ration stamp became available in June, total sales volume again soared, this time inducing a fear of clothing shortage. Beginning in June apparel inventories began a monthly decline, and when in September apparel sales reached $544,000,000, compared with $414,000,000 in January, the department of commerce considered the possibility of clothes rationing. As consumers' income rose, the proportion spent on women's wear increased, and that for men's wear declined. Table II shows the unmistakable increase in the monthly trends of retail trade sales for 1943.

Retail sales of durable goods continued the decline that had begun in May 1941. The average monthly sales stood at $1,035,000,000 in 1940, rose to $1,303,000,000 in 1941, dropped to $839,000,000 in 1942, and approximated $780,000,000 in 1943. Curtailment was heaviest in building materials, auto parts and accessories, home furnishings, farm implements and hardware. Despite this decline in durable goods sales, the dollar value of all retail sales was 62% higher than the annual average from 1935 to 1939, and since the cost of living had risen but 24%, there was ample evidence that consumers' standards of living were not falling and that, despite the economies of war, total civilian consumption had increased through a draft on increased physical production and inventories.

The curtailment of civilian production of durable goods had led to the belief that total retail inventories would almost disappear, but according to the bureau of foreign and domestic commerce, the Sept. 1943 total actually reached $27,800,000,000, because general merchandise and apparel stores had been able to add to their supplies of nondurable goods. While at no time did total inventories during 1943 attain the 1942 levels, they did approximate those for 1941.

Although about $1,000,000,000 in retail inventories had disappeared over the 12-month period, wholesale inventories maintained a remarkably steady position.

Combined sales of the 14 leading variety chains gained 7.5% over 1942 record sales. By Oct. 1943, when merchandise shortages had been predicted, these stores actually showed gains in sales volume. Sales were 33% greater in September than in

January as consumers began extensive buying of luxury items. Department store sales ran about 60% cash sales, 5% instalment sales and 35% charge accounts. Inventories of these stores increased substantially in August and September, and unusually early holiday sales began in October.

Cost of Living.—The cost of living in 1943 was approximately 6% higher on the average than for 1942, according to estimates of the bureau of labor statistics. Using a different basis for computation, the National Industrial Conference board reported that by Oct. 1943 living costs were only 3.9% higher than for the same month in 1942. With trade union wages based upon the "little steel" formula, it became an important matter which index was used, but the War Labor board adhered to that of the bureau of labor statistics. U.S. earnings hit an all-time peak with a gross income of $103,000,000,000 in the first nine months of the year, and for the country as a whole the September dollar income was 20% higher than for the same month in 1942. The treasury reported in November that Americans were spending at the unprecedented rate of $91,000,000,000 annually, out of a total predicted national income of about $145,000,000,000. Wage earners attributed this increased spending to higher costs of living than were reflected in the indexes used for wage determination.

The department of commerce reported that during the fiscal year 1943, when per capita income payments rose at the most rapid rate since midsummer 1940, the cost of living index had risen only 2% per quarter compared with 3% per quarter in 1942. Largely as the result of price control, rationing and wage

U.S. Department of Commerce.

ceilings, the per capita expenditures of consumers dropped from 86% of income in 1940 to 66% for 1943, while net savings and personal taxes had grown from 14% to 34% of individual income. The disposition of individual incomes, 1940 to 1943, is shown in Table III.

The especially sharp rise in food prices in the first quarter of 1943 was attributed chiefly to an unprecedented rise in the price of fresh fruits and vegetables as the result of a late spring freeze and the lack of ceiling prices. The drop in food prices in June and July was attributed to the tremendous increase in victory gardens and to the roll-back of certain food prices under the regulations of the Office of Price Administration. In July came the first drop in meat prices, and the increased marketing of lambs, cattle and hogs, caused by the high prices of stock feed, further reduced meat prices in the last quarter. Consumers' organizations complained that although prices of canned goods remained fixed, the quality and quantity were lowered and that price control was meaningless without compulsory grade labelling. (*See* also PRICES.)

Clothing prices remained remarkably stable for the year. Throughout the years 1941 and 1942 consumer expenditures for wearing apparel kept in step with the rise of income, but during 1943 consumers spent proportionately much more, and by the fourth quarter, demands for luxury clothing swamped the retail clothing stores, especially in the fur trade. Jewelry and other luxury items, not included in the cost of living budget and not subject to price control, showed abrupt increases in total volume of holiday sales. Table IV shows the trend in the most important items entering into the cost of living.

Table IV.—*Indexes of the U.S. Cost of Living, 1943 (1935–39 = 100)*

Month of 1943	Combined cost of living	Food	Clothing	Housing	Fuel and light	Miscellaneous	Purchasing power of dollar measured by cost of living
January	120.7	133.0	126.0	108.0	107.3	113.2	82.9

Fear that the cost of living could not be controlled was founded both on the rising prices of foodstuffs and on rising wages. Practically all wage adjustments came under the jurisdiction of the War Labor board, and only in exceptional instances were increases allowed above the 15% ceiling fixed by the "little steel" formula, and then chiefly as incentive wages related to increased output. Between May 1942 and July 1943, the cost of living had outdistanced hourly wage rates and was about 24% above the Jan. 1941 base, and collective bargains were for the most part written in terms of hourly wage rates. Management pointed to increases in average hourly earnings, which included bonuses, premiums and other incentive wage payments, showing that these had risen from 68.3 cents in January to 84.5 cents by June 1942 and to 95.9 cents by June 1943, and that concomitantly pay rolls had increased 140% above the 1941 base. Union leaders demanded wage increases because "take-home" pay had decreased, since wages were reduced 20% by the withholding method of collecting the income tax, 10% by reductions for war bonds and by the social security tax, group insurance charges and

check-off for union maintenance; but WLB related living costs to the contractual, not the "take-home," wage. The trend in income payments, wholesale prices, pay rolls, factory employment, purchasing power of the dollar and prices of farm products gave a more exact explanation of the incomes used to defray costs of living. The data in Table V were combined from reports of the bureau of labor statistics, the Federal Reserve board, and the bureau of agricultural economics. Securities.—Yields on all common stocks regularly traded on the New York stock exchange ended 1943 about twice as high as the yields of high grade corporation bonds. Listed industrial securities, according to the Dow-Jones average, rose from 125 in January to 136 in March and April, to 142 in May, levelled off in June and reached the high for the year in July at 146. August saw the market drop to 138, level off through November, and close the year slightly higher. The stock market justified none of the fears of those who had predicted runaway inflation. Approximately the same trends appeared for industrial, rail and public utility shares. The volume of trading for 1943 rose far above any year of the previous decade. New and refunding issues also increased with the latter accounting for three-fourths of the total volume.

In January congressional tolerance proved a bullish factor, and public interest was aroused in low-priced stocks. In March strike threats impaired price controls, forcing the market higher, but this was offset somewhat in April by demands for a 48-hr. week and more vigorous governmental controls. In August the unloading of war stocks turned the market downward. With congressional consideration of the treasury's ten-billion-dollar tax proposal, the market took a bearish turn in October, and congress reacted at once by shearing the tax bill to a two-billion-dollar levy. Except for tax loss sales, the market held its own in December. Following the recommendation of the treasury to use the period of high earnings to retire indebtedness, many industrial, railroad and public utility corporations substantially reduced their outstanding bonds. (*See* also STOCKS AND BONDS.)

Banking.—Money in circulation outside the treasury and the federal reserve banks in Jan. 1943 totalled $15,500,000,000 and exceeded $18,800,000,000 by October. By that time five-sixths of the money in use was in the form of paper currency, with $15,100,000,000 in federal reserve notes. Bank deposits in February reached $54,800,000,000 and soared to $75,700,000,000 by September. In eight months bank deposits had risen about $21,000,000,000, equal to the growth of both bank deposits and currency in circulation in 1942. The Federal Reserve board reported that of a total of $113,000,000,000 in deposits and currency outstanding at the end of August, over $40,000,000,000 belonged to business and $60,000,000,000 to individuals, trust funds and nonprofit organizations, with the remaining $13,000,000,000 held in government accounts.

Excess reserves continued to decline throughout 1943. In Jan. they amounted to $2,300,000,000, and thereafter dropped irregularly until July 28, when they reached a low of $1,000,000,000. The U.S. securities that had stood at 109.8 in January had risen to 113.2 by September, giving substantial evidence that the "full faith and credit" of the federal government had been more than maintained during the year. (*See* also BANKING; NATIONAL DEBT.)

Bankruptcy.—Involuntary bankruptcies fell to a new low for seven years in 1943. For the first half of the year, about 167,000 business firms discontinued business for various reasons, such as shortage of inventory; army draft; difficulty in procuring materials, manpower or equipment; impairment of business profits by price controls and taxes; and disappearance of markets. It is important to distinguish business discontinuances from bankruptcies. According to Dun and Bradstreet 2,753 firms, compared with 7,641 for the year 1942, went bankrupt during the first three quarters of 1943, whereas the Small Business committee of the senate estimated that approximately 300,000 firms discontinued business for the year as a whole.

The drop in total liabilities of bankrupt firms was traceable chiefly to the decline in the number of firms failing. Retail trade failures from January through August 1943 were about one-third the number for the corresponding period of 1942. Declines in bankruptcies were most marked in general merchandise, furniture and automobile lines; the trend for bankruptcies in apparel shops and drug stores reached the average; while the number of monthly failures for hardware stores and restaurants was distinctly higher than the average. With the exception of two—one in steel and another in tool manufacture—all the manufacturing failures involved small scale enterprises. For the first three quarters, the percentage of discontinuances was four times as great for firms employing from one to three persons as for firms employing 50 or more. Both bankruptcies and discontinuances revealed that the smaller firms confronted in wartime greater dangers and business risks than larger firms.

Legislation.—The attitude of congress toward business was more favourable in 1943. In April, congress reduced the tax rate on corporate income recommended by the treasury and refused to raise the excess profits tax above 90%. Corporations were required, however, under the Current Tax Payment act, to investigate the family status, births and deaths of all employees for withholding income for tax purposes, and to estimate in advance payments to be made during the year as bonuses, premiums, commissions, fees and overtime wages. Thus business firms had become more and more, since the imposition of the social security tax, federal tax-collecting agencies. Moreover, wage deductions for war loan bond purchases had become an added governmental function imposed on business. Congress refused to levy the general retail sales tax supported by representatives of business and industry. In Oct. 1943, after the treasury had recommended a tax bill for $10,000,000,000, congress produced a revenue measure providing for about $2,000,000,000, and when the budget bureau's supplemental appropriation bill, usually accepted without any great dissent, was submitted, congress sheared 82% from that bill. Strenuous congressional efforts were made to reduce nonwar waste through reduction in longstanding expenditures. In August, the Office of War Information estimated that the treasury had saved $3,555,000,000 through renegotiation of contracts, and congress refused to make redress for the resulting uncertainty in business. (*See* also TAXATION.)

The administration of laws previously enacted gave rise to extensive management risks, such as the ever-increasing complexity of tax regulations, decisions and rulings; the extension and

enforcement of price and wage controls; termination or partial cancellation of war contracts; alteration of priorities and allocation of producers' goods; and unexpected regulations and post-war plans issued by federal bureaus.

As a result of the attempts of the War Labor board and the Director of Economic Stabilization to prevent wage increases at a time of most acute manpower shortage, industry suffered the loss, through strikes, of 170,000 man-days in Feb. 1943; 230,000 in March; and 675,000 man-days in May. To enforce their rulings, the president, acting under the War Powers act, temporarily took over the coal mines May 1, released them in August, resumed control Oct. 27 and took over the railroads on Dec. 27. Upon order from the president to "hold the line" against inflation on April 8, the War Manpower commission froze 27,000,000 workers to their jobs in government, railroads, farm and industry, to ensure against wage increases and rising costs. Pursuant to rationing powers the number of commodities placed on rationed lists increased considerably, thereby placing more food industries under governmental surveillance. (*See* also LAW.)

Foreign Trade.—For the first time in the history of U.S. foreign trade, monthly exports exceeded $1,000,000,000, beginning in May, and reached a total of $10,278,000,000 for the first ten months. Lend-lease shipments accounted for more than $8,000,000,000, and exports sold for cash, $2,778,000,000. The Office of Lend-Lease administration reported that the distribution through June 30, 1943, had been made as follows: to the United Kingdom, $4,458,000,000; to the U.S.S.R., $2,444,000,000; to Africa and the Middle East $1,363,000,000; to the Far East and Oceania, $1,133,000,000; and to all other countries, $484,000,000; making a total value of $9,882,000,000 from the beginning of the lend-lease program. By far the greatest quantity of such exports was made in 1943 after the "arsenal of democracy" had begun to function. According to British authorities, the dollar value of lend-lease was not statistically accurate, nor ever could be, since "if the United States sends us aircraft for British crews to fly from British airfields, that is recorded as lend-lease. If they send such aircraft complete with American crews who fly from the same field, that is not reckoned as lend-lease." Moreover, the British noted, it was difficult ever to determine with statistical accuracy the difference between the American equipping of British men, and British manning of American equipment, nor could a commercial value be fixed on the pint of British blood plasma poured into American veins, or vice versa.

Export trade of 1943 accounted to no small extent for the nazi reverses on the Russian front. The U.S. exports to the U.S.S.R. were as follows: ordnance and ammunition, $316,000,000; aircraft and equipment, $522,000,000; industrial and naval supplies, $691,000,000; military vehicles and tanks, $372,000,000; and farm products, $416,000,000. According to the British information service, Britain had also exported, as of June 30, another $716,000,000.

Reverse lend-lease announced in the simultaneous reports by the United States and Britain in Nov. 1943 had taken place on an extensive scale during the year. The United Kingdom had rendered services and supplied materials valued at $871,000,000. Australia had supplied food and clothing amounting to $196,000,000; New Zealand had furnished about $51,000,000 in food, and India, $57,000,000; so that the total for reverse lend-lease approximated $1,171,000,000 during the year. According to these figures, American lend-lease exports exceeded imports by almost an eight-to-one ratio.

Table VI gives the exports and imports by months, showing the extent to which both exceeded those of 1942. The National Industrial Conference board differentiated the lend-lease and "cash" exports for the first nine months of the year. The totals differed slightly because re-exports were included, but the preponderance of lend-lease monthly exports was outstanding. (*See* also INTERNATIONAL TRADE.)

U.S. Department of Commerce, *Survey of Current Business.*
*National Industrial Conference Board: *The Record.*

Business Conditions in Other Countries.—*Great Britain.*—The financial structure of Great Britain sturdily withstood the strain of the fourth war year in 1943. The official price system remained remarkably stable. The cost of living index (July 1914 = 100) remained fixed at 165 each month during the first half of 1943, rose to 168 for July and October and continued firm through the last half year. No variation whatsoever occurred in the indexes for rents, fuel, light, iron and steel, nonferrous metals and cotton. Prices rose slightly for chemicals, oil, food and tobacco. The wage index of the London and Cambridge Economic service showed an increase from 139 in January to 143 in June, remaining thereafter at 144 (Dec. 1924 = 100).

War shackles on company earnings and profits were retained in 1943. Net profits for 515 companies dropped 6% below those of 1942, and 25% below prewar levels. The stock price index rose steadily until May, revived somewhat during the summer and levelled off at a lower point in the latter half year. The average rate of ordinary dividends rose from 8.3% to 11.9% between the second and third quarters, thus remaining at the same levels as 1942. Bank notes in circulation rose from £912,000,000 in January to £994,000,000 in October, while public deposits increased from £7,800,000 to £11,100,000. Indexes of gilt-edged securities, fixed interest investments, bank and insurance securities, all showed a steady and conservative tendency to rise throughout 1943. The chief obstacles to increasing physical production were labour shortages and strikes. (*See* also GREAT BRITAIN.)

Canada.—The phenomenal rate of industrial expansion began to abate in 1943. The official index of physical volume of business reached 236% of the 1935–39 average by September, falling below August and April but remaining 14% above the 1942 level. Output gains of 23% were recorded in manufacturing and 26% in mineral products. Production of newsprint and pulp dropped below the 1942 level early in the year, despite a high labour priority. Suspension of trading in wheat futures on the Winnipeg grain exchange in September facilitated national price controls. Since 1942 the controlled price of bread, the key item in the cost of living index to which wage payments were tied, had been preserved by subsidies to bakers covering the difference between flour costs and the market price of wheat, and in 1943 the Wheat board purchased wheat directly to regulate market flow.

More than $1,000,000,000 in mutual aid was given the United Kingdom. Huge wheat exports were sent to the U.S.S.R. on lend-lease accounts and to the United States for cheaper feed supplies for American livestock and dairy industries. These wheat exports substantially relieved the exchange pressure on the Canadian dollar. (*See* also CANADA.)

Germany.—Official statistical data continued unreliable in 1943 because they were issued by and for the propaganda ministry to show "the achievements of the defense year 1943." British estimates of bombing damage to war industries placed losses at 33%, Swedish estimates at 15%. Needle and shoe trade machines were moved out of some factories into homes. Shortages were especially acute in iron and steel, rubber, meats, clothing, shoes and oil despite conscription of millions from occupied territory. Closing of bank branches was extensive in preparation for complete nationalization of banks. The board of economic warfare estimated nazi loot and plunder as equivalent to $10,000,000,000 per year. According to nazi official data, stability dominated all prices, wages, loans, deposits, securities and incomes. In Sept. 1943, German armed forces commandeered all motor vehicles, mules, fuel, lubricants and tools in occupied Italy and conscripted labour for the service of the nazi army and industry. No trustworthy data were available showing the extent to which other occupied countries were impoverished by nazi officials and armies. (*See* also GERMANY.) (E. H. HE.)

Butter. Total butter production in 1943 was estimated by the U.S. department of agriculture to be 2,138,000,000 lb. —about 1% more than was produced in 1942 and 1% below the 1935–39 average. The military and lend-lease needs took such a large share of the total that butter became scarce in many regions early in 1943, even with strict rationing and the production of a large quantity of substitute oleomargarine. The civilian consumption of butter declined steadily in 1943 and was only 13.3 lb. per capita compared to 17 lb. in 1940 and an average of 16.8 lb. for the five-year prewar period 1935–39. This was only 73% of the average while the consumption of margarine was 148% of the prewar period. The shortage of butter for civilians became so acute in October that the government announced that there would be no government buying of butter until April 1944 and that the entire production would be made available for civilian uses. The government requirements were stated to be 316,000,000 lb. for the military and 122,000,000 lb. for lend-lease, relief and other programs.

The goal for total milk production of 122,000,000,000 lb. for 1944 offered little hope for an increase in butter for civilian consumption due to the strong demand for fluid milk. The rationing of butter at 16 points per pound at the end of 1943 sharply reduced consumption in many areas. One important factor in the decline of butter production was the diversion of milk to fluid milk consumption because of the higher consumer buying power in the larger cities. Changes in food habits such as the increased consumption of quick lunches was an important factor.

The stocks of fluid cream in cold storage were very heavy, almost double the normal, and the excess was equivalent to about 9,000,000 lb. of butter. The heavy stocks in cold storage at the end of 1943 were held chiefly by the government to meet its needs until spring when buying for the government account is to be resumed. Consumers did not seem disposed to turn to butter-substitutes even at the high ceiling prices. (*See* also CHEESE; DAIRYING; MILK; OLEOMARGARINE.) (J. C. MS.)

Byrnes, James F. (1879–), U.S. official, was born May 2 in Charleston, S.C., of Irish parentage. At the age of 14 he left school to become office boy of a law firm. By studying stenography, he advanced to the position of court reporter. In 1910, he was elected to the house of representatives on the Democratic ticket and was re-elected six times, serving from 1911 to 1925. As a member of the deficiency committee during World War I, he formed a lasting friendship with Franklin D. Roosevelt, then an assistant secretary of the navy. In 1930 he was elected to the U.S. senate and was re-elected in 1936. In June 1941 he was appointed associate justice of the U.S. supreme court. After serving 16 months on the supreme court bench, he was named by President Roosevelt to head the newly created Office of Economic Stabilization on Oct. 3, 1942. On May 28, 1943, he was moved into another newly created office, topping all other government agencies, the Office of War Mobilization. His job was to settle disputes between top administrators, bring about increased co-ordination between agencies and smooth out relations with congress. One of his first acts was to name Bernard M. Baruch his personal adviser. During the latter months of 1943, Byrnes took much of the responsibility for holding down wages and prices. He could not, however, hold congress in line.

Byron, Arthur William (1872–1943), U.S. actor, was born April 3 in Brooklyn, N.Y. After a succession of stock company roles, he appeared in plays starring John Drew, Maude Adams, Mrs. Fiske, Maxine Elliott and Ethel Barrymore. His best performances were in *The Boomerang, The Lion and the Mouse* and *Tea for Three.* In 1936 he appeared with Katherine Cornell in *Saint Joan* and with John Gielgud in *Hamlet.* Celebrating his 50th anniversary on the stage, Byron in 1939 was seen in the Guild production of Stephan Zweig's *Jeremiah.* Byron, who also played character roles, was one of the founders of the Actors' Equity association and was elected as its president in 1938. He died in Hollywood, July 16.

Cabinet Members. The following members of President Roosevelt's cabinet held office on Jan. 1, 1944:

Post	*Name*	*State*
Secretary of State	Cordell Hull	Tennessee
Secretary of the Treasury	Henry Morgenthau, Jr.	New York
Secretary of War	Henry L. Stimson	New York
Attorney-General	Francis Biddle	Pennsylvania
Postmaster General	Frank C. Walker	Pennsylvania
Secretary of the Navy	Frank Knox	Illinois
Secretary of the Interior	Harold L. Ickes	Illinois
Secretary of Agriculture	Claude R. Wickard	Indiana
Secretary of Commerce	Jesse H. Jones	Texas
Secretary of Labor	Frances Perkins	New York

Great Britain.—At the close of 1943 the war cabinet was composed as follows:

Post	*Name*	*Party*
Prime Minister, First Lord of the Treasury and Minister of Defense	Winston Churchill	Conservative
Lord President of the Council and Deputy Prime Minister	C. R. Attlee	Labour
Secretary of State for Foreign Affairs and Leader of the House of Commons	Anthony Eden	Conservative
Chancellor of the Exchequer	Sir John Anderson	Conservative
Minister of Labour and National Service	Ernest Bevin	Labour
Minister of Production	Oliver Lyttelton	Conservative
Home Secretary and Minister of Home Security	Herbert Morrison	Labour
Minister of Reconstruction	Lord Woolton	—
Minister of State (Cairo)	R. G. Casey	(from Australia)

For other ministers and members of the government, *see* GOVERNMENT DEPARTMENTS AND BUREAUS.

Cacao: *see* COCOA.

Cadmium. The supply of cadmium in the United States continued to be well below demand. A survey by the War Production board for the third quarter of 1943 indicated a supply 25% short of requirements, and further restrictions were placed on uses of the metal in September.

In order to maintain a better control on distribution and use, sales to consumers were restricted until the usual consumers' stocks, equivalent to 8 to 12 months' requirements, were reduced to 2 to 3 months' requirements. The shortage was largely due to heavy consumption in aircraft (as electroplated parts), which was estimated to take about half of the total supply. While no official reports were made on production, world output in 1942 was unofficially estimated at 7,500 short tons, as compared with 4,200 tons in 1938 (G. A. Ro.)

Cady, Hamilton Perkins (1874–1943), U.S. chemist and educator, was born May 2 in Camden, Kan. A graduate of the University of Kansas, 1897, he took graduate work at Cornell and received his Ph.D. from the University of Kansas in 1903. Dr. Cady joined the staff at Kansas in 1899 and was named professor of chemistry in 1911 He and another faculty member identified the presence of helium in natural gas produced in Dexter, Kan., in 1907, which eventually led to the establishment of a helium plant in that vicinity. Dr. Cady also invented scales to determine molecular weight of gases, fostered research in liquid ammonia and was co-author of several books on chemistry. He died in Lawrence, Kan., May 26.

Calendar of Events, 1943: *see* pages 1–15.

California. A southwestern Pacific coast state of the United States (statehood granted Sept. 9, 1850). It is popularly called the "Golden state." Area, 158,693 sq.mi., including 1,890 sq.mi. of water; pop. (1940) 6,907,387, only 29% rural. A 1943 estimate, based on the issuance of War Ration Book No. 4, indicated that the population had risen to 7,814,676. Capital, Sacramento (105,958); other leading cities, Los Angeles (1,504,277); San Francisco (634,536); Oakland (302,163); San Diego (203,341); Long Beach (164,271); Berkeley (85,547); Glendale (82,582); Pasadena (81,864). Estimates for 1943 revealed substantial increases in population in each of these cities.

History.—On Jan. 4, 1943, Earl Warren was inaugurated as California's new Republican governor. His program, developed through action of the regular legislative session and a special one called on March 17, emphasized several changes from that of the previous administration. With the state income high, a tax reduction measure was drawn up by which it was estimated that taxes would be reduced in the next biennium by $65,000,000. A state guard program abolished the militia plan in force and substituted for it an organization based upon a community volunteer system. A State War council of about 100 persons (later reduced in size), representing the legislative and executive branches of the state government and also cities and counties of the state, was formed to co-ordinate defense plans with those of the armed services. A postwar planning council, particularly designed to cope with an expected tremendous postwar unemployment problem, and a food-and-fibre council, created to meet current agricultural harvest problems, were likewise set up. Governor Warren also backed an increase in the state old-age pension from $40 to $50 per month. During 1943 there was increasing mention of the governor as a vice-presidential possibility in the next national election.

A lessening of the danger of Japanese attack on the California coast resulted in changing the status of the aircraft warning service from an active to an alert basis on Oct. 16, and in lightening dimout restrictions substantially, effective Nov. 1.

Disturbances connected with war conditions occurred in two widely separated areas in the state during 1943. In Los Angeles, in June, fist-fights took place between service men and so-called (from extreme clothing styles) "zoot suit" gangs, many of whose members were of Mexican ancestry. In northern California, at Tulelake, a relocation camp used mainly for disloyal Japanese, the inmates rioted on Nov. 4 and held officials prisoner for several hours. The camp was then taken over from the War Relocation authority by the military.

Laxity in the enforcement of regulations in Folsom prison late in 1943 caused the removal of certain officials; a special session of the legislature was in prospect early in 1944 to consider changes in the state penal system.

In the economic field California took the lead over all other states in the U.S. in ship and plane production (9.9% of the total output). On Aug. 16 the first steel mill of the state (erected by Henry Kaiser at Fontana) started operation. Job stabilization started in the first month of the year. Occasional food shortages took place in congested areas, notably in milk products lines, and in all areas where defense plants operated or where military camps were located, serious housing shortages developed.

Education.—The amount assigned in 1943–44 to the public school system of the state was $78,914,772. Elementary schools, with an average daily attendance total of 689,876, were allotted $46,651,293 from state funds; secondary schools, with an average daily attendance of 348,371, were assigned $32,263,428.

Public Welfare, Charities, Correction.—State institutions numbered 19 in 1942: seven hospitals for the insane; two homes for the feeble-minded; three juvenile correctional schools; four prisons (three for men, one for women); two homes for war veterans; one home for the adult blind. The average population of these institutions (1941–42) was 36,347. Expenditures in 1942 for upkeep of institutions were $13,706,000. In the 1943–45 budget old-age pensions amounted to $96,733,000 of the total estimate.

Banking and Finance.—California state banks numbered 282 (82 departmental, 11 commercial, 13 savings, 10 trust companies, 166 branch banks). Deposits totalled $1,792,259,000 (1942: $1,469,844,000); total resources were $2,209,011,000. Property values in the state were assessed at $7,886,224,624. On Nov. 1 the state had $116,257,000 invested in war bonds. Receipts in the 1942–43 fiscal year amounted to $490,752,000 (1941–42: $345,443,602). Largest returns were derived from the unemployment insurance tax ($143,394,000; in 1941–42: $82,600,000). Other items were: bank and corporation tax, $18,433,765; liquor excise, $4,271,812; personal income tax, $10,312,343; motor and use tax, $1,412,828; retail sales tax, $3,060,602. The state budget for the 1943–45 biennium was $551,868,000. In the budget was included $43,750,000 for a postwar construction fund. Tax reductions over the previous biennium were estimated at $65,000,000. The state general fund showed a surplus of $84,200,000 on June 30, 1943 ($60,000,000 in 1942), which rose to $103,100,000 by Oct. 31.

Communication.—California in 1940 had 14,088 mi. of steam railway; 2,768 mi. electrified railway; approximately 900,000 mi. of public highway. During the 1941–43 biennium $82,093,000 was spent by the division of highways. Motor vehicles registered (Nov. 1) numbered 2,504,987 automobiles, 211,375 trucks, 18,930 motorcycles. In the first quarter of 1943, traffic deaths per million gallons of gasoline sold were 29.2 (in 1942: 24.3). In Sept. it was estimated that the state had 2,120,700 telephones (8% over 1942).

Agriculture.—The value of agricultural production in California in 1942 amounted to $769,722,000. Fruit and nut crops were valued at $325,539,000 (1941: $249,657,000); commercial vegetables at $154,539,000 (1941: $111,725,000); feed crops at $289,644,000 (1941: $218,433,000). Farm income in 1942 from livestock and livestock products was $294,136,000. The 1943 grape

crop was estimated at $122,000,000 in value and 1,596,000 tons in weight (1942: 1,398,000 tons); wine grapes amounted to 531,000 tons; table grapes, 498,000 tons, raisin grapes (fresh), 109,000 tons; dried raisins, 368,000 tons. The cotton crop for 1943 was expected to amount to 360,000 bales; the bean crop to 277,900 tons.

Manufacturing.—In 1943 aircraft and shipbuilding contracts awarded to California plants were valued at $6,801,654,000 for the former, $2,979,497,000 for the latter. Labour statistics indicated the total number of industrial workers in the state (including clerical, etc.) to be 1,138,000 in November (1942: 608,000). Employees (industrial) in durable goods plants numbered 709,300; in nondurable, 179,600. Women workers amounted to approximately one-third of the total. Average weekly earnings in durable goods plants were $57.63; in nondurable goods plants, $43.48 (in 1942, $52.03 and $43.48, respectively). In 1943 manufacturing reached a peak in production in the summer and then leveled off.

Mineral Production.—Total output was valued at $419,536,000 for 1942 (official est.). Petroleum again accounted for the largest amount.

Production of Principal Minerals in California, 1942

Product	Quantity	Value
Gold	48,000 fine oz.	$ 5,180,000
Silver	610,000 fine oz.	434,000
Copper	17,950,000 lb.	2,333,000
Lead	11,650,000 lb.	862,000
Zinc	3,750,000 lb.	424,000
Other metals	..	16,381,000
Petroleum	283,660,000 bbl.	299,752,000
Natural gas	452,840,000 M.cu.ft.	28,076,000
Miscellaneous stone	..	15,000,000
Brick	..	6,000,000
Cement	18,460,000 bbl.	28,244,000
Salines	..	15,950,000

California, University of.

A state-supported, coeducational university, with headquarters at Berkeley, but with six other campuses, at Los Angeles, San Francisco, Davis, Riverside, Mt. Hamilton, and La Jolla. During 1943, the University of California considerably revised its program and undertook numerous new activities in order to effect more complete utilization of its resources in the interest of the nation. On July 1 the university introduced a wartime calendar, comprised of three full terms of 16 weeks each, as well as one summer session of six weeks concurrent with part of the summer term.

Facilities and training were provided for military and naval units on four of the university's campuses. In February the college of agriculture at Davis discontinued civilian teaching for the duration of the war, and turned over the greater part of its facilities to the United States signal corps. At both Berkeley and Los Angeles instruction was provided for trainees in the army specialized training programs and the naval V-12 program, as well as for pre-meteorology and meteorology units of the air corps and for selected groups sent for intensive, technical courses. At San Francisco instruction was provided for a large unit of the United States nurses cadet corps and for men in both dentistry and medicine for the army and navy.

Education and training continued for civilian students. Every undergraduate civilian student was required to fulfil the national service course requirement, either by following professional curricula of importance to the war effort or by selecting, in addition to his normal curriculum, a group of related courses designed to prepare him for useful service in connection with the war.

Through various faculty committees and such agencies as the Bureau of Public Administration and the Bureau of Business and Economic Research, the university began to prepare for the postwar period. For statistics of enrolment, faculty, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (R. G. S.)

Cambridge University.

The number of matriculants in the academic year 1942–43 was 2,322, the second highest on record, as compared with 1,759 in 1941–42. The great majority of the 2,700 men undergraduates read scientific subjects, with resulting congestion in the laboratories. Science and engineering students who had passed the higher certificate with physics, mathematics, etc., might be allowed to complete a two-year or longer course, if their progress were satisfactory; but arts students were liable to be drafted to national service after reaching the age of 18 years.

There were 17 professorial vacancies. The following retired under the age limit: Professor Owen T. Jones (geology); Professor A. C. Pigou (political economy); Dr. P. H. Winfield (English law); Sir Frederick Gowland Hopkins (biochemistry); Dr. F. H. A. Marshall (reader in agricultural physiology); and Dr. John A. Ryle, the regius professor of physic, vacated his chair to take up a post at Oxford. The following chairs were filled: Dr. A. C. Chibnall (biochemistry); Dr. J. F. Baker (mechanical science); Dr. R. A. Fisher (genetics); Dr. W. B. R. King (geology); Henry A. Hollond (English law); Dr. W. W. Grave was appointed registrary on the sudden death of Ernest Harrison.

A bequest of £440,000 from the late R. R. Cory for the botanic garden was the largest single benefaction ever received. The Pitt Press assigned a sum of £44,000 to endow from the profits of the organization a chair in American history.

Among distinguished members of the faculty who died were John Hilton, professor of industrial relations, a well-known broadcaster; Francis M. Cornford, emeritus professor of ancient philosophy; and Terrot R. Glover, former public orator. Many generations of undergraduates also regretted the death of Stanley Brown, for 43 years chief clerk of the Union society.

Camouflage.

Camouflage practises deception by concealing or disguising objects to render them unrecognizable to an enemy. For front-line fighting, available natural concealment provided the best camouflage. In the absence of

CAMOUFLAGED JAP PLANES at an airfield in the Wewak area, New Guinea, photographed during an Allied raid with parachute bombs in 1943

CAMOUFLAGE LESSON at West Point military academy. The cadets look at a model village through inverted binoculars; the effect is similar to viewing the earth from an altitude of 3,000 ft.

natural means, substitutes had to be devised. Netting, garnished with cloth strips, leaves and branches were draped to fuse a machine gunner and his weapon with the surrounding landscape or it might screen individual riflemen in advanced sharpshooting positions. Sacking might be coloured and shaped to imitate rocks, blending with stony soil or desert terrain. Net camouflage, properly trimmed and draped, transformed trucks, tractors and tanks into seemingly harmless haystacks. Another netting variation formed "flat tops" to screen antiaircraft guns emplaced for firing. If netting was not available, chicken wire, appropriately garnished, furnished suitable cover.

Men, horses, mules and inanimate objects were alike subject to camouflage. Soldiers appeared in dapple-painted clothing, ornamented with the foliage of their surroundings. In the tropics, vivid colours predominated in the soldier's individual camouflage; in the north, he dressed in white. If leaf or flower camouflage was used, the materials were kept fresh, since dead camouflage is worse than none at all. At the 1st service command camouflage school a "ragamuffin" suit was devised from coloured burlap garlands knotted together so that the outline of the soldier's body appeared in broken line and he easily melted into the immediate terrain.

Paints applied to battleships, trucks, tanks, jeeps or landing barges played a prominent part in camouflaging, haze-gray having the greatest disappearance value. Except where natural surroundings were particularly vivid, paint tones used were mostly neutral.

It was sometimes necessary to hide the location of industrial installations by elaborate flat-top camouflage. Whole factories disappeared under flats which, on their upper side, showed spying aviators only an innocent farm landscape with familiar barns, corn cribs, silos and rambling roads leading off into the distance.

One basic formula obtained whether camouflage was done in farm areas, cities or on battle lines, viz.: Either fuse the object with its immediate natural surroundings or bury it out of sight.

Military camouflage conceals, disguises or misleads by cleverly contrived means. Concealment might be used in mobilizing a striking force; location of important headquarters might be disguised to lose all of their military characteristics; and in the realm of misleading displays, phantom concentrations of dummy cannon, machine guns, antiaircraft guns and soldiers might be so arranged as to provoke a wasted enemy attack on an utterly worthless target. In Washington, D.C., the press carried headlines during 1943 concerning the presence of dummy aircraft guns and soldiers stationed on the roofs of government buildings.

In any case, good camouflage doesn't happen by chance. It is always carefully planned to be used in terrain which has been well studied in advance, and it is executed with the best possible natural or artificial media. The camoufleur, evaluating angles, light diffusion, colour and shadow factors, strives to have the attacking eye fail to see that which is protectively concealed. He always avoids harsh, straight lines, since they do not occur in nature.

All camouflage has two powerful enemies—the sharp eye of the low-flying reconnaissance aviator, and the exact, recording eye of the modern camera with its wide-angle lens, equipped with shutters synchronized to aeroplane flight. Camouflage which hoodwinks these two agents is indeed successful.

Camp Fire Girls. Besides achieving astonishing totals in pounds of waste fat and other salvage collected, war stamps and bonds sold (and bought), clerical and messenger service performed, supplies for hospital and U.S.O. recreation centres made, and other co-operation with war agencies, the Camp Fire Girls in 1943 did not neglect service to their communities.

Girls in the senior division of Camp Fire Girls (the Horizon clubs) trained themselves as child care, hospital and farm aides. With the two other leading national girls' organizations, Girl Scouts and Girl Reserves, standards of work and training were drawn up. A child care course was published by Camp Fire Girls, and many high school girls took this course and volunteered their service at day nurseries and child care centres where children of working mothers were cared for. The girls also proved themselves helpful and responsible in their services as junior hospital aides.

Farm Aides—A Guide for Group Leaders was published in 1943 by the three organizations jointly, the experience of the previous summer having indicated that supervision by trained adults, and preliminary training of the girls themselves, would add greatly to the efficiency of the work on farms and to the benefits of this work to the girls themselves.

The Horizon clubs (senior high school girls) carried out a

"World Horizons" project which led them to explore the possibilities of the coming air age and its implications in terms of "New Neighbours," "New Business," "New Careers."

With juvenile delinquency on the increase, particularly among the girls of early teen age, it became evident that membership in well-organized Camp Fire groups where girls enjoyed fun, friendship, guidance and service was one very effective way of offsetting this tendency, with the result that more women enlisted as volunteer leaders of Camp Fire groups, and the membership increased by 6%.

The recruiting, training and direction of these leaders was the major concern of the national and local Camp Fire councils, handicapped themselves by the draining off of their professional workers. The number of girls desiring membership far exceeded the trained leadership available.

At the meeting of the National Council of Camp Fire Girls held in Omaha, Neb., Oct. 19–22, 1943, Mrs. Quade C. Weld was re-elected national president. President Franklin D. Roosevelt was honorary president of Camp Fire girls in 1943 and Mrs. Roosevelt honorary chairman of the advisory committee. Miss Martha F. Allen was secretary and national executive and Earle W. Brailey treasurer. Lady (Walter) Hearn was president of British Camp Fire girls. (C. F. Lo.)

Canada, Dominion of. A dominion of the British Commonwealth of Nations (Statute of Westminster, 1931, 22. Geo. V.c.4.) covering all portions of North America north of the United States, except Newfoundland, Labrador and Alaska. The dominion is a federal union of nine provinces united under the terms of the (imperial) British North America Act of 1867—Ontario, Quebec, Nova Scotia and New Brunswick in 1867, Manitoba 1870, British Columbia 1871, Prince Edward Island 1873, Alberta and Saskatchewan 1905. Outside the provincial boundaries, the Yukon and Northwest Territories are under the dominion government. Area, 3,729,665 sq.mi.; pop. (1941) 11,505,898. Capital, Ottawa (pop. 154,585). Montreal is the largest city (city proper 890,234). Provincial capitals in the order of the provinces listed above are Toronto (city proper 657,612); Quebec (147,908); Halifax (69,326); Fredericton (9,905); Winnipeg (225,437); Victoria (42,507); Charlottetown (14,460); Edmonton (92,404); Regina (56,520). Other leading cities are Vancouver (271,597); Hamilton (167,830); St. John, N.B. (50,084); Kingston (29,545); Fort William (30,370); Port Arthur (24,217); Saskatoon (42,320).

The governor general in 1943 was the earl of Athlone; prime minister, William Lyon Mackenzie King.

History.—In the year 1943 the dominion government continued under the direction of Prime Minister Mackenzie King and the Liberal party, which had been re-elected on March 26, 1940. The Progressive Conservative party formed the official opposition with Gordon Graydon leading in the house of commons. John Bracken (*q.v.*), chosen Progressive Conservative leader at Winnipeg in Dec. 1942, had no seat in the dominion parliament at the close of the year 1943. The year was marked by the active appearance of two new political parties. *Le Bloc Populaire Canadien,* formed in Oct. 1942 by Maxime Raymond, had as the central themes of its program national independence, the frank acceptance of the federal principle, and the recognition of the family as the social and economic unit. On Aug. 22, 1943, at Toronto, the erstwhile Canadian Communist party formed the Labour Progressive party. The strength of these new parties was substantially shown when, on Aug. 5, they carried two of the four dominion by-elections, the Labour Progressives capturing Cartier (one of the Montreal ridings) and *le Bloc,* Stanstead, in rural Quebec.

In the provinces also was much political activity. On March 3 Mitchell Hepburn placed his resignation in the hands of Gordon Conant, the premier. Conant himself later resigned, owing to ill-health; his place was taken by Harry Nixon, leader of the Liberal party in Ontario. On Aug. 4 the provincial general elections were held, resulting in the total overthrow of the Liberal government. The Progressive Conservatives, led by George Drew (*q.v.*), captured the largest number of seats, 38, followed by the C.C.F., 34; the Liberals, 14; Labour, 2; Independent, 1. Drew was sworn in as premier. Coupled with the defeat of the late government was the dramatic rise of the C.C.F. to the position of second place in the legislature. In Prince Edward Island general elections were held in September. The Liberal party, which had come into office in 1938, was sustained with, however, a somewhat reduced majority. In the west the death of William Aberhart, the Social Credit premier of Alberta, was an event of considerable political significance. He was succeeded by Ernest Charles Manning and the ability of the government to carry the by-election in Red Deer might be regarded as an indication of its vigour under the new leadership. In spite, therefore, of the overwhelming absorption of the war, the year was marked by important and possibly far-reaching political changes.

On April 1, 1943 Anthony Eden, the secretary of state for foreign affairs of Great Britain, addressed a joint session of the Canadian parliament. Toward the end of May, Queen Wilhelmina of the Netherlands visited her daughter Princess Juliana at Ottawa. On June 16 Mme. Chiang Kai-shek addressed a joint parliamentary session in Ottawa, and also made a notable address at Montreal on China's role among the United Nations. In the middle of July, General Henri Giraud, chief of the French armies, was in Ottawa. Between Aug. 10 and 24 the Quebec conference brought to Canada President Roosevelt and Winston Churchill, the prime minister of Britain. At the conclusion of the conference, President Roosevelt visited Ottawa (Aug. 25), where he addressed a gigantic gathering of more than 30,000 persons before the parliament buildings.

The latter part of 1943 witnessed significant changes in Canada's diplomatic status. On Nov. 11 the Canadian and United States governments raised their legations to the rank of embassies. Ray Atherton became the first United States ambassador to Canada, while Leighton McCarthy became the first Canadian ambassador to the United States. A month later, Dec. 10, Canada elevated her legations in China, Brazil and the soviet union to embassies.

Forming the practical corollary to these diplomatic changes was close co-operation between Canada and the United States. On Aug. 21 a Canadian-United States Joint War Aid committee was set up to study the operation of the lend-lease and mutual aid legislation. At an earlier date, a joint economic committee discussed the opening of about 1,000,000 sq.mi. of territory in Alaska, the Yukon, British Columbia and the Northwest Territories. Immediate steps to assist the population were considered, as well as plans to increase the population by immigration. A highly interesting phase of mutual aid was the development by the United States war department of the petroleum fields at Fort Norman, Northwest Territories, in order to supply the Canada-Alaska highway. The scheme involved not only the exploitation of the petroleum fields proper, but the construction of a 500-mi. pipe line to White Horse, where the refineries and storage tanks were to be located. The whole plan encountered considerable criticism in the United States, and its further prosecution was problematical. In November Canada along with the United States and some 40 other nations signed at Washington, D.C., an agreement to feed, clothe and care for the civilian population of the axis-dominated countries, when they shall be liberated. The

United Nations' Relief and Rehabilitation administration, meeting in Atlantic City, N.J., assessed Canada's share of the $2,000,000,000 to $2,500,000,000 program at $90,000,000, or its equivalent in supplies. Other forms of Canadian-United States co-operation, more closely connected with the military phases of the war, are considered in the section, *Canada at War*.

In the domestic field, the Canadian government throughout 1943 sought to combat inflation. The floating of two Victory Loans rather than one, was an attempt in this direction. In the late autumn it was clear that more drastic measures must be employed. After an extensive publicity campaign on the radio and in the press, on Dec. 5, Prime Minister King outlined his anti-inflationary program. He proposed controlling wages and farm prices, pledging an exhaustive review of wage and price standards in the event of the cost-of-living index rising 3% over a two-month period. On Dec. 8 the ban on wage increases became effective, except in cases of "gross inequality, or gross injustice." During the year 1943 there were 328 strikes, an emphatic commentary on domestic conditions. (J. I. C.; S. LEA.)

Canada at War.—All information in regard to the operations and occurrences of the war which could be of service to the enemy was withheld by the government in 1943. The facts and figures here given are strictly confined to information disseminated by the government itself in the official monthly publication, *Canada at War,* and in departmental reports, bulletins and summaries.

In 1943 Canada entered on an increasingly active phase of its wartime role. Units of the Canadian navy and air force contributed to routing the enemy out of North Africa in the spring of the year. Throughout the summer, autumn and winter, the 1st Canadian division took an important share in the Sicilian and Italian campaigns. Thus Sept. 9, the fourth anniversary of Canada's declaration of war, witnessed all arms of the service in active and decisive operation. In Sicily, Canadian along with British troops broke the powerfully held Etna defense line, while in central Italy, Canadians maintained a steady advance in the face of determined resistance, inclement weather and difficult terrain. Canadian naval, air and land units, in co-operation with U.S. formations drove the Japanese out of Kiska in the Aleutian Islands, thus freeing the North American continent from fear of invasion.

The operations of the Canadian navy were diversified. Some units saw spectacular service in the Mediterranean and Pacific waters. The bulk of the Canadian navy, however, was concentrated in the North and Central Atlantic. There its duty was primarily that of convoy, and its chief enemy was the submarine. The type of duty to be performed emphatically conditioned the character of the Canadian fleet. It had in 1943 no ships larger than destroyers; the bulk of its 200 fighting vessels were escort ships of one kind and another. While the destroyers in commission in 1943 were acquired either from Britain or the United States, construction of vessels of this type in Canada had begun. In the year 1944 Canada planned to further increase its navy by adding medium cruisers and possibly aircraft carriers. As a result of its increasing naval power, Canada provided about one-half the protection for North Atlantic shipping. The cost in ships and men was heavy; 13 ships and more than 1,200 men were lost in the Mediterranean or in the Atlantic since the outbreak of war. The Canadian navy was thoroughly democratized through the "lower deck" system of advancement. Prospective officers were trained as ordinary seamen, proceeding through a year of practical experience before emerging in commissioned rank. Early in 1943 Rear Admiral L. W. Murray was appointed commander in chief, Canadian Northwest Atlantic. He was thus the first Canadian commander in chief to assume operational direction in a vital war area in which the enemy was actively engaged.

The royal Canadian air force saw world-wide service in 1943. Numbers of its personnel, attached to the British air force, engaged in the long-range bombing of German transportation and industrial centres. In October Canadian squadrons participated in all the raids on western Germany. Convoy patrol and anti-submarine operations in the Atlantic were increased, as it became possible to withdraw men and machines from the North Pacific theatre of war. The working of the British Commonwealth Air Training plan was expanded throughout the year. Canada carried about one-half the cost of the scheme, which totalled approximately $40,000,000 a month. In early 1943 the air crew graduates exceeded 50,000.

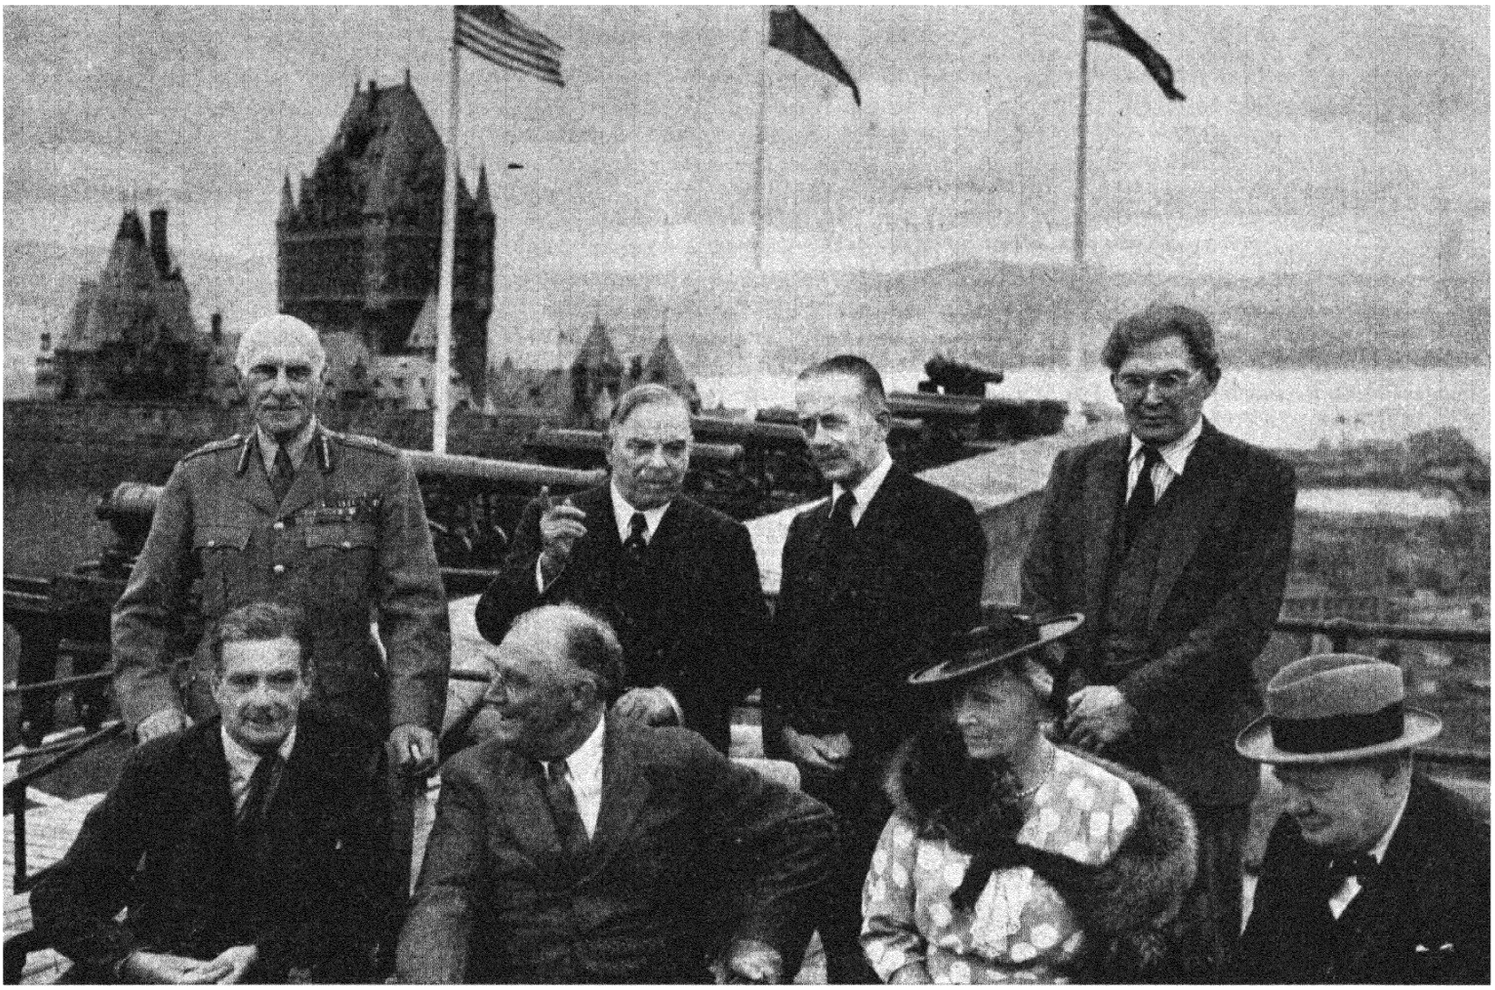
In August and September marked changes in the organization of the Canadian army were made. The 7th and 8th divisions and part of the 6th division, hitherto on duty in Canada, were broken out of their formations to provide reinforcements for troops in the field. Men considered unfit for active service were returned to civilian life. At the same time the number of training centres and, accordingly, the number of officers training, was reduced. In future a greater proportion of officers was to be drawn from men with overseas experience. By these means the Canadian home force was reduced by about 20,000 men. The Canadian overseas armies were composed of two corps of three infantry and two armoured divisions. In addition there was a large number of corps troops, engaged in transport, medical, forestry services, etc. The numerical strength of the Canadian army in November was officially stated to be 465,000 men. On Dec. 26 important changes were announced in the Canadian high command overseas. Lieut. Gen. Andrew McNaughton retired from the command of the Canadian army and his place was taken temporarily by Lieut. Gen. Kenneth Stuart. Lieut. Gen. Henry Crerar was appointed to the command of the newly formed Canadian corps in the Mediterranean area. The retirement of Gen. McNaughton was due to ill-health.

The increasing tempo of the war was reflected within Canada itself. This was best indicated by the intensive search for manpower. Responsibility for allocating manpower rested with the National Selective Service, under the department of labour. Beginning with April, six orders were issued transferring men from nonessential to such essential services as lumbering, farming, coal mining and munition manufacturing. In order to secure adequate labour for farm work, the unusual course was taken of releasing certain army personnel. On May 17 it was declared that a state of national emergency existed in respect to coal mining. Miners were prohibited from volunteering for the armed forces, were given automatic deferment from military training, or, if already enlisted, were given leave. In cities of more than 50,000 population, coal deliverymen were also "frozen" in their occupation. Competent university students were given deferment for one academic session only, unless they were enrolled in such courses as might be declared essential. Incompetent students were denied entrance, or if entered, were not allowed to remain at college. In order to meet the dangerous depletion of school staffs, teachers engaged in 1943 were retained in their profession. By these means, or by means of increased employment of women, attempts were made to meet the new wartime requirements.

Important financial adjustments were necessary in 1943. In March the fifth wartime budget was brought down. Of an estimated total expenditure of $5,500,000,000, considerably more than one-half was designated for war purposes, either for immediate national needs, or in the form of gifts of foodstuff or equipment for the United Nations. This vast sum of money was raised in part by taxation, but in larger measure by borrowing.

In fact, the budget brought only minor changes in taxation, usually in the form of adjustments in favour of certain groups in the armed services. The most important feature of the budget was the so-called "pay-as-you-owe" basis for income tax collection. Beginning with April, deductions were made at source on wages or salaries. Collections of other forms of income, *e.g.*, from investments, were put on a quarterly basis. The new tax scheme carried with it the wiping out of one-half of the tax on the 1942 income, except on invested income in excess of $3,000. For such, special provision was made. The adoption of the 1943 collection scheme seemed to have been dictated by administrative as well as political considerations, the number of taxpayers having expanded from about 250,000 in 1939 to over 2,000,000 in 1943. (For victory loans, etc., see *Finance,* below.) The drive for the sale of war savings certificates was maintained and even expanded in an effort to attract the small investor. The problem of war finance came, therefore, into increasing prominence. It contained such innovations as the instalment system of income tax collection and the tacit declaration on the part of the government of a new reliance on loans and borrowing, rather than on a "pay-as-you-go" basis of financing the war.

An important and integral part of wartime finance was price control. The agency most immediately concerned was the Wartime Prices and Trade board, which, under the minister of finance, dominated price control, consumer rationing and essential civilian supply. The activities of the board increased during the year 1943, when it became manifest that increased income, coupled with shortages in certain commodities, would cause a rapid rise in prices. In 1941 a price ceiling was established and a determined effort was made to hold, or at least to control, the prices of goods. As a result of the various control measures, food prices were kept relatively stable. In Jan. 1943 the prices of such commodities as tea, coffee and milk were actually reduced by means of subsidy, or by a reduction in import duty, as in the instance of oranges. The corollary of price control, wage control was politically dangerous. The National War Labour board, which administered wage control, had unfortunate difficulties with its personnel; L. J. Cohen, the original labour member, resigned. The numerous industrial disputes which marked the year 1943 may be regarded as indicative of the qualified functioning of the control measures. In an effort to offset inflation, the government throughout the autumn conducted a vigorous publicity campaign. In December the cost of living bonus was abandoned in favour of increases in the basic wage scale.



Closely associated with the conduct of the war on the home front were projects of postwar planning. The psychological value of such plans was recognized with the tabling of the Marsh report in March. The report took its popular designation from the name of its author, Leonard Marsh, research adviser to the Dominion Committee on Reconstruction. The report was a comprehensive document, embracing a study of contemporary social legislation, of principles underlying social security schemes and, finally, methods whereby such principles and experiences might be implemented. The Marsh report was, therefore, not a draft measure, but rather an initiation of the subject for discussion. Of more immediate effect were the provisions of the various rehabilitation plans for ex-servicemen. These covered a wide field ranging from clothing allowances to postgraduate courses at universities. In order to make these benefits more readily available, the ministry of pensions and health stationed welfare officers in the chief centres. To assist the welfare officers and to bring the task of rehabilitation close to everyday life, citizens' committees were established in practically every city.

Throughout 1943 various forms of civilian defense were maintained at a high level. Air Raid Precaution services had their headquarters at Ottawa, and established bodies across the country to study local conditions. The A.R.P. services were entirely voluntary and numbered in 1943 probably more than 80,000 persons in all branches. In the lower St. Lawrence valley, civilian defense organizations were carefully articulated with the protective system of the armed services in an effort to prevent a repetition of submarine raids on St. Lawrence shipping.

The fourth year of the war saw great advances in Canadian business. In spite of its small population, Canada reached the rank of third among the trading nations of the world. Canadian foods and Canadian munitions formed an important contribution to the armoury of the United Nations. The objective in food production was set very high, but it was not probable that all the objectives would be reached, because of shortages in farm labour and equipment and unfavourable weather conditions in central and eastern Canada. The processing and packing of meat was expected to exceed all previous records with 1,577,000,000 lb. packed during 1943. Extension in sheep breeding was undertaken in 1942 in order to increase both meat and wool supplies. Other foods destined largely for export were butter, cheese and powdered eggs; during the first eight months of 1943 nearly 10,000,000 lb. of dried eggs were shipped overseas. On the other hand, the wheat crop would probably be the lightest since 1937, in the neighbourhood of 300,000,000 bu. This was, of course, in response to direct government policy of reducing wheat acreage in favour of the acreage of feed grains. Significant experiments were undertaken in the course of the year looking to the production of peas, beans and oil crops suitable for supplying the liberated areas in Europe. In May a delegation of Canadian farm experts attended the United Nations Food conference at Hot Springs, Va. Problems relating to the production and distribution of food in the postwar period were discussed. The role of Canada with its considerable food-producing capacity was of great moment.

The production of munitions and ships in 1943 mirrored the new demands of war. The production of certain lines of equipment was reduced, while the production of other lines was accelerated. In the latter category stood naval vessels, guns, combat aircraft and radio location equipment. It was expected, therefore, that the change would be in kind, rather than in degree. A specific instance may be cited in the production of tanks, which would be discontinued largely in favour of engines and components for escort vessels, or self-propelling gun mounts. The production of instruments and communication sets for tanks, ships, planes and motorized vehicles was much accelerated. The manufacture of aeroplanes was likewise increased. In 1943 nine different types of aircraft were manufactured, and extended experiments conducted on other types, especially on cargo and transport planes. The aircraft industry employed more than 100,000 workers, about one quarter of whom were women. In view of the rapid expansion of this industry, it was expected that aircraft manufacturing would absorb workers from other programs which were curtailed.

The shipbuilding industry, which produced both cargo and war vessels, was expanded throughout 1943. Twenty yards were engaged in the merchant shipbuilding program, employing 43,000 men. In the second quarter of 1943 the rate of delivery was increased to one 10,000-ton ship every two days. Materials, like labour, were chiefly Canadian in origin. Cargo vessels were destined either for Canadian steamship firms, or for the ministry of war transport of the United Kingdom. After the war vessels chartered by the United Kingdom were to be returned to Canada and added to the Canadian merchant marine. The types of vessels chiefly constructed were 10,000 and 4,700 tonners, and oil tankers. The naval shipbuilding program was substantially increased. In the first half of 1943 contracts were let for 424

PRINCIPALS OF THE QUEBEC CONFERENCE on the citadel overlooking the Plains of Abraham in Aug. 1943. Front row, left to right: British Foreign Minister Anthony Eden; President Roosevelt; Princess Alice, wife of the earl of Athlone, governor-general of Canada; Prime Minister Winston Churchill. Rear row: earl of Athlone; Canadian Prime Minister Mackenzie King; Sir Alexander Cadogan, British permanent undersecretary of state for foreign affairs; Brendan Bracken, British minister of information

corvettes, frigates and steel minesweepers. Contracts were also let for wooden patrol vessels and minesweepers. The most considerable individual items of ship construction were two tribal class destroyers; in September one of these was launched. Eleven yards were engaged in warship building. The equipping of this rapidly growing fleet of war and merchant vessels was in the hands of 300 manufacturing firms which supplied everything from rivets to navigation instruments and marine engines.

The production of essential raw materials, timber, rubber, steel and nonferrous metals was much accelerated. Canada supplied Great Britain with 70% of its timber requirements, as well as providing 100,000,000 ft. to British commonwealth countries, and about 1,000,000,000 ft. to the United States. The production of rubber was increased with the opening of the Polymer corporation plant (a crown company) at Sarnia, Ont. It was expected that the plant would produce approximately 41,000 tons of synthetic rubber in the course of a year. As well as undertaking to meet its full war needs, Canada reduced its consumption of civilian rubber to 10% of what it was before the war. The reduction was still in progress by means of substitutes and reclaimed rubber.

The production of steel was placed at 5,000,000 tons for 1943. It was expected that more than 3,000,000 tons would be supplied by Canadian mills, the remainder coming from the United States. Canada manufactured all the necessary plate armour for her quota of tanks, armoured vehicles, gun shields and for certain naval purposes. Fine alloy steel for machine tools, armour and guns was produced in considerable quantities. Steel for shipbuilding and for making shells was produced also; the latter in quantity of about 250,000 tons a year. As a result of war stimulus Canada advanced to the position of fourth among the steel-producing states of the United Nations.

In the field of base metals Canada maintained its position as the greatest exporting nation in the world. Canada provided about 40% of the war requirements of aluminum of the United Nations and 95% of the nickel. In order to further increase the output of aluminum the government and the Aluminium Company of Canada opened the hydroelectric power plant at Shipshaw in northern Quebec, in the spring of 1943. Certain metals, such as magnesium and mercury, formerly imported, were produced at home, actually leaving a surplus for export. Magnesium processing was developed from experiments conducted in the laboratories of the National Research council at Ottawa, by Walter Pidgeon. The year 1943 witnessed not only accelerated production in practically every line of industry, but great strides toward self-sufficiency in vital metal production.

In August the Quebec conference, the sixth meeting of President Roosevelt and Prime Minister Churchill, took place. Canada acted as the host of the conference. In addition, Canadian political and military leaders participated in the discussions. This was the second occasion at which Canadian chiefs of staff were present at a general war parley. The first occasion was in May during the United States-United Kingdom discussion at Washington, D.C. At Quebec there was a joint session of the war committee of the Canadian cabinet and the war cabinet of the United Kingdom. In order to assure continuous consultation, Canada maintained a joint staff mission in Washington, D.C., which was present, along with the British and United States staffs, whenever discussions were of direct interest to Canada.

Co-operation between Canada and the United States became

extremely close in the course of 1943. The armed forces of the two nations served together in driving the Japanese from the Aleutian Islands, as well as in Sicily and Italy. At home Canadian and United States formations made joint use of facilities for training parachute troops at Camp Shilo in Manitoba and at Fort Benning in Georgia. The two countries also formed a Special Service force, drawn from their respective armies, which would provide the nucleus for combined operations, probably in the Pacific. These evidences of co-operation in the military sphere may be regarded as earnest of the engagements entered into at Ogdensburg and Hyde Park in Aug. 1940 and April 1941 respectively. In economic matters a Joint Agricultural committee was set up in March. The duty of this committee was to review food production and distribution in Canada and in the United States. In order to further co-ordinate Canadian effort with that of the United States, the Canadian government created a food requirement committee which was intended to work in close harmony with the Combined Food board of the United States and Britain.

Throughout 1943 women played an increasingly important part in Canada's role as a belligerent. Women in the armed services numbered about 36,000, divided between army, navy and air force units. A much more substantial group of women, numbering over 250,000 were absorbed by war industry. There were 830,000 women engaged in the vital work of farming. Innumerable women served as volunteer workers, staffing day nurseries, checking prices and issuing ration books. In an effort to mitigate the burdens of national service, 26 day nurseries were established across Canada. At these nurseries children were cared for and provided with a hot meal. (*See* also BUSINESS REVIEW.)

Defense.—See *Canada at War*, above.

Finance.—For the fiscal year 1943–44 the expenditure of the Canadian government was estimated at $5,500,000,000. Of this sum, $2,890,000,000 was intended for Canadian war purposes, with an additional $1,000,000,000 given to the United Nations in war supplies, equipment and foodstuffs; $610,000,000 was set aside for ordinary government outlays. The estimated revenue for the same period was $2,752,200,000. As the fiscal year does not end till March 31, it is difficult to state how accurate such budgetary forecasts are. Figures available up to Nov. 30, 1943 showed that the ordinary revenue had reached a sum of $1,752,456,426, while expenditure in the same period stood at $3,120,838,024.

The borrowing operations of the government were highly successful. Two Victory Loans were floated in 1943 and both were heavily oversubscribed. The Fourth loan undertaken in the spring with an objective $1,100,000,000 brought in a sum of $1,308,985,000; the Fifth loan, in the autumn, aiming at $1,000,000,000 actually netted $1,383,272,250. It was estimated that there were more than 3,000,000 cash subscribers to the Fifth Victory Loan. By means of the two loans, as well as treasury bills and two-year notes, the government provided itself with the sum of $3,227,260,750. The interest charges on such a sum were considerable, the interest on the public debt reaching $165,079,094. With any sharp decline in income a very serious situation might develop. In 1943 the national income was at a very high level ($8,500,000,000 estimated) and probably more widespread than ever before.

Trade and Communications.—In the interests of national security, it is impossible to give a complete outline of Canada's external trade in 1943. Information as to sailing directions and as to the character of goods exported was withheld. In the first ten months of 1943 exports of Canadian commodities were nearly 230% greater than in the same period of 1939. Of the grand total of $2,379,000,000, the sum of $837,000,000 represented exports to Great Britain and a sum of $911,000,000, exports to the United States. Thus it may be observed that World War II did not seriously alter the main outlets of Canadian trade. The war went far toward making Canada a creditor, not a debtor nation; likewise toward broadening the basis of its self-sufficiency.

Canadian transportation, as reflected in the reports of the Canadian National and Canadian Pacific railways, showed the stimulation of wartime business. The Canadian National anticipated a gross revenue of $440,000,000 for 1943, as compared with $375,000,000 for the year 1942. The Canadian Pacific reported increases of 70% in ton miles in freight and 250% in passenger miles over 1939. Yet these results were obtained with little increase in staffs, rolling stock or equipment. The most substantial advance in equipment was represented by the opening of the new Canadian National terminal in Montreal in July. This not only provided a thoroughly modern station, but further enabled the railway to consolidate its passenger traffic in the Montreal metropolitan region. The airlines of both the Canadian Pacific railway and the Dominion Department of Transport made notable advances during 1943. Preliminary figures showed that the Canadian Pacific Airways flew 70,000 passengers, 2,200,000 lb. of mail and 9,100,000 lb. of air cargo in 1943; comparable figures for the Trans-Canada Airways were 141,000 passengers, 3,900,000 lb. of mail and 840,000 lb. of express. Both railways gave increased attention to plans for the postwar period, and sections of the findings of the Canadian National railways were laid before the house of commons Committee on Rehabilitation and Reconstruction.

Agriculture.—The year 1943 was a difficult one for the Canadian farmer. As well as being faced with shortages in manpower and machinery, the direct consequences of the war, he was hindered by a late spring and an abnormally wet summer. Nevertheless, all demands for essential food commodities were successfully met.

Many Canadian farm products were destined for war export. The requirement of the British ministry of food for 675,000,000 lb. of bacon and pork products was satisfied. During the year about 7,000,000 lb. of butter and 16,800,000 one-pound tins of evaporated milk were shipped to the British food ministry. In the same period 10,080 short tons of dried egg powder (equivalent to 63,000,000 doz. eggs) were also dispatched to Britain. War demands caused the introduction of new crops, especially those producing vegetable oils. Hence, rape, linseed, flax and soybeans were grown extensively. They served industrial purposes, and some, like the soybean, had considerable food value. The grain crop in 1943 showed a marked decline, the wheat crop stood at 293,704,000 bu. Feed grains in the west were good and, with the free freight policy, farmers in eastern Canada and in British Columbia were assured sufficient food for their herds. The fruit and vegetable crop was light. Early in December a Dominion-Provincial Agricultural conference was held to map farm production for 1944. In most commodities the objectives for 1943 were called for again. To ease farming conditions more steel was to be released for the manufacture of agricultural machinery, 80% of the 1940 tonnage. At the same time National Selective Service policies applying to farm labour were more closely adjusted to meet the needs of this vital industry.

Manufacturing.—Throughout 1943 manufacturing was much quickened by governmental wartime expenditures. Munitions were turned out to the value of $55,000,000 a week. The output of army equipment reached its peak in the course of the year, and greater attention was directed toward the production of ships and aeroplanes. In November the 200th Canadian-built 10,000-ton merchant ship was delivered. Certain adjustments in the armament program were made necessary by the altering condi-

tions of the war. Men and supplies thus released were absorbed in other war productions, or in the manufacture of certain lines of goods for civilian consumption. The proposed increase in the manufacture of farm machinery, mentioned above, may be cited as evidence of this. The year 1943 saw remarkable increases in the means of production. At the end of January the hydroelectric plant at Shipshaw, on the upper Saguenay, was opened. The peak production of the plant was set at 1,200,000 horsepower.

(J. I. C.)

Canadian Literature.

Outstanding novel in 1943 was Franklin Davey McDowell's *Forges of Freedom,* which crystallized 14th-century England at the time of the peasants' revolt. Frederick Niven wrote about the 1745 Jacobite rising in Scotland and called it *Under Which King?* Maida Parlow French turned to the Canadian scene with *Boughs Bend Over,* which described the founding of the United Empire Loyalist settlement in Matilda township on the St. Lawrence river. Evelyn Eaton added another historical romance to her list with *The Sea Is So Wide,* the setting still in Nova Scotia. Marius Barbeau produced a vigorous historical romance of fur trading along the Laird river in the northwest a century ago, under the title *Mountain Cloud.* Stephen Leacock added to his reputation as a humorist with a volume of deliciously *Happy Stories Just to Laugh at.*

Poetry.—There were five major collections of poetry. The perennial and major voice of E. J. Pratt was heard in *Still Life,* a collection of satirical and lyrical poems. In *Challenge to Time and Death* Audrey Alexandra Brown turned to war themes. *Tasting the Earth* by Mona Gould was the first book by a young poet anxious about the men and women of her generation at war, and the poems had a deep understanding of human experience. Amabel King's *New Crusaders, and Other Poems,* divided its pages between poems of war and poems of peace and was marked by facile phrase-making. The list of 1943 poetry chapbooks was long. Outstanding among them were Mary Elizabeth Colman's *For This Freedom Too,* the poems of which all treated war; Evelyn Eaton's *Birds Before Dawn,* a collection of extremely short, jewel-like poems; Ernest Fewster's *Litany Before the Dawn of Fire,* a mixture of short lyrics and long symbolic poems; Irene Chapman Benson's *Journey into Yesterday,* which contained striking poetic imagery.

Frederick B. Watt's *Who Dare to Live* was a long narrative poem about Canada's merchant marine. Wilmot B. Lane's *The Closed Book* was an epic of the soul's quest. John Coulter's *Transit Through Fire* was the libretto of an opera of that name which depicted the experiences of a 1942 varsity graduate. Frederick George Scott, beloved padre of World War I, published his *Collected Poems.* An oddity was the appearance of *At the Long Sault,* a number of new and hitherto unpublished poems of long-dead Archibald Lampman.

Nonfiction.—Wallace Reyburn's *Glorious Chapter* was the first eye-witness account of the famous Dieppe raid. Amea Willoughby's *I Was on Corregidor* was another eye-witness account of the war in the Pacific zone. *Free Trip to Berlin* by Isabel Guernsey reported the experiences of 15 months in a nazi concentration camp after the torpedoing of the "Zamzam." In *Malta Spitfire* Leslie Roberts told the first-person story of George ("Buzz") Beurling's air fighting. In *The War: Fourth Year* Edgar McInnis continued his indispensable chronology of the great conflict. In *Canada in World Affairs* R. MacGregor Dawson surveyed the international relationships of Canada during the 1939–41 period.

Other books on wartime (and postwar) themes included *Discharged* by Robert England, which studied exhaustively the problem of the civil re-establishment of war veterans in Canada; *Which Kind of Revolution?* by W. D. Herridge, which presented a plan for using Canada's resources to lift the people to prosperity; *The Dawn of Ampler Life* by Charlotte Whitton, in which she presented her own ideas on this theme and also analyzed the Beveridge and Marsh reports; *Social Security and Reconstruction in Canada* and *Public Health and Welfare Organization in Canada,* both by Harry M. Cassidy, the first of which gave the historical background of the subject and the second of which examined in detail one of the more difficult aspects of social security.

Biography.—Elsie M. Pomeroy published *Sir Charles G. D. Roberts,* a definitive life of the great Canadian who died in 1943. Another volume in the literary field was *The Autobiography of Oliver Goldsmith* by Wilfrid E. Myatt, who was grandnephew of the noted British writer and Canada's first native-born English-speaking poet. In the historical field, Arthur S. Morton's *Sir George Simpson* turned out to be a vivid pen picture; and R. F. Longley's *Sir Francis Hincks* was a full-length study of Canadian statesmen of pre-Confederation days.

Juveniles.—Roderick L. Haig-Brown presented *Starbuck Valley Winter,* a novel describing the adventures of running a trap line in British Columbia. Olive Knox appeared on the literary scene with a first book, *By Paddle and Saddle,* a novel of a trip across Canada in the early 19th century by a young Scottish lad. Helen Dickson Reynolds added *The Cruise of the Mamie L,* a novel of salmon fishing off the British Columbia coast, to her long list.

Literary Awards.—In 1943 the Canadian Authors' association, sponsors of the annual governor-general's literary awards, made two important changes. The three divisions were expanded by breaking the general nonfiction division into academic nonfiction and creative nonfiction; and the medals, formerly of bronze, were changed to silver. Winners in 1943 (for books published during 1942) were: fiction, G. Herbert Sallans for *Little Man;* poetry, Earle Birney for *David and Other Poems;* creative nonfiction, Bruce Hutchison, *The Unknown Country;* academic nonfiction, Edgar McInnis, *The Unguarded Frontier.*

(C. Cy.)

Canadian-U.S. War Committees.

After 1941, the following committees were set up for joint Canadian-U.S. operation in the fields of defense, economics and war production: Permanent Joint Board on Defense; Material Co-ordinating committee; Joint Economic committees; Joint War Production committee; Joint Agricultural committee and Joint War Aid committee.

The Canadian joint staff mission in Washington was represented when the British-United States combined chiefs of staff discussed material of direct concern to Canada. Canada also became a member of the Combined Production and Resources board with the United Kingdom and the United States and in Oct. 1943 was admitted to full membership on the Combined Food board of the United Kingdom and the United States. The United States War Production board established an office in Ottawa, and the Canadian Department of Munitions and Supply and Wartime Prices and Trade board sent representatives to Washington.

At Hyde Park, New York, on April 20, 1941, the prime minister of Canada and the president of the United States agreed "as a general principle that in mobilizing the resources of this continent, each country should provide the other with the defense articles which it is best able to produce, and above all, produce quickly, and that production programs should be co-ordinated to this end." In accordance with the Hyde Park declaration, the

United States agreed to buy enough Canadian war goods to enable Canada to pay for essential U.S. war materials. The contracts that the United States placed in Canada, after Hyde Park, not only took advantage of Canada's much earlier conversion to war production but at the same time contributed to the elimination of Canada's urgent need for U.S. dollars required to meet the cost of war purchases in the United States. Canada did not use lend-lease accommodations utilized by other United Nations.

Permanent Joint Board on Defense.—This board was set up by the United States and Canada in pursuance of a joint announcement by President Roosevelt and the prime minister of Canada, W. L. Mackenzie King, dated August 17, 1940, at Ogdensburg, New York, for the purpose of carrying out "studies relating to sea, land and air problems, including personnel and matériel," and to "consider, in the broad sense, the defense of the north half of the western hemisphere." Recommendations of the defense board resulted in the construction of a chain of air bases between Edmonton and Alaska and of the Alaska highway.

Material Co-ordinating Committee.—Establishment of this committee was announced May 1, 1941, shortly after the Hyde Park declaration. Through subcommittees on forest products, copper, zinc and ferro-alloys, the movement of primary materials between the two countries is promoted, available supplies are increased and information is exchanged on raw material stocks, production and consumption in both countries. In determining the allocation of critical war materials, the United States War Production board reviewed Canadian applications on the same basis as those from United States domestic industry. Canada, for its part, poured its resources of vital raw materials into the common pot.

Joint Economic Committees.—Establishment of these committees was announced June 17, 1941. The committees were instructed to study and report to their respective governments on the possibilities of "(1) effecting a more economic, more efficient and more co-ordinated utilization of the combined resources of the two countries in the production of defense requirements (to the extent that this is not covered by other committees and agencies) and (2) reducing the probable postwar economic dislocation consequent upon the changes which the economy in each country is presently undergoing." A large portion of the program under (1) had been fulfilled by 1943 as a result of joint recommendations of the committees. After the middle of 1942 most of their efforts were concentrated largely on postwar problems. At the end of Sept. 1942, the committees agreed to sponsor a study, to be known as the North Pacific Planning project, covering economic development of the area adjacent to the Alaska highway.

Joint War Production Committee.—This committee was first set up as the "Joint Defense Production committee" by President Roosevelt and Prime Minister W. L. Mackenzie King (announced November 5, 1941), pursuant to a recommendation of the Joint Economic committees of Sept. 19, 1941. The objective of this committee was to reduce duplication, arrange uniform specifications and quick exchange of supplies, break transportation bottlenecks and exchange information. Ten technical subcommittees were established. In an exchange of notes Nov. 30, 1942, Canada and the United States expressed their desire to continue in the postwar world their wartime co-operation.

Joint Agricultural Committee.—The organization of this committee was completed in March 1943. The purpose was to keep agricultural and food production and distribution in Canada and the United States under continuing review. To co-ordinate policies of food production, and to supervise the preparation of information on Canada's food position, the dominion government set up the Food Requirements committee to work closely with the Combined Food board of the United Kingdom and the United States.

Joint War Aid Committee.—The formation of this committee was announced Aug. 22, 1943, during the Quebec conference. Its stated purposes were to study problems arising out of operations of United States lend-lease and the Canadian mutual aid program and, where necessary, make recommendations to the proper authorities. (*See* also BRITISH-U.S. WAR BOARDS.)

(W. E. TH.)

Canals and Inland Waterways.

The principal canals and inland navigable waterways of the United States include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York State Barge canal system, the Atlantic Intracoastal waterway extending from Trenton, N.J., to the Florida keys, the Gulf Intracoastal waterway extending from Apalachee bay, Fla., to the vicinity of the Mexican border, the San Joaquin-Sacramento river system in California, and the Columbia river system in the northwest. The Great Lakes have natural deep water except in the connecting channels which have been artificially deepened where necessary to accommodate deep-draught vessels. These connecting channels are the St. Mary's river and canal between Lake Superior and Lake Huron, the Straits of Mackinac connecting Lake Huron with Lake Michigan, the St. Clair river and lake and the Detroit river between Lake Huron and Lake Erie, the Welland canal joining Lake Erie and Lake Ontario, as improved by Canada, and the St. Lawrence river to the sea. The Mississippi river system embraces the river proper, the Red, Arkansas, Tennessee, Missouri, Illinois, Ohio, Monongahela, Allegheny and Kanawha rivers and other streams. The Mississippi river has a channel suitable for deep-draught, ocean-going vessels upstream to Baton Rouge, La., and thence a channel for modern barge navigation to Minneapolis, Minn., and in its principal tributaries which include the Ohio river and the Missouri river. The Illinois river and waterway to Lake Michigan has a barge channel which connects the Great Lakes with the Mississippi river system. An additional outlet from the Great Lakes to the sea is via the Oswego and Erie branches of the New York State Barge canal between Lake Ontario and the Hudson river. The Atlantic Intracoastal waterway and the Gulf Intracoastal waterway provide a protected channel for barge and other light-draught navigation following coastal sounds, bays, rivers and artificial channels. The San Joaquin-Sacramento river system, which has an outlet to the sea through San Francisco bay, provides a deep-draught channel to Stockton, Calif., on the San Joaquin river and a moderate-draught channel to Sacramento, Calif., on the Sacramento river and in addition other channel improvements. The Columbia river has a deep-draught channel to Portland, Ore., and to Vancouver, Wash., and depths suitable for commercial vessel traffic to the head of the pool formed by Bonneville dam and thence depths for barge navigation upstream to and including the Snake river.

Extensive dredging operations were executed on the Intracoastal waterway system, extending along the Atlantic and Gulf coasts, providing a more adequate channel for coastwise barge and other light-draught vessel traffic carrying petroleum products and other essential commodities. A channel of 12 ft. or more in depth heretofore authorized was made available throughout the Atlantic coast section of the waterway from Trenton, N.J., to Jacksonville, Fla. On the Gulf coast section of the waterway, work was actively prosecuted during the fiscal year 1943 on enlargement of the waterway between Carrabelle, Fla., and Corpus Christi, Tex., to provide a depth of 12 ft. in accordance with Public Law No. 675, 77th congress, approved July 23, 1942,

which authorized such improvements from Apalachee bay, Fla., to the vicinity of the Mexican border. Funds were made available by the second Supplemental National Defense Appropriation act approved Oct. 26, 1942, and work was commenced promptly thereafter. When the scheduled work under way in 1943 is completed a continuous improved waterway having a least depth of 12 ft. would be available from Carrabelle, Fla., to Corpus Christi, Tex.

The Tombigbee waterway, which is one of many feeder channels of the Intracoastal waterway, extends from Mobile harbour, Ala., far inland through the Mobile, Tombigbee, Warrior and Black Warrior rivers. The Mississippi river inland waterway system connects with the Intracoastal system at Plaquemine and New Orleans, La. This interconnected network of improved waterways brings barge navigation within reach of many important industrial and farming centres. Other important canals of the United States include the Cape Cod canal, Massachusetts, and the Chesapeake and Delaware canal, Maryland and Delaware, which accommodate ocean-going vessels; and the Okeechobee-cross-Florida waterway which affords a light-draught barge channel across southern Florida. (E. Rd.)

Great Britain.—In 1943 a good deal was being done in the way of adapting inland waterways generally to meet the requirements of traffic as a relief to the pressure on railways and roads. The catchment boards who in 1943 had the control and administration of most of the rivers in England, were proceeding with river training and improvement works throughout the country. A good deal of discussion was taking place in connection with the issue in August of the third report of the Central Advisory Water committee, which dealt with a proposal to constitute new river authorities to take over the responsibility for most, if not all, the functions exercised by a variety of bodies associated with river control.

It is a complicated question involving many and diverse interests: land drainage, flood prevention, water supply, public health, irrigation and agriculture, fisheries, commerce, industry and navigation, as well as those associated with countryside amenities and recreation. It would be a difficult matter to reconcile all these different issues, and opposition was being manifested by navigation authorities (ports and canals) to a fusion of their own special sphere of operation with that of water administration for public uses.

Another noteworthy development was the passing of the Grand Union Canal bill, by which that company acquired powers to engage in shipping operations and, in fact, to take an active interest in all forms of transport whether by land, sea or air. This was the first occasion on which a canal company had been granted such powers by parliament, and considerable opposition was manifested by the shipping companies.

Notable, too, during the year was the closing down of two old canal undertakings: the Glamorganshire canal, 25 mi. long, from Merthyr to the sea, with a descent of 560 ft. through 50 locks, and the small local Monkland canal in the Glasgow area.

Interest was revived in a mid-Scotland ship canal and a small departmental committee of the ministry of war transport was set up to examine the project.

Europe.—Not much information could be gleaned about inland water developments on the continent of Europe and in enemy occupied countries generally, but a project was mooted for the construction of a canal to link the port of Venice with the town of Locarno on Lake Maggiore, and there was a report that Japanese engineers were planning a waterway to afford an inland passage from the Sea of Japan to the Pacific. It would link Tsuruga or Ohama on the Japanese sea with Osaka through Lake Biwa and would have a ten-mile tunnel. (B. Cu.)

Cancer. The most interesting contribution to the subject of cancer during 1943, at least from a theoretical aspect, was contained in a long report from the National Cancer institute which stated that at last it has been found possible to produce cancer in normal tissues growing in a fairly simple culture medium.

The failure of other workers in this field had probably been due to the fact that it had always been difficult to keep cultures of adult tissues alive over a long period, especially when exposed to relatively large quantities of the carcinogenic substances, and that too small doses of the cultures were injected into the mice which were employed to test the cultures for malignant cells. A highly inbred pure strain of mice was used, but even under exactly similar conditions some cultures produced large numbers of tumours and others very few. The quantities of the carcinogenic substance 20-methylcholanthrene used were very small, one-thousandth of a milligram to each cubic centimetre of culture medium. Some cultures gave rise to tumours after a relatively short exposure; others required months. One culture strain was exposed for 406 days but did not produce as many tumours as from cultures treated for only a week or two and then allowed to grow for many months without further treatment. The most interesting discovery was that of two untreated control strains. One gave rise to some 8% of tumours, while the other produced a greater number than any treated culture. The authors go into a very elaborate discussion of this fact, pointing out that the amounts of the 20-methylcholanthrene needed to produce cancer are extremely small, and they attempt to explain the production of tumours from untreated cells by the possibility of contamination of the cultures with very minute quantities of carcinogenic substances which by some accident were transferred to these cultures during the manipulations which took place in carrying them on. The tissues have to be replanted very frequently in fresh solution, usually every three to four weeks.

The writer does not agree with this explanation, but on the contrary thinks that this phenomenon explains admirably a series of random observations which were collected from about 1910 on, and were hitherto difficult to understand. For example, the repeated injection of the solution of an aniline dye listed under the trade name of Light Green F.S. produced a few sarcomata when injected subcutaneously into albino rats. Japanese workers obtained malignant tumours in mice by the injection of concentrated glucose solutions. Others noted that tumour production followed the injection of acids or alkalies, even common salt, into the tissues; others produced a few tumours in mice by injecting cholesterol which had been given large doses of X-rays, and these examples could be considerably multiplied where the injection of substances which had apparently no carcinogenic properties under ordinary circumstances produced an occasional tumour. One of the most interesting of these types was reported about 1931 following the insertion under the skin of guinea pigs of small sealed glass tubes containing a minute quantity of radium. After about a year tumours appeared at the site of the tubes. No direct chemical action is possible here. The only radiations which got through the glass were the gamma and beta rays from the radium, but there could be no leakage of radium salt from the tube. It may be suggested perhaps the tumours were produced by the activation of the cholesterol of the tissues. However, it is well known from the studies of Harrison S. Martland of a group of dial painters that radioactive material, when swallowed in very minute quantities, will produce a considerable variety of bone sarcomas in human beings. Martland showed conclusively that this was due to the deposition of the radium in the tissues, chiefly of the bone marrow, and other radiations of various types were given off which kept up a

chronic inflammatory process, after a period of years followed by the appearance of tumour. Similar tumours have been produced in animals. Whether the authors' explanation of culture contamination is the correct one or not is not important, for it was generally believed in 1943 that the cancer process is due to a change in the quality of the normal cells of the body, a mutation perhaps, which renders them capable of growing indefinitely in their host. Hence cancer is frequently connected with chronic inflammatory processes or arises in tissues exposed for long periods to various irritating substances. The trend therefore on the whole has been away from the idea that there is any necessarily specific substance in the production of human cancer, though some of the hydrocarbons mentioned above, described originally by Ernest L. Kennaway and John W. Cook, were known in 1943 to occur in tar, soot and probably in certain lubricating oils and proved active generators of malignant growths in parts of the body which had been in contact with these oils for long periods. That soot is carcinogenic had been known for nearly 200 years. L. M. Shabad showed not only that the liver of persons who died of cancer contained a substance carcinogenic for mice, but lately found that the same is true of normal lungs of healthy persons, so that it is evident that in the body there are minute traces of substances which do not cause cancer in their healthy hosts, but do in the exceptionally sensitive reagent animal, the albino mouse, which has been so long employed in these studies.

Thus at last it was definitely shown that what had so frequently been assumed, that hereditary or other general susceptibility of the tissues of the body is necessary for the production of cancer, is not valid, and the results of the experiments just discussed also render it improbable that extraneous organisms, such as viruses, etc., play a necessary part in the inception of cancer.

From the diagnostic aspect of the cancer problem, an interesting series of publications appeared on the early diagnosis of cancer of the uterus by the microscopic examination of smears from the vaginal secretion. The original paper by George N. Papanicolaou and Herbert F. Traut appeared in the *American Journal of Obstetrics and Gynecology*, 42:193, Aug. 1941. Following that account, a well illustrated atlas of the microscopic appearances of the cancer cells seen in such smears was published by these authors, together with several papers by others confirming the results. A very considerable experience is required for this method, which is similar to the demonstration of cancer cells in abdominal and chest fluids, but the expert can render a correct opinion in a considerable percentage of cases of cancer. Obviously a positive diagnosis must be substantiated by examination of curettings before operation or radium treatment is undertaken. The importance of this study is that many patients can be diagnosed who will not submit to a surgical operation or removal of a biopsy specimen, and by this means the average time loss from the onset of symptoms may be considerably reduced from the usual six or seven months' lapse between the first symptoms and the application of the proper methods for cure.

The treatment of cancer of the prostate gland by orchidectomy has been carried on sufficiently long so as to judge roughly the relief period which this treatment offers. No one has assumed that such treatment will cure a malignant disease, but the occasional relief of symptoms was so prompt and complete that a little undue optimism was apparent in medical publications. It was by 1943 beginning to be recognized that while an occasional patient is completely relieved of symptoms for a time the procedure fails in a considerable proportion to be of any real benefit, and that sooner or later the disease again becomes active. The real value of the procedure is that the favourable results afford the occasional patient complete relief of pain and confer ability to return to work for six months or even a year. In some instances the relief period was even longer, but these were few.

Cancer of the bladder has long been regarded as one of the most difficult types of cancer to treat. Very few of the patients appear in time for radical surgery, and many have to be satisfied with the destruction of the growth by means of electrocautery, in other words, a more or less palliative procedure. With the advent of 1,000,000-volt X-ray apparatus, it was hoped that a certain number of permanent cures could be obtained, and unquestionably an occasional patient will be cured with such treatment. Even with treatment by 200,000-volt radiation a considerable proportion may be relieved of all symptoms for a very considerable time, but reports appearing from institutions where 1,000,000-volt apparatus was available showed that while excellent palliation might be obtained for a very considerable time, sooner or later most of the patients had a recurrence of the tumour with the usual fatal termination. It was much too early to judge the final results.

Reports concerning the treatment of cancer with neutrons did not reveal any definite superiority to the results obtained with correctly applied roentgen rays or radium.

Candy. Of the 2,500,000,000 lb. of candy produced in 1943, about 20% was shipped to the armed forces in the United States and abroad. The army again included hard candy for Ration K, and the soldier's "last ditch" or extreme emergency food package, known as Ration D, contained a special type of chocolate and sugar, two of the most important candy ingredients. The Jersey City quartermaster depot and the candy industry developed in 1943 a chocolate bar which will remain solid up to 120° F. This bar, used by the armed forces in excessively warm climates, is made of sugar, skim milk powder, cocoa fat, oat flour, artificial flavouring and vitamin B. In addition, varieties of candies, particularly 5-cent and 10-cent bars, were purchased in large quantities for resale at post exchanges.

The industry's 1943 candy tonnage was produced by approximately 1,200 manufacturers in Chicago, Boston, Philadelphia, New York and other sections of the country, employing 50,000 persons, mostly women. The gain in volume over the 1942 figure was about 8% while the dollar value increase was approximately 20%. This was due to the fact that many candy manufacturers converted large portions of their output to higher priced candies, with the unit price of most items showing only a slight increase over 1942 prices. The average value of candy in 1943 was 19 cents per pound compared with 18 cents in 1942, 16 cents in 1940 and 14 cents in 1938.

However, instead of stressing the production of penny goods and five-cent bars, as they did in the years preceding World War II, candy manufacturers in 1943 went to higher priced goods, featuring fancy packages and other maximum priced units. Of the 2,500,000,000 lb. of candy made in 1943, the distribution was divided in approximately the following manner: penny goods, 10%, average value, 15 cents per lb.; bars (1-cent, 5-cent and others), 35%, average value, 22 cents per lb.; bulk candy, 20%, average value, 14 cents per lb.; 5-cent and 10-cent packages (other than bars), 12%, average value, 21 cents per lb.; plain packages, 15%, average value, 25 cents per lb., and fancy packages, 10%, average value, 75 cents per lb. In 1942, fancy packages amounted to only 1.2% of the entire tonnage while in 1939 it was less than 1%.

For the second year in its history, the candy industry in 1943 met sharp curtailment of ingredients. The sugar ration for most of 1943 was 80% of base period use. For the final quarter of the year, however, candy manufacturers, together with other industrial users, received a 10% "bonus" of sugar. This meant a 90% allotment of base period use. During the first six months of 1943, the candy industry received 60% of its chocolate requirements. On July 1, the War Food administration increased the quota to 70% of base period use while another 10% increase was granted the industry on October 1. The changed war picture and improved shipping were the factors responsible for these increases. Corn syrup and other corn products were not rationed in 1943 but, because of a corn shortage, refiners followed a "voluntary rationing" program. Candy manufacturers, however, received a minimum of 100% of base period use on all of their corn products. Many candy plants in 1943 continued to devote large portions of their facilities for the production of radio, plane, gas-mask parts and other non-edible necessities.

Towards the end of the year, the industry with the aid of the U.S. department of agriculture launched a research development program, the purpose of which was to find greater use for soybeans, peanuts, cottonseed and other home-grown agricultural products in the production of candy. (H. D. G.)

Cane Sugar: *see* SUGAR.

Canning Industry. U.S. and territorial canned food production in 1943, including canned vegetables, fruits, fish, and milk, totalled about 420,000,000 cases as compared with 450,000,000 in 1942. Regular canned food items were packed in somewhat lower quantities than in 1942, because of difficulties resulting from delays in announcement of government policy, changes in regulations, shortages in manpower, and adverse climatic conditions in certain sections. Reductions were noted especially in the case of fruits and vegetables. Lesser reduction occurred in packs of specialty items, fish, and milk. There was a material increase in the pack of canned juices. At the beginning of 1944, statistics on the pack of meat products were incomplete. Considerable quantities of special rations were canned for the armed forces, but production statistics were not available.

Preliminary statistics for the major commodities in 1943, as compared with 1942, were:

	1942	*1943*
Fruits, cases	60,773,000	46,310,000
Vegetables, cases	229,023,000	208,881,000
Juices, cases	36,613,000	46,256,000
Specialties, fruit and vegetable, cases	32,428,000	20,000,000
Fish, cases	18,070,000	17,000,000
Milk, cases	77,318,000	72,965,000

For civilian consumption the 1943 pack of commercially canned food was supplemented by a record output of home-canned foods, estimated at about 260,000,000 cases.

Government restrictions on the use of tinplate were continued in 1943, governed by orders from the War Production board and War Food administration. There was an increased use of so-called "substitute" plates for cans, such as electrolytic plate having a weight of 0.5 lb. of tin per base box as compared with 1.25 lb. for the conventional "hot-dipped" plate, and "bonderized" plate which did not have tin coating but was chemically treated and enamelled to reduce corrosion. As a further measure in tin conservation there was increased use of lead-silver solder, which contained no tin. Extensive research was done by can manufacturers and the canning industry to determine the usefulness of substitute plates for the different classes of canned foods, and consideration was given to determine a proper balance between tin conservation and the "shelf-life" of the container.

ITALIAN WAR PRISONERS were placed to work in a cannery at Mount Morris, N.Y., in the fall of 1943 to help relieve the labour shortage

Late in 1942 the industry was urged to find a means of protecting the exterior of cans for army and navy overseas shipments. Such coating, to be practicable under 1943 production conditions, would have to be applied after the canning operation and possess the property of protecting the metal from rust and deterioration under extreme corrosion conditions. A study was undertaken jointly by the can manufacturing and canning industries and the properties of various coatings were investigated. The principal work was done with lacquers, paints, and waxes. The tests showed that adequate protection may be given by a number of coating materials and much of the 1943 and 1944 packs were to be coated for army and navy use.

The extensive nutrition studies begun in 1942 were continued and expanded in 1943 and were devoted exclusively to the study of nutrition values in heat-processed foods. This work, supported by the canning and can manufacturing industries, was planned first to determine the dietary factors as they existed, and later to study technological factors which affected these values. The work was carried on through financial grants to universities recognized for excellence in the field of nutrition and the findings of the research were made available to official agencies. In 1943 principal attention was given to determination of vitamin retentions in canning processes and a number of the more important canned foods were included.

Operations in the canning industry in 1943 were affected profoundly through applications of government decrees, delayed government policies, indecision as to future government plans, pricing methods, labelling, and related questions. The situation at the beginning of 1943 was indefinite through lack of facts from which the industry could make plans and this situation obtained at the beginning of 1944.

The rationing program brought canned foods under the point system in March 1943, on the basis of supplies then available, and point values were set to move supplies smoothly into consumption until the period of the next pack. (E. J. C.)

Carlson, Evans Fordyce (1896–), U.S. marine corps officer, was born Feb. 28 at Sidney, N.Y. He attended high school for a brief period, enlisted in the army when he was 16, and was honourably discharged in 1915 as a top sergeant. He was recalled at the time

of the Mexican border troubles and later went overseas to France during World War I. He was mustered out in 1919 with the rank of captain, having received French and Italian decorations and a citation from General John J. Pershing. Carlson, however, chafed at the torpor of civilian life, and in 1922 he enlisted in the marines as a private. He was commissioned as a second lieutenant in 1923 and was assigned to duty in Central America and the orient. In 1937 he made a 2,000-mi. trip into China, observing the tactics employed by Chinese communist guerrillas in fighting the Japanese. Carlson subsequently resigned and revisited China in 1940 and 1941 as a civilian. Convinced that a U.S.-Japanese war was inevitable, he rejoined the marines and in May 1941 was returned to active duty as a major. In 1942 he was given command of a marine corps raiding unit. "Carlson's raiders," as they were later known, were thoroughly schooled in tactics similar to those employed by British commandos and Chinese guerrillas. In Aug. 1942 Carlson and his raiders staged a successful raid on Japanese-held Makin Island and later saw action on Guadalcanal. Carlson also participated in the invasion of the Gilbert Islands, Nov. 20–23 and after the battle declared: "Tarawa was the toughest job in marine history."

Carnegie Trusts.

Carnegie Corporation of New York, established by Andrew Carnegie in 1911 and endowed with $135,000,000, devotes its annual income to grants to institutions and agencies whose activities aim at the advancement and diffusion of knowledge and understanding among the people of the United States and of the British dominions and colonies.

During 1942–43, the corporation trustees appropriated a total of $2,562,900: library interests, $82,250; fine arts and museums, $38,500; research and publication $296,703; general educational purposes in schools, colleges, universities, etc., $2,145,447. The amount appropriated since 1911 totals $189,798,099.

The five other separately administered Carnegie organizations in the United States, which were founded by Mr. Carnegie for specific purposes before the establishment of the corporation, with endowments ranging in 1943 from $10,000,000 to $30,000,000, followed their established programs described regularly in their annual publications.

Carnegie Institute of Pittsburgh (1896), which comprises a museum of fine arts, a music hall, a museum of natural history, a public library, and an associated institute of technology with a library school, carried out its stated programs with modifications in staff and facilities caused by war conditions.

Carnegie Institution of Washington (1902), devoted to scientific research, has expended since its organization some $50,000,000 in its program of encouraging investigation, research and discovery, and the application of knowledge to the improvement of mankind, specifically by work in astronomy (Mt. Wilson observatory), terrestrial magnetism, geophysics, animal and plant biology, and historical research (especially in Yucatan). Most of its staff and a major part of its research facilities were engaged in services relating to the national emergency.

Carnegie Hero Fund Commission (1904), established to recognize heroic acts performed in the United States of America, the dominion of Canada, the colony of Newfoundland, and the waters thereof, by persons the nature of whose duties in following their regular vocations does not necessarily require them to perform such acts, announced that the list of its beneficiary aid showed a total of 3,292 medal awards and a total of $6,455,942 in pecuniary awards.

Carnegie Foundation for the Advancement of Teaching (1905), established to provide retiring pensions for teachers and to advance higher education, paid $1,931,238.72 in retiring allowances to retired college professors, or their widows, making a total of $44,424,603.59 paid for such purposes since its establishment. It also continued, chiefly from funds provided by the corporation, its program of educational research, including such activities as teacher-testing program, graduate examination study, etc.

Carnegie Endowment for International Peace (1910), established to serve the purpose indicated by its name, expended its income in research, study, and conferences on the causes of war and international misunderstanding. (R. M. Le.)

Caroline Islands: *see* Pacific Islands, Mandated.

Carver, George Washington

(*c.* 1864–1943), U.S. Negro chemurgist and agricultural expert, was born of slave parents near Diamond Grove, Mo. Dr. Carver, who was a member of the Tuskegee institute in Alabama from 1896 until his death, was appointed collaborator in the division of mycology and disease survey in the bureau of plant industry of the U.S. department of agriculture in 1935. His devotion to the improvement of farming conditions in the south and his development of hundreds of new synthetic products from peanuts, cotton and soybeans are world-famous. He was awarded the Spingarn medal in 1923 and the Roosevelt medal in 1939. Dr. Carver died in Tuskegee, Ala., Jan. 5. (See *Encyclopædia Britannica.*)

Casey, Richard Gardiner

(1890–), Australian politician, was born Aug. 29, and was educated at Melbourne university and at Trinity college, Cambridge. Casey served as liaison officer between the Australian government and the British foreign office for seven years, leaving this post in 1931 to enter the Australian house of representatives. During his nine-year tenure in the house, he acted as assistant federal treasurer, federal treasurer, minister in charge of development and minister for supply and development. His government sent him to London for the coronation and imperial conference in 1937, and in 1939 he again represented Australia at the London conference on the conduct of the war. Casey left the house of representatives in 1940 to accept the portfolio as Australian minister to the United States, where he remained for two years. Prime Minister Churchill recalled him in 1942 and placed him in the United Kingdom war cabinet as minister of state in the middle east. On Dec. 23, 1943, he was named governor of Bengal in what appeared to be a government move to alleviate the critical situation in that famine-ridden province.

Catastrophes: *see* Disasters.
Catholic Church: *see* Roman Catholic Church.

Catholic Community Service, National.

The National Catholic Community service is the agency designated by the Catholic Church in the United States to serve men and women in the armed forces and war workers in overburdened industrial communities. A member agency of the United Service Organizations, it provided in 1943 a wide variety of services designed to promote the spiritual, recreational, social and educational welfare of servicemen, servicewomen and war workers. It served also the wives and children of servicemen.

The N.C.C.S. was a development of the National Catholic War council, its counterpart in World War I. Like its predecessor, the N.C.C.S. was organized to serve men and women of every race and creed, but differed from other war service agencies in its special services for Catholics. As of Jan. 1944 it managed a

total of 512 operations at home and abroad, 39 of which were supported by the N.C.C.S. independently of the U.S.O. and included clubs in Egypt, Hawaii, Australia, the Fiji Islands and England. (P. Dc.)

Catholic Library Association.

An international organization of librarians, educators and others interested in Catholic intellectual life, to promote Catholic literature and to develop and extend Catholic library work. The association was founded in 1921, as the library section of the Catholic Educational association: it became an independent body in 1931, and was incorporated under the laws of the state of Wisconsin in 1936.

The membership in Sept. 1943, was 1,086. Two new units, Galveston, Texas, and Boise City, Idaho, were added to the 18 local divisions. The regional and local units meet from two to six times annually, publish bulletins of professional and news interest, and bibliographies for elementary and high school libraries as well as for the general public.

The annual conference in 1943, scheduled for Buffalo, was cancelled because of travel restrictions.

The principal means by which the Catholic Library association attains its objectives are the publication of the official organ, the *Catholic Library World,* of the *Catholic Periodical Index,* and of the *Supplement* to the *Reading List for Catholics;* the maintenance of a central office for information, and of an agency for the bibliographical works of Rev. Stephen A. Brown, librarian in Dublin; and the promotion of National Catholic book week, which in 1943 was observed Nov. 7–13.

Publications during 1943 included the quarterly issues of the *Catholic Periodical Index* (publication of the four-and-one-half year cumulation, scheduled for Nov. 1943, was delayed because some European periodicals did not arrive); three additions to the bio-bibliographical series, *Contemporary Catholic Authors;* the *Catholic Library World* (1929–) published monthly from October to May. Officers for 1943–45 were Rev. Andrew L. Bouwhuis, S.J., Canisius College library, Buffalo, N.Y., president; Richard James Hurley, Library School, Catholic University of America, Washington, D.C., vice-president; Dorothy E. Lynn, University of Scranton, Scranton, Pa., secretary-treasurer. Official headquarters are at the office of the secretary-treasurer.

(A. L. Bs.)

Catholic Organizations for Youth.

Each of the 18,976 Catholic parishes in the United States in 1943 promoted one or more organizations for youth. In 1940 the archbishops and bishops had established within the framework of the National Catholic Welfare conference (*q.v.*) a youth department charged with the responsibility of guiding and developing the Catholic youth apostolate and promoting, as the national, unifying and co-ordinating structure of all approved Catholic youth groups, the National Catholic Youth council.

The National Catholic Youth council is comprised of a diocesan section and a college and university section. The college and university section comprises two national student federations, the National Federation of Catholic College Students, uniting in 1943 the student bodies of some 90 Catholic colleges, and the Newman Club federation, uniting the Catholic student clubs in over 500 non-Catholic colleges. The diocesan section of the N.C.Y.C. is comprised of the diocesan youth councils, which in turn are made up of parish youth councils.

The constituent youth groups within the parish youth council continued in 1943 to receive program services from their parent bodies, such as the Sodality of Our Lady, the Mission Crusade, and in some places the Catholic Youth Organization (C.Y.O.). Some of the larger of such groups in 1943 were: The Sodality of Our Lady, 3742 W. Pine blvd., St. Louis, Mo., with 9,626 units totalling 806,800 members; the Catholic Students Mission Crusade, Shattuc ave., Cincinnati, Ohio, with 2,978 units totalling 600 members; the Junior Catholic Daughters of America, 39 Manchester terrace, Mount Kisco, N.Y., with some 1,000 units totalling 15,000 members; the Columbian Squires, 45 Wall st., New Haven, Conn., with 408 units totalling 16,961 members; the Catholic Central Verein, 3835 Westminster place, St. Louis, Mo., with 25,000 members; and the Catholic Boy Scouts, with 4,385 troops under exclusively Catholic auspices. In 102 of the 116 dioceses of the United States the bishop had by 1943 appointed a Diocesan Youth director with the responsibility of guiding and directing all approved youth groups in the diocese.

(P. F. T.)

Catholic Rural Life Conference, National.

A national organization of bishops, priests and lay persons, founded in 1923 and dedicated to the economic, social and spiritual interests of the U.S. farmer. It functions as an educational and propaganda agency within the church for the application of the principles of Catholic philosophy to the sphere of agriculture.

Instead of the 21st annual convention a wartime meeting was held at Milwaukee, Wis., Oct. 9–13, 1943, attended by 400 delegates for the purpose of strengthening the work of the conference both during the war and in the postwar period. The conference went on record in favour of: (1) the farm co-operative movement to protect the family-type farm from economically powerful groups; (2) the government as custodian of the common good, seeking to achieve the widest possible distribution of land ownership; (3) the parity-price principle for agricultural products in relation to industrial products; (4) subsidies to farmers as a temporary, emergency measure.

The Most Rev. Aloysius J. Muench, bishop of Fargo, N. D., and president of the conference, presided at the conference's annual dinner.

The war activities of the conference were predominant in the rural-life schools of 1943, which were effective beyond expectation. The conference continued to work in co-operation with non-Catholic groups and governmental agencies, and entered into an understanding with the American Federation of Labor and the Congress of Industrial Organizations.

The Most Rev. Joseph H. Schlarman, bishop of Peoria, Ill., was elected president, and the Rt. Rev. L. G. Ligutti was reappointed executive secretary. *Land and Home,* a monthly, is the official publication. Permanent headquarters were at 3801 Grand ave., Des Moines 12, Ia. (J. LaF.)

Catholic Welfare Conference, National.

The conference was organized by the bishops of the United States in Sept. 1919, to unify, co-ordinate and organize the Catholic people of the United States in works of education, social welfare, immigrant aid and other activities.

The 25th annual meeting of the conference was held at Washington, D.C., Nov. 10–12, 1943, and was attended by 100 members of the hierarchy. Officers elected to the administrative board were: chairman of the administrative board, Most Rev. Edward Mooney, archbishop of Detroit, Mich.; vice-chairman and treasurer, Most Rev. Samuel A. Stritch, archbishop of Chicago, Ill.; secretary, Most Rev. Francis J. Spellman, archbishop of New York, N.Y. The Most Rev. John G. Murray, archbishop of St. Paul, Minn., and the Most Rev. James H. Ryan, bishop of

Omaha, Neb., were elected as new members of the board.

The assembled archbishops and bishops at Washington sent their traditional message of greeting to the Holy See, and confirmed their offering of $350,000 to the pope for distribution among the distressed peoples in the war zones. The hierarchy declared in a published statement that the Moscow conference had failed to dispel the fear that the ideals of the Atlantic Charter were compromised.

In the field of international relations, the preparation of material centring around the papal peace program, especially in its application to the postwar world, was the outstanding achievement. Spanish and Portuguese translations of the pamphlets on U.S. peace aims and the world society were issued.

The social-action department sponsored a conference on the religious and economic problems of Spanish-speaking groups in the United States, held during the week of July 19 in San Antonio, Tex. The report of the recommendations of the conference was widely distributed among clerical and lay leaders. The proposed National War Service act for drafting men and women into war industries was opposed by the administrative board in letters sent by the executive secretary to committees of the senate and house of representatives.

War relief services for morale and character for refugees, prisoners of war, and people in devastated areas were established, and operations were begun during 1943.

One of the most important works undertaken by the conference was the printing and distribution of the *Acta Apostolicae Sedis,* the official organ of the Holy See, which began publication in Sept. 1943, for many countries in which distribution of this official organ of papal documentation had ceased after Dec. 1940.

A new nationwide Catholic radio program, "The Hour of Faith," was inaugurated over the Blue network Oct. 19. The press department, through the N.C.W.C. news service, strengthened its coverage of Vatican news, and became the only source of reliable and complete information on Vatican wartime thought and activity. Publications subscribing to the news service increased to 204 in 32 countries. Subscribers to the Spanish-language news service increased considerably during 1943.

National offices are located at 1312 Massachusetts ave., N.W., Washington 5, D.C. The N.C.W.C. issues a monthly publication, *Catholic Action.* (J. LAF.)

Catholic Youth Organization: *see* CATHOLIC ORGANIZATIONS FOR YOUTH.

Catroux, Georges (1879–), French army officer, the son of a general, attended St. Cyr military academy and later served with the Foreign legion. He was appointed aide-de-camp to the governor general of Algeria, 1912, and went to the front in 1914 with the Algerian *tirailleurs.* Wounded and taken prisoner, he made several unsuccessful breaks for freedom, but did not obtain his release until the armistice was signed in 1918. He later became governor general of Damascus, where he served under Gen. Maxime Weygand during the campaign against the Druse tribesmen. Recalled to Morocco in 1926, he was put in charge of intelligence under the command of Gen. Henri Giraud during the Riff rebellion. In 1940, while he was governor general of Indo-China, his refusal to accede to Japanese demands to send troops into Indo-China led to his ouster by the Vichy government. He promptly went to England and joined the Free French. Gen. Charles de Gaulle named him commander in chief of Free French forces in the near east in July 1941. With the formation of the French Committee of National Liberation in June 1943, Catroux became a member of the committee as national commissioner without portfolio. In Nov. 1943 a crisis in Lebanon was precipitated when several Lebanese leaders were imprisoned for attempting to alter their constitution without the consent of the French. Catroux restored order by releasing the prisoners.

Cattani, Federico (1856–1943), Italian cardinal, was born April 17 in Marradi, Italy. He was ordained at the age of 23, served as vicar general in a diocese of his native province and was later called to Rome as counsellor to the Sacred Congregation of Sacraments. He became auditor of the Rota in 1909, later secretary of the supreme tribunal of the Segnatura, from which post he was elevated to cardinal deacon in 1935 by the late Pope Pius XI. He died in Rome, April 12, the third member of the sacred college to die within a month.

Cattle. The production of cattle and calves reached a new record in 1943 when the total number was 78,170,000 head as estimated by the United States department of agriculture. This compared to 75,162,000 head a year earlier and a 10-year average of 68,418.000 head for the period 1932–41. This record exceeded the previous high total in 1918 by over 5,000,000 head and the peak of 1934 by nearly 4,000,000 head. Compared with a year earlier there was an increase of nearly 1,000,000 head of dairy cattle, cows, heifers and heifer calves. The number of cattle being fed was of record proportions at the beginning of the year, amounting to an increase of 8% in the corn belt alone. Fewer cattle were on feed in the western states except California. During the early part of 1943 the federally inspected slaughter of cattle was much below the same period in 1942, amounting to 15% in the first 7 months. A much larger proportion of the cattle apparently went to non-inspected slaughter. Total slaughter was estimated at 28,300,000 head for 1943 compared to 27,100,000 head in 1942. This left an estimated total at the end of the year of 80,800,000 head of all cattle. The calf crop was estimated at 33,700,000 compared to 32,700,000 in 1942. The movement of cattle into corn belt feed lots was less than a year earlier, reflecting the influence of shorter supplies of feed and higher prices. Cattle feeding operations outside the corn belt were reported to be the smallest in five years. Since the numbers of cattle were at such high levels as to be excessive in relation to the feed and pasture resources of the country the War Food administration recommended that the goal for 1944 be set for a volume of slaughter about 19% larger than in 1943, which would decrease the total number of cattle on farms but not jeopardize a safe level of production. The production of beef in 1943 was estimated to be about 9,000,000,000 lb. or 325,000,000 lb. more than in 1942, and veal about 1,000,000,000 lb. or 62,000,000 lb. less than the previous year. The total requirements of beef and veal were estimated to be 11,280,000,000 lb. for 1944, about 10% more than was slaughtered in 1943. (*See* also LIVESTOCK.)

(J. C. Ms.)

Cazalet, Victor Alexander (1896–1943), British M.P., was born Dec. 27 and educated at Eton and Christ Church, Oxford. He served in World War I and won the military cross for gallantry. After the war he attended the Versailles conference and was a member of the British staff in Siberia, 1918–19. In addition to serving as Unionist M.P. from Chippenham, 1924–43, he had been parliamentary private secretary to the president of the board of trade. An authority on central European affairs, Col. Cazalet was appointed in 1940 as liaison officer to Gen. Sikorski, premier of the Polish government-in-exile. He was killed July 4 in the

crash of a plane that was carrying Sikorski and his party back to England from a visit to Cairo.

Cement. The war program, with its extensive military, industrial and housing construction, greatly increased the demand for cement, so that production increased 6% over the preceding year in 1940, 26% in 1941 and 11% in 1942, when the output included 182,781,184 bbl. of portland cement and 2,560,425 bbl. of special cements, a total of 185,341,609 bbl. Even with this heavy increase in output, demand continued to lead, and shipments for 1942 were 187,809,208 bbl. Consequently at the end of 1942 stocks had declined 14% to 21,206,022 bbl. (including 17,445,220 bbl. of finished cement, 3,509,336 bbl. of clinker and 251,466 bbl. of special cements) as compared with 24,738,811 bbl. in 1941. There was sufficient surplus capacity in the industry to cover any probable increase in demand, since the 166 plants contributing to the 1942 output were worked only at an average of 73.5%.

Normally the distribution of cement is highly seasonal, with shipments usually reaching a peak in midsummer, and a low in midwinter, with the peak as much as two to three times as great as the low. Because of the pressure for rapid completion of the work that characterized recent expansions in building construction, winter construction was increased, the low of Feb. 1942 being 8,293,000 bbl., as compared with 3,893,000 bbl. in Jan. 1940. The demand for speed in construction also manifested itself in the proportion of high-early-strength cement turned out, this type having increased by 39% in 1941 and 15% in 1942, with shipments of 7,065,700 bbl. (*See* also GYPSUM.) (G. A. Ro.)

Censorship. Starting to build from the ground floor in Dec. 1941, a comprehensive censorship organization was created in the first twelve months after Pearl Harbor. Thereafter, the Office of Censorship, with a staff of about 13,000, continued to hold major responsibility, acting as an independent war agency responsible only to the president and in no way involved in the series of consolidations and reorganizations which so greatly changed the alignment of official Washington. For the fiscal year 1944, beginning July 1, 1943, congress without debate approved for the agency an appropriation of $27,809,000.

In 1943, the main problems of the office concerned improvement of technique, attainment of more efficient administration and efforts to make certain that increasing advantage was taken of the affirmative benefits flowing from the censoring process.

The purpose of censorship is to prevent important information from reaching the enemy, to attack the enemy's communications and to intercept all possible information regarding his plans. To attain those ends, the Office of Censorship was directed mainly along two lines: first, the censorship of all communications coming into or going out of the United States by mail, cable, radio or any other means; second, the supervision of a method of voluntary co-operation on the part of newspapers, magazines and other publications and radio stations in the United States to withhold from domestic circulation secret military information that might be of value to the enemy.

Control of the international mails, authorized by congress in the First War Powers act, was by far the largest physical task of the Office of Censorship. About 1,000,000 pieces of mail became available for examination daily at various Postal Censorship stations scattered about the rim of the country and at strategic points in the territories. Uniform treatment of these communications was essential, and schools of instruction were maintained for the constant training of personnel in the detailed regulations for handling international mail.

Further, to co-ordinate all censorship in this field, the various regulations drawn up in 1942 for postal, cable and radiotelephone communications were consolidated on Jan. 30, 1943, into a single handbook, entitled *U.S. Censorship Regulations*. The regulations prohibited all communication with enemy territory except by special license and gave notice that revealing references to such subjects as fortifications, ship and troop movements and secret military plans or weapons would be stricken out of all communications sent across the international boundaries. Copies of this handbook were made available to the public for guidance in writing letters, etc., to be sent abroad.

Nevertheless, it was necessary to establish a number of units for handling specialized communications. One such specially trained unit was created to handle letters going to and from prisoners of war, as provided by the Geneva convention. Another group of experts was set up to supervise censoring of trade, banking and shipping communications going out of or coming into the United States. Still another special unit dealt only with philatelic mail under instructions to prevent transmission of code messages or illegal transfer of funds in connection with shipments of stamps across international boundaries.

Batteries of translators also were created to make available language experts able to read some 200 different languages and dialects. Chemists were installed in laboratories at various stations to deal with secret ink messages. They worked in closest liaison with the intelligence agencies. In co-operation with the Bureau of Customs, units were established to examine all papers carried by international travellers at ports of entry and exit and to scrutinize all photographic prints and films, including motion pictures, which were presented for export or import. The Office of Censorship, however, did not examine mail to and from army and navy personnel overseas. That function was exercised by the armed services themselves.

Censorship of high speed news dispatches and other communications by cable, radio, telegraph, radiotelephone and land wire obviously involved a still greater degree of security. In addition, there was the desire for rapid handling of such communications in order to impose the least possible delay. A period of 24 hr. would be considered normal for handling of a letter through censorship, but in regard to high speed transmission of messages it was desired to reduce the censorship delay to a few minutes wherever possible and in many instances to less than a minute. In large part, this was achieved.

Highly expert staffs were on duty at the Cable Censorship stations 24 hr. a day. Extensive files of previous traffic and other pertinent information were kept readily accessible. As in postal censorship, specialists were assigned to the various classes of traffic. The handling of press dispatches alone, for instance, required the services of a sizeable staff recruited from the ranks of experienced newspapermen. It was against this particular operation that one of the few public criticisms of censorship in 1943 was directed. A number of British correspondents protested on several occasions, declaring that deletions from their dispatches, sent from New York to London, sometimes went beyond the requirements of security.

Toward the end of 1942, a minor controversy had arisen in congress over the application of censorship to communications between the continental United States and the territories. Some senators contended that there was no legal warrant for such censorship. At one time, legislation was proposed to legalize

this operation specifically, but this proposal was not revived when the new congress met in Jan. 1943, and the controversy died out. Censorship of communications between the mainland and the territories continued.

Inside the United States, voluntary censorship of the press and of broadcasting continued under the supervision of the Office of Censorship and with the solid support of both industries. On Feb. 1, 1943, the Code of Wartime Practices for the American Press, and its companion piece, the Code of Wartime Practices for American Broadcasters, were revised. Some provisions were eliminated and others added, as dictated by experience. Another revision, relaxing the code, came in the closing months of the year because of an improved military situation and other factors. More complete weather reports were approved for newspapers. Weather news was broadcast by radio stations for the first time in almost two years. Virtually all remaining restrictions on information regarding war production, except in regard to secret models, were eliminated. The way was opened for greater publicity regarding the contribution of merchant shipping toward victory.

Both the Press and Broadcasting divisions, with very small staffs and no branch offices, continued to operate on the theory that every editor and broadcaster was his own censor and that the codes were his guide in hour-to-hour handling of the news. The percentage of violations was strikingly small. (*See* also NEWSPAPERS AND MAGAZINES; RADIO.) (B. PR.)

Census, 1940.

The 1940 census of population in the United States covered a decidedly wider field than any earlier census. In spite of delays inevitably resulting from war conditions, reports were finally published in 1943 on many new topics, including the data on housing derived from the separate housing schedule, data on migration between 1935 and 1940, and data on families and fertility, these last mainly from sample tabulations. Departures in the way of geographic areas represented included selected housing data by city blocks, many tabulations for metropolitan districts (providing information heretofore available only for the central cities), and additional data for counties, townships and the smaller incorporated places. Persons who use in conjunction statistics from any of the reports based on a sample tabulation and statistics from the complete tabulation, will find slight differences in most of the items common to the two sources. The differences are in practically all cases too small, however, to detract from the usefulness of the data. The characteristics of each of the samples are discussed in the report presenting the data.

A selection from among the more significant of the published items is presented in the paragraphs that follow.

Growth of Total Population.—Estimates of the population of the United States as a whole have been made month by month on the basis of current records of births and deaths (corrected for under-registration) and net immigration. These estimates, which are presented in Table I, make no allowance for postcensal movement of the armed forces away from continental United States. That is, they represent the *de jure* population, including men in military service abroad. (The estimates are presented to the last digit as computed instead of being rounded, not because they are assumed to be accurate to the last digit but for convenience in summation.)

The population of continental United States on Jan. 1, 1943, according to the estimates, was 135,645,969, which represents an increase of 1,692,744 over the population estimated for Jan. 1, 1942. The increase during the calendar year 1942 was thus almost twice as great as the average annual increase between 1930 and 1940. The rate of increase for 1942 was 1.3%, as compared with an average annual rate of 0.7% for the decade 1930 to 1940.

This recent acceleration of population growth results mainly from a very considerable rise in the birth rate. During the calendar year 1942 there were approximately 3,038,000 births, as compared with 2,717,000 births in 1941 and with an annual average of not quite 2,400,000 between 1930 and 1940. This increase in the birth rate has taken place since 1936, following an almost continuous decline since 1921, and is attributable mainly, in the first place, to the business prosperity induced by defense activities and, in the second place, to the anticipation of conscription and the entry of the United States into the war. A record marriage rate led to more first births and the number of children born to couples married earlier also increased. The number of deaths in 1942, however, was about the same as the annual average during the decade 1930 to 1940, the death rate in 1942 (based on registered deaths) being only 10.4, which is the lowest on record.

Net civilian immigration during 1942 amounted to 88,587, as compared with 41,162 in 1941 and with an average net emigration of about 5,000 per year during the preceding census period.

The number of births in the year 1943 seemed likely, on the basis of incomplete returns, to exceed very materially the number recorded in 1942. The numbers registered month by month for the first eight or nine months of the year exceeded the numbers registered during the corresponding months of 1942. The excess has been growing less, however, for several months and the number returned for October, the last month for which even preliminary data are available at this writing (Dec. 1943) is materially less than the number recorded for Oct. 1942. Thus, while the trend in the number of births has continued upward longer than was expected, it seems to have definitely passed the peak and begun a decline. The civilian death rate will probably not increase appreciably in 1944, but military mortality is likely to become a much more important factor. The rate of population growth is expected therefore to decline rather sharply as World War II continues.

Estimates of civilian population have been made for states and counties, on the basis of registrations for the various war ration books. The last of these estimates, based on the registration for war ration book 4, as of Nov. 1, 1943, distributes by states and counties an estimated total civilian population of about 127,261,000. It may be noted that this figure is less by 4,408,000, or 3.3%, than the total population returned in the 1940 census (which was 131,669,275). This means that inductions into military service have by so much exceeded the sum of natural increase and net immigration.

Table I.—*Estimated Population of Continental United States, by Six-Month Periods: July 1, 1940, to Jan. 1, 1943*

5 or more	958,918	1.1	941,773	17,145
Not reported	1,129,301	—	993,569	135,732
Median years of school completed	8.8	—	8.9	6.0

attainment of the population is represented by the data on last (or highest) full grade of school completed, or, to use a somewhat more convenient expression, the number of years of school completed. The question on number of years of school completed was included in the 1940 census in place of the less comprehensive questions on illiteracy asked in previous censuses. The data for persons 20 years old and over, a group made up, for the most part, of persons whose formal education had been completed, are summarized in Table II.

Of the whole number of these persons who reported the amount of schooling they had completed, 2,902,284, or 3.4%, had never completed so much as one year of formal schooling, and an additional 4.7% had completed less than four years; 22,521,962, or 26.4%, had completed the eighth grade only; 14,218,084, or 16.7%, had completed four years of high school and an additional 16.3% had had one, two or three years of high school; 3,792,277, or 4.4%, had completed four years (or more) in college and an additional 6.0% had had one, two or three years of college.

Figures representing the median number of years of school completed by various classes in the population are presented in Table III. The median is usually defined as that value, in a series of values arranged in ascending or descending order, which stands in the middle of the series, so that one-half of the items are greater than the median and one-half less. In order to understand clearly the relation between the frequency distribution presented in Table II and the medians presented in Table III, it is necessary to keep in mind the fact that the distribution is in terms of completed years, while the medians are expressed in decimals representing tenths of a year. For example, the number of persons shown as having completed 8 years of school includes not only those who have completed exactly 8 years but also all those who have completed in addition any fraction of a year. In other words, the range of the group is from 8 to 8.9 years. A median of 8.4, then, does not indicate a point beyond the limits of the 8-year group but rather a position within that group.

The median number of years of school completed by all persons 20 years old and over in the United States in 1940 was 8.8. Because of the more favourable educational opportunities in recent years there is a marked relationship between age and the amount of education, the educational attainment being progressively higher for the younger age groups. Thus, for the total population 20 to 24 years of age the median number of years of school completed was 11.2 (representing a position in the early part of the third year of high school), while the median for persons 40 to 44 years old was only 8.6 years and for those 75 and over, 8.0 years. The medians for rural-farm areas are somewhat lower, age by age, than those for urban areas; and the medians for the nonwhite are decidedly lower than those for the white population.

Relative Ages of Husbands and Wives.—Of the 35,087,440 families in the United States in 1940, 26,605,800 were what has been termed normal families, that is, families including a husband and wife, with or without children. Among the tabulations made for these normal families was one showing the age of husband in combination with the age of wife. These figures are summarized for the United States in Table IV. (Because of mechanical limitations, the age of husband was tabulated in somewhat less detail than the age of wife, so that for comparison with the three columns representing husband's age from 35 to 64 it is necessary in each case to combine two lines to obtain the number of wives in the corresponding age group.)

On the basis of the figures in Table IV, two observations may be made: First, that in relatively few cases did the age of the wife materially exceed the age of the husband. About 9% of the wives of husbands under 25 years of age were returned as in the next higher age group, that is, 25 to 29 years; this does not necessarily mean, however, more than a year or two of difference in age. Considerably more than half of the married men under 25 years of age are either 23 or 24 years old, and the wife need be only 25 years old in order to be classified in the next higher age group. Likewise, only 6.7% of the wives of husbands aged 25 to 29 were 30 to 34 years old, and only 5.8% of the wives with husbands aged 30 to 34 were 35 to 39 years old.

The second observation is to the effect that a very large percentage of the wives were considerably younger than their husbands. For example, 44.5% of the wives with husbands 25 to 29 were under 25, and 53.1% of the wives with husbands 30 to 34 years old were under 30. In general, as the age of husbands increases, the proportion of wives who are considerably younger than their husbands also increases, mainly because of the tendency among men who marry late in life to choose wives considerably younger than themselves.

Relationship to Head of Household.—The term "private household," as used in the 1940 census, is defined as a group of persons including the head of the household, persons related to the head, and the unrelated lodgers, servants and hired hands, if any, who live in the same dwelling unit and share common household arrangements. The number of heads of private households is the same as the number of private households and is directly comparable with the number of private families. The number of private households in 1940 was 34,948,666, and the number of persons living in these private households was 128,427,069.

Table III.—*Median Years of School Completed by Persons 20 Years Old and Over, by Age, for the United States, by Colour and by Sex, and for Urban and Rural Areas: 1940*

65 and over	5.4	0.3	0.2	0.2	0.3	0.1	3.6	49.5

In addition to the private households, there were 80,122 quasi households (large lodging houses, hotels for transients, institutions, etc.) with 3,242,206 persons residing in them. The average number of persons per quasi household was 40.5, as compared with an average of 3.7 for private households.

The classification of the population in private households by relationship to head is shown in Table V. The first six classes, head, wife, child, grandchild, parent, and other relative, represent the population in private families. The two remaining categories, representing an aggregate of 5,496,378 people, represent the unrelated persons living in the private households, being mainly lodgers.

On the basis of the sex distribution, it may be noted that the heads of the families were dominantly male and that both the persons living outside private households and the lodgers living in such households showed a considerable excess of males, while the parents and the servants living in the households were largely females.

Table V.—*Population in Private Households, by Relationship to Head, and Sex, and Population Outside Private Households, by Sex, for the United States: 1940*

Relationship to head	Total		Male		Female		Males per 100 females
	Number	Per cent	Number	Per cent	Number	Per cent

Migration, 1935–40.—Among the new questions on the 1940 population schedule was one asking for the place of residence on April 1, 1935, of each person 5 years old and over, designed to give direct statistics on migration from one part of the United States to another. In the tabulations based on this question, migrants are defined as persons whose 1935 residence and 1940 residence were in different counties or who had moved to or from a city of 100,000 or more within the same county. Nonmigrants are persons who lived in the same county or city in 1935 and 1940 or in that portion of the same county outside a city of 100,000 or more.

In Table VI are presented migration data for heads of families which indicate for the migrants the movement between designated urban and rural areas. Of the whole number of families (heads of families) 87.0% were classified as nonmigrants, including 42.7% who in 1935 lived in the same house as in 1940 and 44.4% who lived in a different house but in the same county or city. The migrant families comprised 12.5% of the total, and for 0.4% migration status was not reported.

Of the 2,382,600 migrant families resident in urban places in 1940, 1,612,920 came from other urban places (that is, lived in other urban places in 1935), 399,260 came from rural-nonfarm areas, and 188,540 from rural-farm areas. The figures therefore indicate for the period 1935 to 1940 a relatively small migration of families (family heads) from farms to cities.

Of the 1,227,540 migrant families living in rural-nonfarm areas in 1940, 646,060 came from urban places, 323,620 from rural-nonfarm areas in other counties, and 168,820 from rural-farm areas.

Of the 766,260 migrant families living in rural-farm areas in 1940, 195,300 (or a little more than the number of farm-city migrant families) came from urban places, 90,680 came from rural-nonfarm areas, and 408,280 from rural-farm areas in other counties.

Fertility.—The reports of the 1940 census contained the first statistics on the number of children ever born that the bureau of the census had ever published, though questions on this point were contained in the census schedules in 1890, 1900 and 1910 as well as in 1940. In the classification of women by number of children ever born, all children ever born alive to a woman dur-

Table VI.—*Migration Status and 1935 Residence of Heads of Families, for the United States, Urban and Rural: 1940*

(Figures based on a sample tabulation)

Status and 1935 residence	Total, 1940		Urban, 1940	Rural-nonfarm, 1940	Rural-farm, 1940
	Number	Per cent			
All heads of families	35,088,840*	100.0	20,735,200	7,211,120	7,142,520
Nonmigrant	30,555,400	87.0	18,271,700	5,944,940	6,338,760
1935 residence in—					
Same house as in 1940	14,980,780	42.7	8,086,020	3,048,460	3,846,300
Different house (same county or city)	15,574,620	44.4	10,185,680	2,896,480	2,492,460
Migrant	4,376,400	12.5	2,382,600	1,227,540	766,260
From urban places:					
Total	2,454,280	7.0	1,612,920	646,060	195,300
Places of 100,000 or more	1,235,500	3.5	800,640	347,700	87,160
Places of 25,000 to 100,000	410,320	1.2	289,440	91,520	29,360
Places of 10,000 to 25,000	337,280	1.0	230,380	78,880	28,020
Places of less than 10,000	471,180	1.3	292,460	127,960	50,760
From rural areas:					
Total	1,750,460	5.0	646,900	540,200	554,360
Rural-nonfarm	813,560	2.3	399,260	323,620	90,680
Rural-farm	765,640	2.2	188,540	168,820	408,280
Rural, farm residence not reported	171,260	0.5	59,100	56,760	55,400
Urban-rural residence in 1935 not reported	171,660	0.5	122,780	32,280	16,600
Migration status not reported	157,040	0.4	80,900	38,640	37,500

*This figure differs from the corresponding figure presented in Table V because of sampling variation; the difference is, however, less than one-half of 1%.

ing her lifetime were counted, including children by any former marriage. The tabulations now published, including data for 1910 as well as for 1940, are summarized in Table VII.

Table VII.—*Women 15 to 74 Years Old Who Were or Had Been Married, by Number of Children Ever Born, for the United States: 1940 and 1910*
(Statistics based on a sample tabulation)

Number of children ever born	1940		1910	
	Number of women ever married	Per cent	Number of women ever married	Per cent
Total, 15 to 74 years	35,108,480	100.0	20,476,625	100.0
Reporting on children	30,648,780	87.3	18,911,838	92.4
Not reporting	4,459,700	12.7	1,564,787	7.6
Reporting on children	30,648,780	100.0	18,911,838	100.0
No children	6,223,960	20.3	2,570,074	13.6
1 child	6,606,120	21.6	3,187,739	16.9
2 children	5,990,700	19.5	2,964,832	15.7
3 children	3,943,240	12.9	2,338,236	12.4
4 children	2,586,240	8.4	1,857,260	9.8
5 children	1,707,040	5.6	1,451,787	7.7
6 children	1,164,140	3.8	1,173,150	6.2
7 children	779,000	2.5	913,581	4.8
8 children	580,120	1.9	741,884	3.9
9 children	384,860	1.3	558,800	3.0
10 or more	683,360	2.2	1,151,495	6.1

The figures indicate a decidedly lower fertility in 1940 than in 1910. Of the whole number of women 15 to 74 years old who were or had been married, as returned in 1940, 20.3% had never had any children, as compared with 13.6% of the corresponding group in 1910. Only 38.6% of the 1940 group reported 3 or more children, as compared with 53.9% of the 1910 group; and at the extreme end of the series, only 2.2% of the 1940 group reported 10 or more children, as compared with 6.1% of the 1910 group. To some extent these relations may be affected by differences in age distribution within the group comprising all ever-married women 15 to 74 years old. A more detailed tabulation providing data for women classified by age, however, shows the same relations, namely, a decidedly lower fertility for corresponding age groups in the more recent year. Of the women 50 to 54 years old, for example, in 1940, 15.2% reported no children ever born and 3.6% reported 10 or more, as compared with 8.9% reporting no children in 1910 and 12.3% reporting 10 or more.

Total Value and Rent of Dwelling Units.—One of the most interesting and useful of the tabulations of the 1940 housing census was one in which owner-occupied dwelling units were classified by value, and tenant-occupied units by monthly rent. On the basis of these classifications, total values (of all dwelling units including tenant-occupied) and total monthly rent (including estimated rent for owner-occupied units) have been computed. A summary of these estimates is presented in Table VIII.

Table VIII.—*Total Monthly Rent and Estimated Value of Dwelling Units: 1940*

Area	Number of dwelling units	Total monthly rent (dollars)	Average rent (dollars)	Total value (dollars)	Average value (dollars)
United States	37,325,470	893,714,031	23.94	95,430,309,530	2,557
Urban	21,016,352	608,301,617	30.02	71,110,307,301	3,290
Rural-nonfarm	8,966,837	148,565,028	18.42	16,267,070,012	2,017
Rural-farm	7,642,281	76,788,276	10.05	8,060,931,017	1,055
Northeastern States	10,312,732	350,051,248	34.00	37,178,172,623	3,605
North Central States	11,597,471	272,829,816	23.52	29,461,289,709	2,540
South	10,876,056	150,288,679	14.65	17,120,913,670	1,574
West	4,539,211	110,045,175	24.44	11,678,033,528	2,573

The total value of all dwelling units in the United States on the basis of these estimates was more than $95,000,000,000, and the average value per unit was $2,557. In making these estimates it was assumed that the value of the tenant-occupied and vacant units was 100 times the monthly rent.

The actual or estimated monthly rent of all dwelling units in the United States in 1940 was nearly $894,000,000 dollars, or an average of $23.94 per unit. The annual total on this basis was something over $10,000,000,000. These figures are based on actual rentals reported for tenant-occupied nonfarm dwelling units, reported estimated rental values for all other dwelling units except owner-occupied farm homes, and monthly rentals for these latter estimated at the rate of 1% of the reported value.

The average value of urban dwelling units was $3,290, as compared with $1,055 for rural-farm units. The relation between urban and rural-farm rentals was practically the same. The average value of all dwelling units in the northeastern states was $3,605, of those in the north central states $2,540, of those in the south $1,574, and of those in the west $2,573, again with similar relations among the average monthly rentals.

Sixteenth Census Reports.—The major part of the material from the 1940 census is published in eight "volumes," most of the volumes containing several parts. Each volume has been made up by consolidating a series of state bulletins (in which form the data were first made public), including in each case a summary for the United States. There are four "volumes" presenting data specifically on population and four "volumes" presenting data on housing. In addition, there were available in 1943 20-odd supplementary reports, for the most part based on sample tabulations, covering subjects as follows:

The Labour Force (six reports), presenting detailed tabulations by occupation, industry, income, and personal and family characteristics
Nativity and Parentage of the White Population (three reports), including country of origin of the foreign stock and mother tongue of the entire population
Families (seven reports), including tenure, rent, family income, type of family, employment status and general characteristics
Education, Occupation, and Household Relationship of Males 18 to 44 Years Old
Characteristics of Persons Not in the Labour Force
Differential Fertility
Institutional Population
Characteristics of the Nonwhite Races
Internal Migration, 1935–40
Comparative Occupation Statistics, 1870–1940

More detailed statistics on educational attainment and relationship to head of household may be found in Volume IV of the reports on population. Additional data on the ages of husbands and wives and related topics appear in the report on Types of Families, and much additional detail on migration, including the numbers of migrants from each state to each other state, appears in the report on Internal Migration.

A circular describing all of the reports of the 1940 census may be obtained upon request from the bureau of the census, Washington 25, D.C. (*See* also ALIENS; BIRTH STATISTICS; HOUSING; IMMIGRATION AND EMIGRATION, U.S.; MARRIAGE AND DIVORCE; WAGES AND HOURS; WEALTH AND INCOME, U.S. DISTRIBUTION OF.) (L. E. T.)

Centennials: *see* CALENDAR, 1944, page xx.

Central America. That portion of the Americas lying between Mexico on the north and Colombia on the south, including the republics of Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua and Panamá, and also the Panama Canal Zone and the colony of British Honduras. The total area is about 222,675 sq.mi. The population approximates 8,500,000, with by far the greater proportion living in the highlands of the western cordillera.

History.—No significant political changes took place in 1943, with the same administrations continuing in power during the off-election year and maintaining their policy of inter-American co-operation.

While shipping definitely improved during the year, shortages still were felt in Central America; lack of goods to be purchased was as serious as shortage of cargo space. Fuel oils continued scarce, and in one part of Honduras gas rationing was reported

unnecessary for a time because of complete lack of gas. This factor, and lack of tires, decreased automobile traffic, including motor bus, by as much as 50%. Unemployment was nowhere reported as serious since export facilities had improved and projects, involving various new agricultural items of strategic significance (abacá, hemp, cinchona, rubber), were getting under way. Inter-American highway construction and work in the Canal Zone likewise absorbed labour.

The United States and Mexico became officially represented by embassies instead of ministries in all the Central American republics, during the year.

Trade and Communication.—Under war conditions detailed trade statistics for the year were not available. Trade of the republics with the United States, for the first nine months of 1943, showed balances favourable to the United States in the cases of Honduras ($644,000) and Panamá ($22,025,000); favourable to the republics in connection with Costa Rica ($143,000), Guatemala ($6,669,000), Nicaragua ($4,801,000) and El Salvador ($9,947,000). Values of exports increased, in proportion to volume.

External communication by sea improved as submarine action diminished, but shipping was still short of normal. Air service continued important. The TACA air line, active in Central America as well as in South America, was purchased by American capital during the year. Construction on the Inter-American pioneer road, completion of which had been scheduled for May 1943, was slowed by supply shortages because of shipping failures, and by construction difficulties caused by prolonged rainfall and the worst terrain south of Alaska. By the end of the year work on the road was reported halted since most goods were now going north by boat. (*See* articles on individual countries and HISPANIC AMERICA AND WORLD WAR II.)

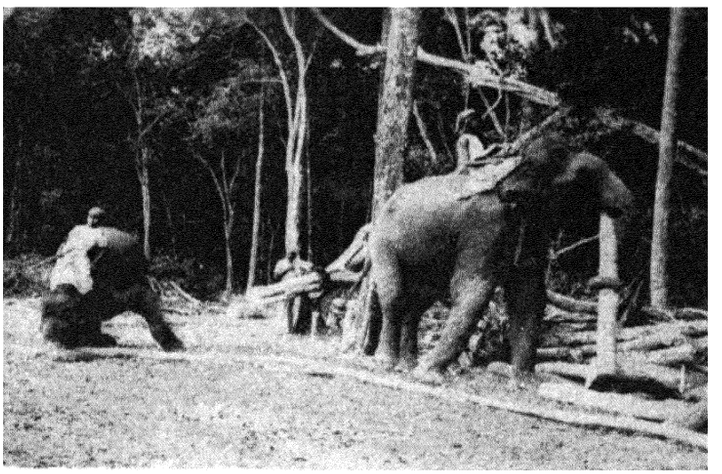
Ceylon.

A British crown colony, lying off the southern extremity of India and approaching within 6° of the equator. Area 25,332 sq.mi.; pop. (est. Dec. 31, 1940) 5,981,000. Chief towns (pop. census 1931): Colombo (cap., 284,155); Jaffna (45,708); Galle (38,424); Kandy (37,147). Governor (1943): Sir Andrew Caldecott; languages, English, Sinhalese, Tamil; religions: Buddhism and Hinduism the chief.

History.—During 1943 Ceylon remained fully mobilized. The population contributed generously to the war effort: £75,000 was donated to war funds, and in a single savings week £2,750,000 was raised. Readers of the *Times* of Ceylon contributed £225,000 to their "send a plane" fund. To render the country self-supporting, rural schools undertook the cultivation of 30,000 ac. of crops.



After the fall of Malaya in 1942, Ceylon became the chief source of natural rubber in the British empire. A "grow more rubber" campaign was inaugurated and 20% of the trees were to be "slaughter tapped."

In order to stimulate social reform, village welfare societies were started in the rural districts. The island was administered by the governor, assisted by three ministers and an elected council of state. But Ceylon had been guaranteed full internal self-government as soon as possible after the war, and the board of ministers was asked to draw up its own schemes.

(H. G. RN.)

Education.—In 1940: Sinhalese and Tamil schools 3,175; scholars, 389,153 boys, 172,448 girls; English and bilingual schools 408; scholars, 71,536 boys, 30,702 girls. Total number of schools: 5,816; scholars 819,297.

Banking and Finance.—Revenue (1941–42) £9,384,400; (est. 1942–43) £11,133,333; expenditure (1941–42) £9,474,876; (est. 1942–43) £12,266,666; public debt (Sept. 30, 1940) £9,408,775 and Rs.45,270,000; currency Rs. 1 = 100 cents = 1*s*.6*d*. (30.3 cents U.S.) in 1943.

TRAINED ELEPHANTS stacking timber in a Ceylon jungle after trees had been cleared for an R.A.F. airfield

Trade and Communication.—Overseas trade, merchandise, 1941: imports Rs.259,510,454; exports (domestic) Rs.264,717,885. Communications and transport 1940: roads, motorable 5,633 mi.; railways (117 mi. narrow gauge) total 960 mi.; shipping, entered 6,489,322 net tons; motor vehicles licensed (Dec. 31, 1941), 20,092 motor cars and taxis; 4,394 trucks and vans; 2,486 omnibuses; 2,644 cycles; 66 tractors; 231 trailers; wireless receiving set licences (Dec. 31, 1940), 9,736; telephone instruments in use (1938), 10,424.

Agriculture.—Production, in metric tons: rice (1938–39) 300,000; copra (including coco-nut oil) (1939) 155,000; tea (1940) exports 112,000; rubber (1940) shipments 90,000.

Chain Stores: *see* BUSINESS REVIEW.

Chambers of Commerce.

The Chamber of Commerce of the United States, with headquarters in Washington, D.C., gave its attention during 1943 primarily to problems connected with the war and the postwar period. Participating in the work of the organization were 1,400 local chambers of commerce, 400 trade associations and an underlying membership of 1,000,000 business firms. Eric A. Johnston, of Spokane, Wash., was elected as president for a second year at the annual meeting in April 1943. Ralph Bradford was general manager.

A program of action for the 1943–44 year has been directed toward three major objectives: (1) Winning the war; (2) preparing for victory, including matters relating to a transition period and postwar reconstruction; and (3) long-range policies in line with the basic purpose to work for the preservation and strengthening of free enterprise and representative democracy.

Among activities in the legislative field were a broad campaign to stimulate businessmen and their organizations to make new contacts with their elected representatives in congress, the enlistment of state chambers in stimulating meetings and other congressional contacts, a wide dissemination of congressional district maps together with letters from divisional vice-presidents urging business participation in legislative affairs, a distribution of a state-by-state breakdown of roll call votes with a letter from President Johnston urging businessmen to know their congressmen, and an outline of chamber policies on taxation and

renegotiation with an appeal to members to make acquaintance with congress.

Activities on postwar problems included a series of booklets sponsored by the chamber's committee on economic policy, a canvass of probable consumer demands after the war, and the promotion of local studies of possible employment conditions during the period of demobilization and reconstruction. The chamber also organized late in the year a special committee on international postwar problems. Through a special committee on international transport, the chamber offered recommendations for the future development of the American merchant marine and commercial aviation.

Channel Islands: *see* BRITISH EMPIRE.

Cheese. Production of cheese in the U.S. continued to decline in 1943 from the high point in 1942. The total production of 1943 was estimated to be 914,000,000 lb. compared to 1,109,000,000 lb. in 1942 and 669,000,000 lb. as the average of 1935–39. This decline in cheese production was attributed to the large demand for fluid milk for consumption and raised the question of the possible control of whole milk late in the year 1943. As the demand for butter increased with the scarcity, many cheese factories shifted to butter making. The rationing of cheese continued through the year but did not operate to check the demand, only the absence of the product in the markets was effective. The estimated per capita consumption of cheese in 1943 was 4.9 lb. compared to 5.6 lb. as the average of 1935–39. (*See* also BUTTER; DAIRYING; MILK.) (J. C. MS.)

Chemical Therapy: *see* CHEMOTHERAPY.

Chemistry. Any list of noteworthy chemical accomplishments of 1943 must include the vast industrial developments occasioned by the war, such as the new plants for the production of synthetic rubber, ammonia, chlorine, magnesium and other necessary commodities. The list should at least give passing mention to the large amount of government-subsidized research (Office of Scientific Research and Development) which cannot be discussed. In the same category is a large portion of privately sponsored research.

Many developments of the year can be mentioned, however, and of these none is more in the public eye than penicillin, a drug with phenomenal curative properties.

Penicillin.—The beneficial effects of certain kinds of bacterial products in combatting disease have long been known. Pasteur showed in 1877 that *Bacillus anthracis,* which causes the disease anthrax, can be repressed by other microorganisms. The French physician Felix Hubert d'Herelle in 1917 expanded the work of a British bacteriologist, F. W. Twort, and developed means of producing an active substance by bacterial growth which he named bacteriophage, a substance of low toxicity and of considerable commercial importance, but with the drawback of being too specific for general use.

It was Alexander Fleming of London, working with cultures of certain strains of staphylococci in 1929, who discovered that a certain green mould was able to destroy the colonies of staphylococcus on an agar plate culture. The green mould was found to be a species of fungus known as *Penicillium notatum.* The filtrates from the cultures of this mould were found to have strong germicidal activity, and Fleming named the material penicillin. Fleming's findings were reinvestigated and expanded in 1940 by an Oxford group of investigators headed by E. P. Abraham, E. Chain and H. W. Florey. Shortly thereafter, Florey visited America to interest the United States government and several commercial laboratories in undertaking the commercial production of penicillin. His mission was successful and the year 1943 witnessed the building of new plants in at least 18 companies interested in this production. The new plant of the Commercial Solvents corporation of Terre Haute, Indiana, was nearly completed in 1943 and was equipped to be the largest producer of penicillin in America.

Of the two experimental approaches for the production of penicillin, namely, the bottle culture of the mould, and the deep culture technique, the second seemed best suited for large-scale production. Most of the smaller producers, however, were employing the bottle method.

Chemical studies showed that the bacteriostatic action of penicillin is not antagonized by pus, blood, hydrolytic products of proteins, or by products of tissue autolysis. After intravenous administration much of the active substance is recoverable in the urine. The material was shown to be particularly effective towards certain infections of the gas gangrene type, osteomyelitis, gonococcal infections, and many other types of infection. Some bacteria, notably *B. coli* and *B. influenzae* are not affected by it.

The structure of penicillin was not known in 1943, but considerable work was done on its chemistry. Penicillin seemed to contain 2 to 4% of nitrogen of a non-protein nature, and the preparations thus far prepared contained a pigment varying in colour from light yellow to dark brown. Possibly the nitrogen content and the pigmentation might be due to impurities. Penicillin is an acid. It is soluble in water and inorganic solvents such as ether, alcohol or acetone. It gives rise to salts such as the sodium, barium, or strontium salt, and also to ethyl, methyl and butyl esters. A methyl ester was prepared by Karl Meyer of Columbia university by the action of the free acid of penicillin and diazomethane. The esters were considerably less potent against haemolytic streptococci than penicillin itself. Work up to the close of 1943 was hindered by lack of an adequate supply of material and by lack of suitable criteria of ultimate purity. Many groups of workers were engaged in elucidating the chemistry of this material and in another 12 months it seemed certain great advances would be seen.

The Penny.—Shortage of materials caused problems in U.S. coinage, both the nickel and the penny having undergone change in alloy content. The traditional penny was made of 95% copper and 5% zinc and tin. During 1943 a zinc-coated steel penny was widely circulated, but it lacked popularity because of its silvery appearance when new.

Scheduled for production on Jan. 1, 1944 was a new copper penny which would contain 85–90% copper, and 10–15% zinc. The material for this new penny would be the small arms cartridge cases recovered from military authorities from proving grounds, firing ranges, and other training areas for troops. These cases contain 70% copper and 30% zinc, to which would be added sufficient copper to bring the content up to the required amount.

Fluorescein.—The organic dye, fluorescein, was given a new use. A quantity of the dye was cemented to an aviator's life jacket with a rip flap, so that if an aviator were forced to land in the ocean he might empty this packet of fluorescein into the ocean, with the result that a wide area of water would be converted into a visible yellow patch. In this way search for lost aviators would be made much easier.

Acrylonitrile.—In 10 years acrylonitrile changed from its status as a rare chemical to one which was produced in large quantities. Its two major uses were in the manufacture of methyl acrylate for the transparent plastic known as Plexiglas and in the production of Buna-N rubber.

Acrylonitrile itself, $CH_2=CHCN$, is made by dehydration of

2-hydroxyethyl cyanide, $HOCH_2CH_2CN$, which in turn is made from ethylene chlorohydrin, $HOCH_2CH_2Cl$, and sodium cyanide.

Its availability made it a logical compound to study, and H. A. Bruson of Rohm and Haas company and C. F. Koelsch of the University of Minnesota discovered that acrylonitrile was reactive toward a variety of compounds if an alkaline catalyst was present, such compounds including acetone and other ketones, ethyl alcohol and other alcohols, nitromethane and other nitroparaffins, and even such substances as indene, cyclopentadiene, oximes, mesityl oxide, malonic ester, and organic cyanides. These reactions all proceed by addition of the substance concerned across the double bond of acrylonitrile. If HX, H_2Y or H_3Z represent the substance, the reaction products, respectively, would have the formulas XCH_2CH_2CN, $Y(CH_2CH_2CN)_2$ and $Z(CH_2CH_2CN)_3$. Nitromethane, H_3CNO_2, for example, gives rise to triscyanoethylnitromethane, $NO_2C(CH_2CH_2CN)_3$. Yields of these preparations were high and usefulness for many of them is assured because of the polyfunctional nature of the substances formed.

Nitroparaffins.—Other experiments with nitroparaffins were reported by Kenneth Johnson and E. F. Degering of Purdue university. They discovered that 80–85% yields of propionaldehyde or butyraldehyde may be formed by adding the sodium salt of 1-nitropropane or 1-nitrobutane to cold, dilute sulphuric acid. Coupling of the nitroparaffins with aromatic diazo compounds produced azo dyes, one such being phenylazonitropropane, $C_6H_5N{=}NC(CH_3)_2NO_2$. Such substances dye wool or silk directly and are applicable to cotton if the coupling is performed on the fabric.

An ingenious method of analysis for mixtures of nitroparaffins by infrared spectroscopy was reported by J. R. Nielsen and D. C. Smith of the University of Oklahoma. The basis of the method was to find, from the spectra of the pure components (nitromethane, nitroethane, 2-nitropropane, 1-nitropropane) a set of wave lengths such that at each wave length only one component shows strong absorption while the others show weak absorption. For the four nitroparaffins mentioned, these bands were located, respectively, at 10.90, 10.06, 11.74, 8.15 microns. Only a few minutes were required for each analysis, and accuracy was within 0.1%. R. B. Barnes and co-workers of the American Cyanamide company have been active in developing infrared spectroscopy as a tool for the analysis and control of synthetic rubber.

Triptane or Trimethylbutane.—Improvement of motor fuel was an outstanding modern achievement of American chemists. The standard by which such fuels were evaluated was 2,2,4-trimethylpentane, an octane which is arbitrarily assigned a value of "100 octane" in the fuel-rating scale. Important milestones in this phase of petroleum technology were thermal cracking or pyrolysis, the use of tetraethyllead, catalytic cracking, and the "alkylation" by gaseous unsaturated hydrocarbons of paraffins such as isobutane or aromatic hydrocarbons such as benzene. The "alkylation" process may be illustrated by the formation of: (a) 2,2-dimethylbutane from ethylene and isobutane at 480° C. and 1,000 lb. per square inch; (b) isopropylbenzene from propylene and benzene, with suitable catalysts; (c) 2,2,3-trimethylpentane from 1-butene and isobutane, in the presence of concentrated sulphuric acid. Substances a, b, and c all were contributing to the relative excellence of aviation gasoline in 1943, since each possessed a rating of 90-98 octane or better.

The newest member of this group was trimethylbutane, $(CH_3)_3CCH(CH_3)_2$, one of the heptanes now marketed as "triptane." Trimethylbutane is not a new chemical. It had been known for years also that it possessed at least a 50% greater power output than 2,2,4-trimethylpentane but until 1943 it had been impossible to acquire any sizeable quantity of it because of prohibitive costs. A new method was announced late in 1943 by V. N. Ipatieff and V. Haensel of the Universal Oil Products company which was claimed to bring its price below one dollar per gallon. This compound would result if propylene "alkylated" isobutane as outlined above. Conditions for this process were not revealed but it was demonstrated that liquid recoveries of over 90% were obtained of which over half is trimethylbutane.

Fluid Catalytic Cracking.—Reference should be made to a new type of powdered catalyst for converting gas-oil into unsaturated gaseous hydrocarbons used by the Standard Oil Company of New Jersey in their plant at Baton Rouge, La. The catalyst is so fine that it behaves like a fluid and the process is referred to as fluid catalytic cracking. Handling a solid in a manner similar to a fluid is a radical departure from previous industrial practice, and increased production of gasoline with less difficulty was achieved in 1943.

Mechanism of Organic Reactions.—In the so-called Arndt-Eistert reaction an organic acid, RCOOH, is converted to a higher acid, RCH_2COOH, by converting the original acid to its acid chloride, RCOCl, and treating the latter with diazomethane. It had been assumed that a ketene, $RCH{=}C{=}O$, is an intermediate in this process, hydration of which produces the final acid. Workers at the University of Minnesota (C. Huggett, R. T. Arnold, T. I. Taylor) demonstrated the essential correctness of this reaction by use of the isotope of carbon of mass 13, since from an original acid which contained 2.51% of C^{13}, the final acid contained 2.53% C^{13}.

Erwin Schwenk and Edith Bloch of Schering corporation (N.J.) made a substantial improvement in the Willgerodt reaction. In this reaction an aromatic ketone, $ArCOCH_3$, is heated under pressure with yellow ammonium sulphide to produce an amide, $ArCH_2CONH_2$. By use of morpholine and sulphur in place of ammonium sulphide the reaction has been carried out effectively without the use of sealed tubes.

The rearrangement of phenyl allyl ether to ortho allylphenol at 200° has been considered to proceed by transfer of the allyl group with an ortho phenol hydrogen. This mechanism was confirmed by use of a deuterium atom in place of the ortho hydrogen atom. In the final product the deuterium was found to be attached to the phenolic oxygen. This work was carried out by G. B. Kistiakowsky and R. L. Tichenor of Harvard university. Additional studies on the rearrangement of more complex allyl ethers were reported by W. N. Lauer, P. A. Saunders and Owen Moe of the University of Minnesota.

The use of diphosgene, CCl_3COCl, in carboxylation reactions was investigated by M. S. Kharasch and co-workers at the University of Chicago. By heating a mixture of diphosgene and diethylacetyl chloride, $Et_2CHCOCl$, for ten hours at 225° C., a 90% yield of diethylmalonyl chloride, $Et_2C(COCl)_2$, was obtained. They found that good yields could be obtained with many disubstituted acetyl chlorides, whereas poor yields were obtained with monosubstituted acetyl chlorides. For example, phenylacetyl chloride, $PhCH_2COCl$, gave rise to only 1.4% yield of phenylmalonyl chloride, $PhCH(COCl)_2$.

Structure of Vinyl Polymers.—Vinyl acetate, vinyl chloride and similar compounds of the structure, $CH_2{=}CHX$, are known to polymerize by opening of the double bond so that a chain of this nature is formed, $-CH_2-CHX-(CH_2-CHX-)_n-CH_2-CHX-$, in which $_n$ represents a large number. The end groups of these long polymer chains are usually not well understood, but the work of C. S. Marvel and G. E. Inskeep of the University of Illinois gave new information on the structure of the end group of polyvinyl alcohol. This polymeric alcohol is produced by alkaline hydrolysis of polyvinyl acetate. During this process

CUTTING A SAMPLE from a cube of synthetic rubber. The first synthetic rubber plants approved by the U.S. government after Pearl Harbor began production in 1943

an irregular change was noted in the molecular weight of the polymer, which was explained by assuming that polyvinyl alcohol has one terminal aldehyde group, the structure of which may be visualized as $-(CH_2-CHOH)_n-CH_2CHO$. Under acid conditions this terminal aldehyde group can react with neighbouring hydroxyl groups, and under alkaline conditions the aldehyde function may condense with a similar function, giving rise to molecules of quite different molecular weight.

Aldol.—Two molecules of acetaldehyde condense in the presence of hydroxide to produce aldol, $CH_3-CHOH-CH_2-CHO$. This is a very old organic reaction, but the instability of aldol has made it difficult to study. Several groups of workers contributed to its understanding during 1943. Edward Connolly of the British Industrial Solvents and L. N. Owen reported data on the molecular weight of aldol in various solvents. Owen proved that the molecular weight increases with time for several hours. R. H. Saunders, M. J. Murray and F. F. Cleveland of the Illinois Institute of Technology, by Raman spectrum methods, showed the absence of an aldehyde group in freshly distilled aldol and suggested as a probable explanation the reaction of aldol with acetaldehyde to produce an unstable cyclic acetal:

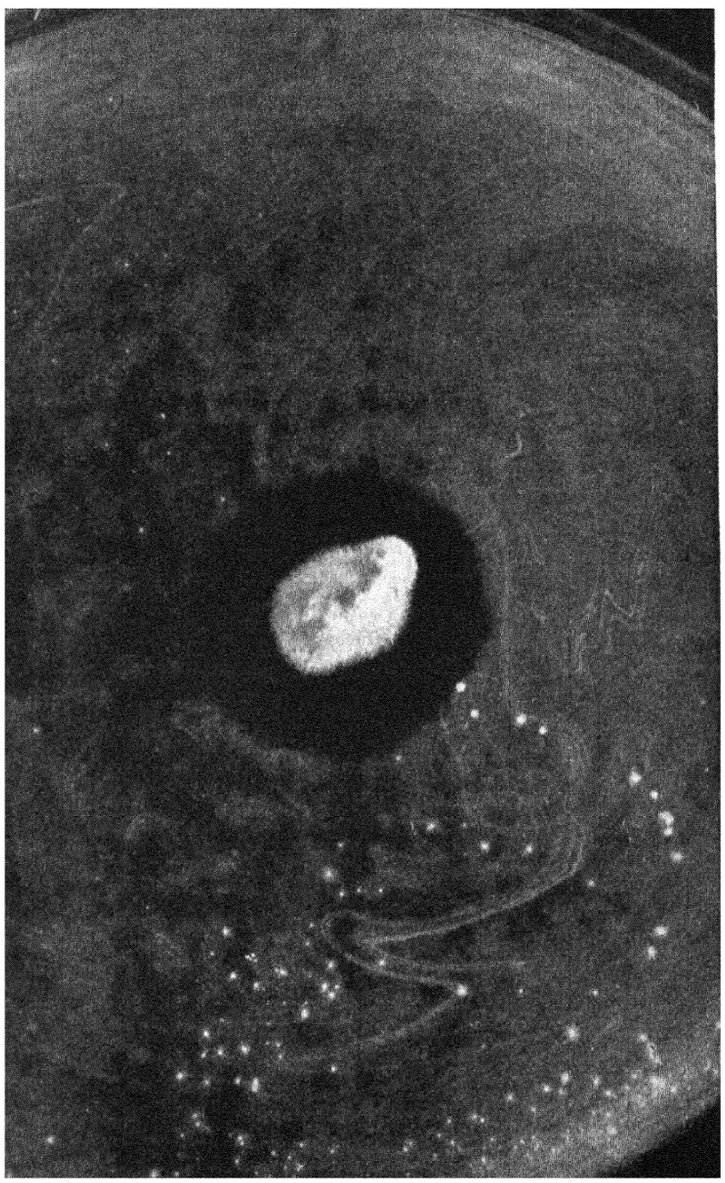
$$CH_3CHOHCH_2CHO+CH_3CHO\rightarrow CH_3CH(O-CH(CH_3)-O)-CH_2-CHOH$$

E. Spaeth and T. Meinhard of Germany proved that aldol could not be converted to a monoacetate by simple methods, but did succeed in preparing it indirectly. The substance which aldol changes to on standing was acetylated with acetic anhydride and pyridine. The resulting product was then decomposed thermally at about 210° C. and 50 mm. pressure to produce the desired acetate of aldol itself.

The Acetone-Formaldehyde Reaction.—Theodore White and R. N. Haward of Colemore Adhesives, England, unravelled part of the complex story that happens when acetone and formaldehyde react. Past workers obtained products which resinified on distillation, but the present investigators found that dilution with butyl phthalate permitted the product to be distilled without resinification, and to give rise to the formation of 4-hydroxy-2-butanone, $CH_3COCH_2CH_2OH$. This substance was obtained in 28% yields by careful distillation and it was found to be fairly stable. If heated with concentrated phosphoric acid it underwent smooth dehydration into vinyl methyl ketone, a low boiling liquid which polymerized to a hard colourless resin. During the polymerization process it contracted 25% in volume, thereby changing in density from 0.84 to 1.12.

Alkaline condensation of formaldehyde with methyl ethyl ketone yielded a similar keto alcohol which, when treated with concentrated sulphuric acid, dehydrated to methyl propenyl ketone. The conversion of the latter to methacrylic acid was accomplished in 41% yield by treatment with sodium hypochlorite. This constitutes a new and interesting synthesis of methacrylic acid, the precursor of the important plastic Lucite.

Analogues of Pantothenic Acid.—Knowledge of the structure of the new vitamin, pantothenic acid, stimulated work on the preparation of compounds of analogous structure to see if they were also growth stimulators when tested on microorganisms. Pantothenic acid itself is made from β-alanine, $NH_2CH_2CH_2COOH$, and 2-hydroxy-3,3-dimethylbutyrolactone, $HOCH-CMe_2-CH_2$ (CO——O). Jean Barnett and F. A. Robinson selected five other lactones, and they also substituted four other amino acids for β-alanine without being able to obtain a product in any case which would replace pantothenic acid as a growth stimulator. These workers, as well as another group of workers headed by R. Kuhn, obtained a reaction product between 2-hydroxy-3,3-dimethylbutyrolactone and taurine, which product was highly inhibitory to *Strep. hemolyticus*. This is the opposite effect to that shown by pantothenic acid. Taurine, $NH_2CH_2CH_2SO_3H$, differs from β-alanine by having a sulphonic acid group in place of a carboxylic acid group. In passing, it may be mentioned that A. A. Goldberg provided a new synthesis of taurine from 2-aminoethanol by conversion of it to 2-aminoethyl hydrogen sulphate, and reaction of the latter with hot aqueous sodium sulphite.



Separation of Rare Earths.—Joseph K. Marsh of Oxford reported that samarium might be separated from its neighbours, gadolinium or neodymium, by treatment of the acetates with sodium amalgam. Of these three elements samarium is the only

one which is readily reduced to the metallic state. In a Sm-Nd mixture it was found possible to reduce the Nd-content from 70% to 0.01% in one step. Another common rare earth mixture which is easily purified by the sodium amalgam technique is that of ytterbium, lutecium and thulium. Only ytterbium acetate in a mixture of these three acetates reacts with sodium amalgam, hence its easy separation.

Traces of europium are often associated with ytterbium, and the work of P. W. Selwood provided a simple method of obtaining the europium content. If these compounds are reduced to the bivalent state, Selwood found that practically complete precipitation of europous sulphate, $EuSO_4$, could be obtained by coprecipitation with barium sulphate, after which the europous sulphate could be removed by washing the precipitate with hot concentrated nitric acid. In this manner pure specimens of europium may be obtained in days rather than years, which were required previously by the tedious fractional crystallizations. (*See* also VITAMINS.) (C. D. HU.)

Chemotherapy. Many of the advances effected in chemotherapy during 1943 resulted from work intended to aid in the prosecution of the war effort by providing better medical treatment at the battle-front and in civilian life and by providing substitutes for scarce medicinal agents. Two of the outstanding advisory organizations that have continued to provide critical examination of the newer medicaments were the council on pharmacy and chemistry of the American Medical association and the division of medical sciences of the National Research council. Another office that was of much aid by providing funds for research was the Office of Scientific Research and Development. The Food and Drug administration contributed by initiating much research in its own laboratories and elsewhere and by enforcing the provisions of the Federal Food, Drug and Cosmetic act. Penicillin was used extensively for experimental purposes in the armed forces and in civilian practice. Because the supply was severely limited, it was allocated in measured amounts only after the case in which it was proposed as treatment was carefully considered by one or more authorities in this field. Even with careful husbanding of the supply, the drug could not be provided for all requests. It seemed unlikely that supplies would be ample for some time, although sufficient might be produced to permit more general distribution for civilian use by the middle of 1944. In 1943 penicillin was still extracted from the mould *Penicillium notatum*. It was believed that when its chemical structure is learned and synthetic manufacture is possible, there would be an unlimited supply.

THE BACTERIA-INHIBITING QUALITIES of penicillin are observable in this photograph of a staphylococcus culture. In the centre of the gray mass of the live culture, the penicillin excreted by the white mould has prevented the growth of staphylococcus colonies in the surrounding black ring

Clinically, penicillin showed much promise in the treatment of osteomyelitis, pneumonia, gonorrhoea, syphilis and other infections. It was effective in infections resistant to the sulfonamides; it showed a low degree of toxicity. Its action was mainly bacteriostatic, occasionally bactericidal, and appeared even when the drug was present in minute dilutions provided the infection was caused by a susceptible organism. Experience during 1943 taught that penicillin must be given in infections such as osteomyelitis over a longer period of time than was formerly believed necessary; otherwise the infection will recur.

Other antibiotics (possibly 30) were investigated but none offered the practical promise of penicillin. One mould extract, patulin, was tried in England as a cure for colds but enthusiasm was short-lived, which meant that the public was yet without a "sure cure" or preventive for colds, vitamins and "cold vaccines" included.

The sulfonamides continued as objects of much investigation, partly for the development of new agents more active, absorbed more evenly and less toxic than the current ones, and partly for the development of ones which might affect tropical diseases. In 1943 malaria and dysentery were the only so-called tropical diseases which were believed to be affected to any degree by a sulfonamide. Included in the newer compounds that achieved clinical recognition were sulfamerazine and sulfapyrazine for pneumonia, etc. and phthalylsulfathiazole for the treatment of dysentery.

Diabetics were assured of one more active drug with certain advantages when globin insulin was made available. This insulin was claimed to produce fewer reactions and have a more even effect on the blood sugar.

Experimentally a vitamin (B_c) contained in a liver extract was found by one group to have a curative effect in the anaemia of chickens. Apparently this work was not repeated by other investigators and any clinical value in treating pernicious anaemia in humans remained to be proved.

Physicians were provided with an agent, thiourea, to treat the distressing forms of acute hyperthyroidism. It might save operating in a number of cases. Unlike hyperthyroidism, cancer remained without any drugs for its eradication; surgery and radium or x-ray radiation were the only means of combating this scourge.

Radioactive metals might in the near future be added to the medical armamentarium. In 1943, however, they were used chiefly in an experimental way, and then more for contributing to the knowledge of metabolism than in the treatment of disease. They provided a means of tracing the passage and storage of drugs and foods in the body.

While not strictly in the field of chemotherapy, mineral oil deserves mention, since its harmful possibilities when added to food were exposed. Of much importance is its interference with the absorption of carotene, the precursor of vitamin A, vitamins A, D and K, calcium and phosphorus. This should serve as ample warning to those who use much mineral oil as a laxative and as a salad dressing.

Another item worthy of mention, although not entirely in the field of chemotherapy, was the injection of local anaesthetics at the base of the spine to permit painless birth.

Although many mixtures were proposed for the treatment of burns, only the simplest agents, such as strips of petrolatum gauze, were favoured. Of course, concurrent treatment with serum, plasma and whole blood remained standard measures. Plasma was available in fluid and dry state, serum as whole serum and a concentrated part of the blood formed from the globulin fractions. This globulin fraction permitted certain emergency treatment with much reduction in bulk, an item of extreme importance in shipping. Other special agents investigated as blood substitutes were isinglass solution and a purified part of the haemoglobin of the blood.

In summary, further substantial inroads were made during 1943 in the treatment of diseases such as pneumonia, meningitis, osteomyelitis, gonorrhoea and syphilis, while afflictions such as cancer and colds remained essentially free of effect by chemotherapeutic agents. In addition to demonstrating the value of penicillin in syphilis, investigators studied further shortening of the treatment period by using excessive heat as an adjunct. Although several investigators claimed that sulfathiazole sprayed in the nose and throat would abate and cure a cold, sore throat and sinus infections, this work remained to be substantiated and in no case could such compounds be used freely by the public. No new practical agents were developed for the treatment of malaria and heart diseases, but globin insulin was accepted for the diabetic. In endocrinology major advances were only in refinements of treatment, although a few modifications, some minor in importance, of the more effective sex hormones were prepared. In this regard, some diabetics (those at the menopause) could be controlled simply with oestrogenic substances, although such cases had to be carefully chosen. No outstanding discoveries were made in vitaminology, although many advances were made in the technique of vitamin therapy. Of interest was evidence which seemed to prove that agents such as calcium pantothenate would not affect gray hair. For that matter, no one agent seemed to be effective unless there was a marked deficiency, of which graying hair was only one sign. (*See* also DENTISTRY; MEDICINE; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.)

(A. E. SH.)

Chemurgy. The industrial uses of vegetable oils were sharply curtailed during 1943. The Food Distribution administration on Nov. 23 issued an order prohibiting the use of cottonseed, peanut, soybean and corn oils in the manufacture of soap, paint, varnish, lacquer, linoleum, oilcloth, printing inks and core oil. The prohibition, established because of the need of these oils in foodstuffs, had been in effect with various modifications through the entire year; the November order merely removed most of the modifications.

The needs of war thus suspended progress in increasing the nonfood consumption of these particular oils. It was estimated that if domestic farmers were able to produce the equivalent of the normal imports of oils and fats, more acres would be required for the purpose than in natural years were devoted to the production of cotton for export. The expansion of industrial uses was considered an important step in encouraging greater vegetable oil production. The latter in turn was viewed as a measure toward eventual alleviation of the long-standing problem of cotton surplus. The progress which was under way would undoubtedly be resumed with the establishment of peace.

Oilseed production in the United States in 1943 compared favourably with the record output of 1942. Soybeans at the end of the year were estimated at 206,000,000 bu., peanuts at 2,680,000 lb., cottonseed at 5,079,000 tons and flaxseed at 51,500,000 bu.

Milkweed floss received official recognition as an important and strategic raw material in the late summer. This came in the form of a series of orders, issued at navy and army request, to government agencies for the accumulation of a 10,000,000 lb. stock pile of the floss. The Commodity Credit corporation was instructed to obtain the floss, at the rate of 1,000,000 lb. in 1943, 3,000,000 lb. in 1944 and 6,000,000 lb. in 1945. This action was taken after exhaustive tests indicated the milkweed material to be superior to kapok for use in life preservers, life rafts and for other purposes. Kapok supplies from the orient were cut off, and those in hand were reported to be deteriorating in quality. The milkweed floss collections had to be made almost entirely from the wild plants, which grow abundantly in several areas, notably the northern lake region.

Government grants were made to enlarge the milkweed floss ginning capacity, already established by Boris Berkman's chemurgic research, at Petoskey, Mich., and also for the further prosecution of research at three different institutions.

The oil from milkweed seed has qualities virtually equivalent to those of soybean oil. The limited supply found a ready market. Other by-products from the plant were under investigation. The Soil Erosion service undertook thorough studies of milkweed as a soil binder, since it had an extensive root system.

Seed stocks of a new variety of corn, generally known as "waxey maize," were built up in 1943 to a point where commercial production was expected to be initiated in 1944. While the commercial varieties of corn were widely used for making cornstarch, none of them produced a starch suitable for certain adhesive uses and other industrial purposes, nor for tapioca. The U.S. source of these special starches was root crops of the tropics. "Waxey maize" has characteristics that enable it to meet these requirements. This might prove to be a second important instance of a crop being bred to meet industrial specifications; this already was done in Mississippi with cotton developed to meet the specifications of motor tire manufacturers.

Both corn and wheat were used in 1943, in unreported but extensive quantities, for the manufacture of alcohol for war purposes. Alcohols were required for butadiene necessary to the synthetic rubber program, for smokeless powder and plastics, for antifreeze solutions and in connection with other spectacular uses which might have important postwar consequences.

The shortages of rotenone, pyrethrum and other organic insecticides were sharply felt by farmers. Rotenone was obtained principally from South American plants, and pyrethrum from Japan and Kenya. They are toxic to insects but may be used without harm to animals or humans. Some relief for this shortage appeared in 1943 with the production of a spray material derived from the leaves and plants of Florida castor beans. The supply was marketed among citrus growers and potato producers. Potato producers took a particular interest in the material when

they found that the substance apparently had a fertilizing as well as an insecticidal effect on their plants. This indication was being studied further in search of explanation.

Nicotine, it should be added, assumed new importance as a spray material in the absence of normal quantities of other substances. Studies were continued looking to a tobacco plant grown solely for this purpose.

Belladonna, digitalis and certain other pharmaceutical plants were produced domestically in the U.S. in 1943 in quantities sufficient for the national demand. This also was true of sage, which for the second year was grown on a large enough scale to meet U.S. needs.

Plans were formulated in late 1943 for a considerable increase in guayule production for rubber. The quayule plant, native to and grown only in the southwest, it was believed, could be grown at costs competitive with other sources of rubber. Research reduced the work necessary and improved the mechanical devices used.

No conclusive announcements appeared during 1943 with reference to expectations from *kok-sagyz*, the Russian dandelion, although experiments with its growth were conducted in most of the states. Another year's studies, at least, were expected before it could be indicated whether the plant might have economic possibilities.

Interest in chemurgy continued to rise, according to the National Farm Chemurgic council (50 West Broad Tower, Columbus, O.), the clearinghouse for information in this field. The demand for information and reports was beyond all previous years.

BIBLIOGRAPHY.—*The Chemurgic Digest*, published by the National Farm Chemurgic council; the *Agricultural Situation*, issued by the department of agriculture. Valuable general information on chemurgy is contained in *Pioneers of Plenty*, by Christy Borth, and in *Science Remakes Our World*, by James Stokley. (W. McM.)

Chennault, Claire L. (1890–), U.S. army air officer, was born Sept. 6 in Commerce, Tex. A school teacher during World War I, young Chennault was called up for service in 1917 and served in the aviation section of the signal reserve corps in the United States. After the war, he became an officer in the army air corps and commanded a pursuit squadron in Hawaii 1923–26. He retired from the army in 1937 and in the same year accepted General Chiang Kai-shek's offer to become aviation adviser to China; he then helped the Chinese to create an air force to fight the invading Japanese. In 1941, he founded the American Volunteer group of the Chinese army—a flying squadron of U.S. volunteer aviators who later became known as the "Flying Tigers." Though seriously hindered by inferior planes, the "Flying Tigers" reflected their superior training under Chennault by repeatedly repulsing Japanese air attacks on the Burma road—then China's lifeline. Chennault was called back to active duty with the U.S. army air force on April 16, 1942. He was promoted to brigadier general and in June 1942 was named commander in chief of the U.S. air task force in China. On July 4, his "Flying Tigers" were disbanded and its members were inducted into the regular U.S. army air corps. In 1943 he was promoted to major general and his force was expanded and reorganized into the 14th U.S. army air force. He returned to the U.S. in May to attend the Roosevelt-Churchill conference in Washington.

Chess. An "off" year in championship chess play, 1943 saw few developments of major tournament importance. With neither the world nor the national championships contested, Dr. Alexander Alekhine continued his rule of globe-wide chess and Samuel Reshevsky carried on as U.S. national champion. Dr. Alekhine, the Franco-Russian master, was reported seriously ill in Europe.

Israel A. Horowitz of New York featured play in the United States by winning the open championship of the U.S. Chess federation and, at the same time, the New York state title. He and Anthony E. Santasiere, also of New York, were unbeaten in the tournament, but the latter lost out by having three draws to Horowitz' two. Their match, the final in the tournament, ended in a draw after 24 moves. In the same tournament, held at Syracuse, G. O. Christenson of Brooklyn was first in the expert's division and Louis Persinger of New York topped Class A.

Dr. Ariel Mengarini of Washington, D.C., succeeded Edward S. Jackson, Jr., as national amateur champion and holder of the Sturgis Stephens trophy. Reuben Fine, also of Washington, retained his national rapid transit championship, with Reshevsky again runner-up. Reshevsky won the metropolitan speed championship.

The United States Chess federation went on record as favourable to a postwar tournament with Russia. The soviet union was reported to have many more players than the United States, but few have competed in international tournaments and, consequently, the strength of Russian chess was relatively unknown. (M. P. W.)

Chiang Kai-shek (1887–), Chinese statesman and soldier, was born Oct. 31 at Feng-hwa, Chekiang. Chiang's popularity continued to grow in 1943 with his determination to resist Japan to the final end and to co-operate with the United Nations to establish a better world order. His power and prestige were further enhanced when he became president of the republic of China on the death of President Lin Sen, Aug. 2, 1943. In recognition of Chiang's brilliant leadership and statesmanship and China's magnificent defense, Chiang was awarded the Grand Cross of the Bath by Great Britain in April 1942, the Grand Cordon of the Aztec Eagle by Mexico on June 29, 1943, and the Legion of Merit in the Order of Commander-in-chief by the United States on July 7, 1943.

Under his heavy burden of responsibility Chiang had grown gray and austere but remained as vibrant and alert as ever. As president of the republic of China, commander in chief of all military forces, Tsung Tsai of the Kuomintang, chairman of the Supreme National Defense council, president of the combined national central banks, chairman of the Central Planning board and president of several educational and cultural institutions, Chiang became the centre of all political groups. Chiang's participation in the Cairo Conference November 22–26, 1943 was a diplomatic triumph for China.

Chiang studied military science in China and Japan from 1906–10 and in the U.S.S.R. in 1923, and became a faithful follower of Sun Yat-sen in 1910. In 1927 Chiang established the National government at Nanking and in 1937 he became the national leader and symbol of China's resistance. On July 7, 1943, the sixth anniversary of China's war of resistance, Chiang, rejoicing over his faith in the democracies and confidence in final victory, expressed the opinion that the time limit of Japan's defeat could not exceed two years.

BIBLIOGRAPHY.—Chiang Kai-shek, *Resistance and Reconstruction* (collected speeches 1937–1943); E. T. Clark, *The Chiangs of China;* R. Berkov, *Strong Man of China;* Hollington Tong, *Chiang Kai-shek.* (H. T. CH.)

Chiang Kai-shek, Madame (SOONG MEI-LING) (1898–), wife of General Chiang Kai-shek, Chinese leader, was born in Shanghai, daughter of Charles Jones Soong of the wealthy Soong family. One of three famous sisters, she was educated in the United States and was graduated from Wellesley college in 1917. Returning to China, she served on the China Labour commission, the first woman ever appointed to this agency. She married Chiang in

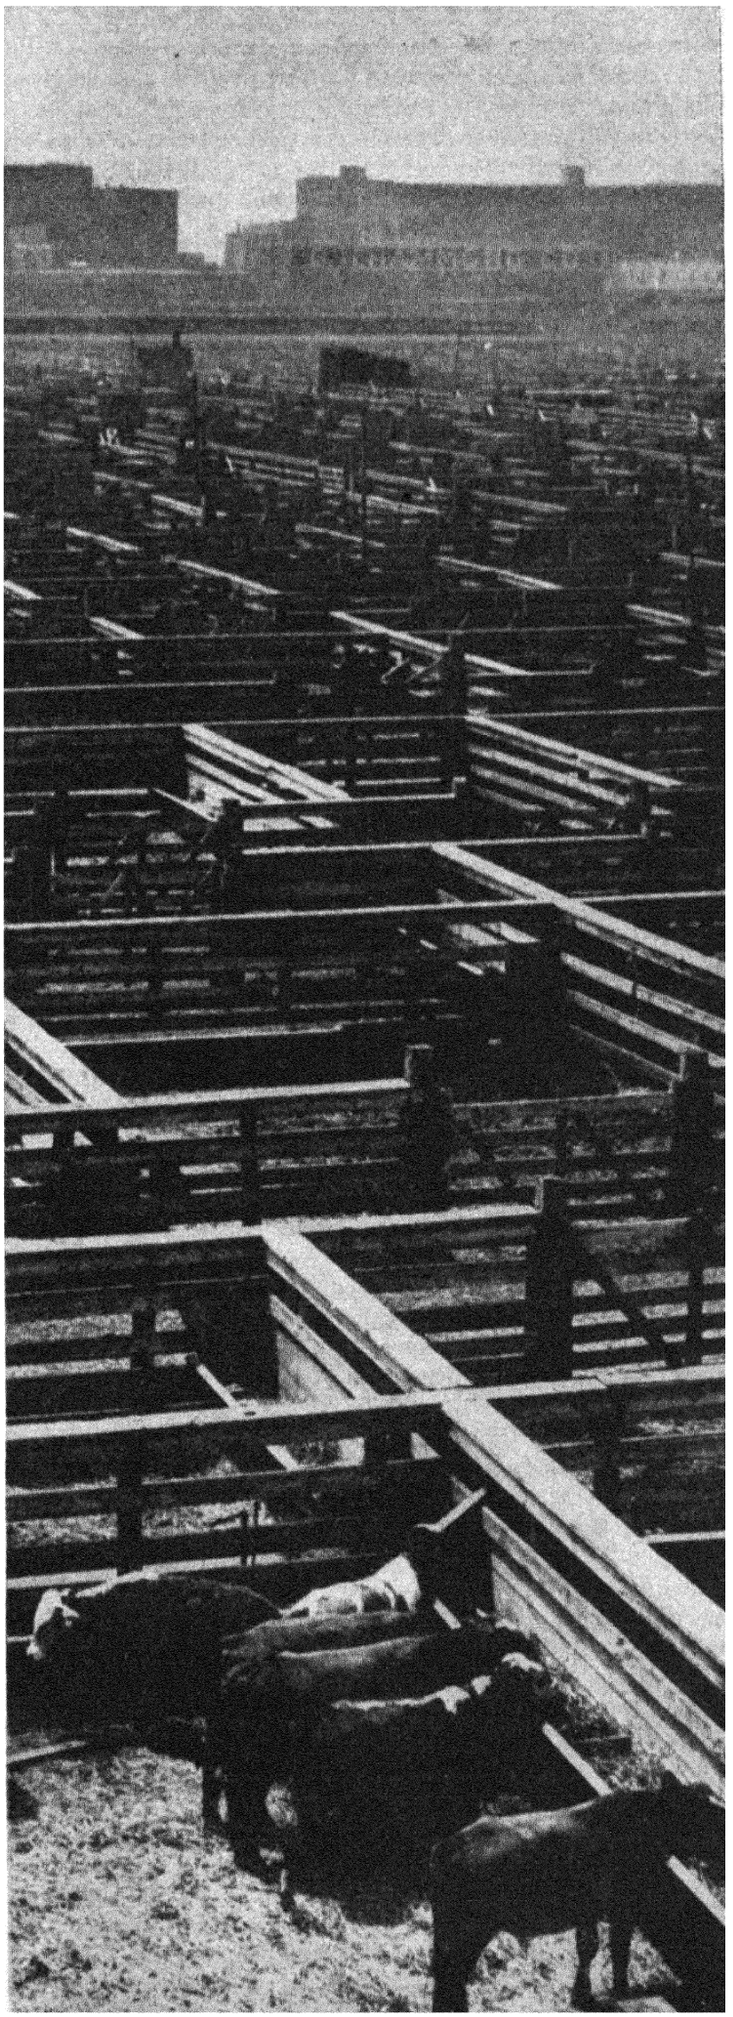
1927. When her husband was kidnapped by Chinese rebels in 1936, she flew to their Sian stronghold, induced them to release Chiang and was instrumental in persuading him to forge a united front with the Chinese communists who wanted to halt Japanese encroachments in China. A strong and vivid personality, Mme. Chiang inspired Chinese fighters, aided thousands of orphans, resettled refugees and established hospitals. In Nov. 1942 she travelled to New York to undergo medical treatment. After three months in a hospital, she visited the White House on Feb. 17, 1943, and addressed the congress on the 18th, being the first private citizen ever to do so. She asked for more help in the Pacific war, pointing out that Japan controlled more resources than Germany. Her travels and addresses in the United States and Canada during the ensuing four months were widely publicized. After a third visit to the White House on June 24, Madame Chiang made a 15,000-mile air trip back to Chungking, via Natal, Brazil, reaching home July 4. In Nov. 1943 she accompanied her husband to Cairo, serving as his interpreter in the conversations there with Churchill and Roosevelt.

Chicago. Second largest U.S. city, a port of entry and the county seat of Cook county, Ill., at the southwest corner of Lake Michigan, Chicago is the largest centre of U.S. rail traffic and of long-distance air routes.

The population of the city proper by the federal census of 1940 was 3,396,808. The white population numbered 3,115,379; non-white, 281,429. The population of the 1,119 sq.mi. comprising the metropolitan district was 4,499,126. The census bureau in 1943 estimated a net decline of 32,113 in the civilian population of the metropolitan area.

The city's birth rate in 1943 continued the rise of 1942 but at a diminished tempo, the increase being 1.6 per 1,000 population in the first six months. Deaths from all causes in the first six months were 19,924 compared with 18,405 for the same period of 1942.

Mayor Edward J. Kelly, Dem., was re-elected for his fourth term, defeating George B. McKibbin, Rep., by a vote of 689,321 to 544,151. Democrats were elected to all minor offices.



Chicago's arms and munitions industry was virtually completed in 1943, when new construction tapered off and production of matériel neared peak proportions. Factory and other industrial additions in 1943 cost $162,239,437, bringing the total of new facilities installed after June 1940 to a value of $980,894,437 in the metropolitan area.

In 1943 Chicago's aluminum industry went into production, and the great Douglas cargo plane plant began delivery of planes. Total annual outlay of the government in the Chicago industrial area for supplies of all sorts was approximately $9,700,000,000, divided largely among 265 new war plants and 1,000 existing establishments expanded for war business. Prime war contracts totalled $5,321,000,000, subcontracts, $2,660,000,000, food for the armed forces, $1,000,000,000 and steel, $742,000,000.

Deep drafts upon the city's manpower brought orders late in 1943 from the War Manpower commission for the establishment of a 48-hour week in many industries. The number of persons on relief rolls dropped from 270,000 in June 1942 to 38,602 at the close of 1943, nearly all unemployables. The city's total relief expense in the seven years ending with 1943 was $185,000,000.

Crimes decreased by 16% in 1943 as compared with the 1942 total. Accidents were reduced by 4,033.

In an attempt to set up a tentative city budget for 1944, the city council in Dec. 1943 wrestled with proposals for drastic

EXCEPT FOR A FEW STEERS, the stockyard pens at Chicago were empty in early July 1943, as the U.S. meat shortage reached a crisis

increases in licence, inspection and permit fees to balance a loss of $2,000,000 in such revenue in 1943 caused by the closing of establishments and also to raise money for $4,500,000 in prospective salary increases. The proposed city budget for 1943 was $160,000,000, compared with $166,138,734 in 1942. At the close of 1943 the city's outstanding bonded debt stood at $65,000,000, compared with the peak of $140,500,000 in 1931, and all maturities of debt on Jan. 1, 1944 were met from funds on hand.

The first unit of the new subway system was opened for operation in October, a 4.73 mi. double track tube, mostly under State street, connecting the north side and south side elevated lines. Total cost of the section placed in operation was $34,119,189. Traffic increase of the elevated lines in the first month's operations after the subway opened was 15.83% over the same month of 1942. (L. H. L.)

Chicago, University of. An institution of higher education and research in Chicago, Ill. Founded in 1891, the university is privately endowed, coeducational, and nonsectarian. In the academic year 1942–43, the university conferred 1,320 degrees, of which 692 were bachelor's (including 42 of the new bachelor's degrees for general education administered in the college), 363 were master's degrees in arts, literature and science, 143 were Ph.D. degrees, and 122 were professional degrees in business administration, divinity, law and medicine.

After exclusion of income from auxiliary enterprises and restricted expendable funds, as well as most of the income received and paid out on contracts (which were nonprofit) with the United States government for war purposes, the total income of the regular budget was $8,113,505, a decrease of $173,487 from the corresponding income for the 1941–42 year. The contracts with the government, for teaching, research, housing and messing, numbering 160, were with 19 different departments, bureaus, or agencies, and resulted in a gross income exceeding $5,000,000. Gifts for all purposes for the year 1942–43 totalled $1,148,550 and endowment funds at the end of the year amounted to $69,423,937. Book value of all university assets as of June 30, 1943, was $125,902,953. (For additional statistics of enrolment, faculty members, endowment, library volumes, etc., see UNIVERSITIES AND COLLEGES.)

Among the important developments of the year was the growth of the first two years of the college, established in 1942, which had a registration of 300 students. The University of Chicago press completed publication of *A Dictionary of American English,* preparation of which began in 1925. The divinity school of the university and three theological schools adjacent to the university and hitherto in loose affiliation with it—the Chicago Theological Seminary (Congregational), Disciples Divinity House and Meadville Theological Seminary (Unitarian)—organized the Federated Theological Faculty. Members of the academic staffs of all four schools form the Federated Faculty, which administers a common curriculum, except for a fraction reserved for denominational education, and degrees will be conferred by the university in co-operation with the schools. The schools retain their full independence.

The university devoted an increasingly large part of its efforts to war research and training during the year 1942–43, both in education and research. The number of civilian students declined to approximately half of normal enrolment, but registration of service students under such programs as meteorology and ASTP offset this decline. In addition to the large number of service students and the navy signal and radio schools on the quadrangles (personnel of which were not enrolled students), 1,629 special students completed noncredit war courses sponsored by the U.S. office of education under the ESMWT programs, and the university's Institute of Military Studies gave basic and specialized military training to 2,550 students, bringing the total so trained since 1940 to 9,500.

Chiefs of Staff, The Combined: *see* COMBINED CHIEFS OF STAFF, THE.

Child Labour: *see* CHILD WELFARE.

Children's Books. More than in 1942, the books of 1943 were influenced by the war, in subject matter, in emphasis, in format and in quantity. The first eleven months of 1942 saw the publication of 831 children's books, while the same period in 1943 listed only 618 books, which resulted on the whole in a somewhat higher quality than in some earlier years. In appearance the books were remarkably attractive considering the restrictions under which they were made, involving narrower margins, poorer paper and greater simplicity of illustration. Many good books went out of print, especially among the less expensive reprints.

A great many books dealt directly with the war or activities which grew out of the war. There was much informational material about the various services, including the WACS and the WAVES, such as Mary Elting and Robert Weaver's *Soldiers, Sailors, Fliers and Marines* and Elizabeth Conger's *American Warplanes* for younger children, and for older boys and girls Keith Ayling's *Semper Fidelis,* Herbert Zim's *Air Navigation,* Kensil Bell's *Always Ready!,* and Douglas Coe's *Road to Alaska,* among many.

Fiction growing out of the war included adventure stories such as Stephen Meader's *The Sea Snake,* stories about children educated in nazi ideology such as Constance Savery's *Enemy Brothers* and Emma Sterne's *Incident in Yorkville,* stories about war industries and about living conditions in congested war industry centres. The number of vocational stories declined, but most of those published had to do with war activities, as Dorothy Deming's *Penny Marsh and Ginger Lee, Wartime Nurses.*

Indirectly connected with the war were the stories about the Allied countries, some just preceding the war, as Dola de Jong's story of Holland, *The Level Land,* and some with a war background, as Mollie Panter-Downes' *Watling Green* (England), Arkady Gaidar's *Timur and His Gang* (Russia) and Eleanor Lattimore's *Peach-blossom* (China).

Non-fiction about other countries increased in quantity and improved in quality with the publication of such books as Cornelia Spencer's *Made in China,* Ellen and Attilio Gatti's *Here is Africa,* Grace Hogarth's *Australia,* Mary Bonner's *Made in Canada,* Eric Kelly's *The Land of the Polish People,* Anne Peck's *The Pageant of Canadian History,* Mary Lucas' *Vast Horizons,* Helen Follett's *Islands on Guard* and Delia Goetz's *Half a Hemisphere,* while the United States and Alaska were well represented in Evelyn Stefansson's *Here Is Alaska,* James Dyett's *From Sea to Shining Sea,* Ann Hark's *The Story of the Pennsylvania Dutch* and May McNeer's *The Story of the Great Plains.*

Geography continued to be published in quantity and included men and women of many countries, times and interests. Nature books worth mentioning were Henry Kane's *The Tale of the Crow,* Jannette Lucas' *First the Flower, then the Fruit* and Dorothy Waugh's *Warm Earth.* Other books of special interest were Helen Dike's *Stories from the Great Metropolitan Operas,* Frank Henius' *Songs and Games of the Americas* and Opal Wheeler's *Sing for Christmas.*

Fiction included many stories of early American history, with emphasis on the fight for liberty and the ideals of democracy, stories of farm and family life which also portray American tra-

dition and ideals, and stories of racial minorities as part of the national entity. Jim Kjelgaard's *Rebel Siege,* Elizabeth Yates's *Patterns on the Wall,* Valenti Angelo's *Look Out Yonder,* John Tunis' *Keystone Kids* and Florence Means's *Teresita of the Valley* were among the many of this group. Eleanor Estes added *Rufus M.* to her stories about the Moffats and Laura Wilder concluded her saga of the Ingalls family with *These Happy Golden Years.*

Other good fiction included Alice Dalgliesh's *The Little Angel,* Oskar Seidlin's *Green Wagons,* Pamela Travers' *Mary Poppins Opens the Door,* Katherine Pollock's *Sly Mongoose,* Patricia Gordon's *The Boy Jones,* Katharine Gibson's *Bow Bells,* Ruth Holberg's *Tibby's Venture,* Gertrude Newman's *Polly Poppingay, Milliner,* Catherine Coblentz's *The Beggars' Penny,* Robert McCloskey's *Homer Price,* Phil Stong's *Missouri Canary.*

Julia Sauer's *Fog Magic* was one of the distinguished imaginative stories of the year. The outstanding collection of folk tales was *The Jack Tales,* compiled by Richard Chase; other good collections were Phyllis Fenner's *Giants and Witches* and Charles Gillham's *Beyond the Clapping Mountains.*

Stories of horses, dogs and other animals were found in abundance, notably Clarence Anderson's *Big Red,* Fairfax Downey's *Dog of War,* and Don Lang's *On the Dark of the Moon.*

The number of picture books was somewhat curtailed but among the best were *Don't Count Your Chicks* by the d'Aulaires, *Katy and the Big Snow* by Virginia Burton, *The 'Round and 'Round Horse* illustrated by Reginald Marsh, and Lee Kingman's *Pierre Pidgeon.* The number of preschool, nursery and toy books was, on the other hand, sharply increased and they were also of better quality than in earlier years.

Several well-known authors wrote outstanding first books for children, among them Esther Forbes, Manning Coles, Alfred Noyes, Antoine de Saint-Exupéry and James Thurber, while Sigrid Undset published her second, *Sigurd and His Brave Companions.*

There were new editions of Andersen's *Fairy Tales,* translated by Jean Hersholt, of Grimm's stories, illustrated by Wanda Gág, and several of selections from the Bible. (*See* also LITERARY PRIZES; PUBLISHING [BOOK].) (S. AN.)

Children's Bureau, United States: *see* CHILD WELFARE.

Child Welfare.

United States.—Although conditions for children in the United States remained highly favourable in comparison with those in countries suffering from invasion, air attack, occupation by enemy forces or widespread famine, many problems of child welfare, especially in relation to emotional and psychological development, were intensified in 1943. In general, existing health and welfare services for children were maintained approximately at existing levels in spite of shortages in medical, nursing and social-service personnel. Progress was made in providing for some of the most pressing wartime needs of mothers and children, such as programs for the prevention and control of juvenile delinquency, care for children of mothers employed in war industries, maternity and infant care for families of enlisted men in the armed forces and safeguards for young workers.

Juvenile Delinquency.—Children and adolescents were quick to feel the excitement and restlessness characteristic of a war period. For boys and girls who had insufficient parental supervision, whose schools were overtaxed or operating on a double shift, who had unaccustomed free time, spending money and little opportunity for wholesome recreation, it was easy to drift into delinquent behaviour. Those who came in conflict with the law represented a small minority even among wartime youth, but they were a minority that caused increasing general concern.

An increase in juvenile delinquency—in the legal sense of an act or conduct that brings a child within the jurisdiction of the juvenile court—under wartime conditions in the United States is indicated clearly by the most comprehensive data available, *i.e.*, statistics reported to the children's bureau of the U.S. department of labour on delinquency cases disposed of by nearly 500 juvenile courts. For 83 of these courts serving areas of 100,000 or more population, a comparison between 1940 and 1942 shows a rise of 16% in delinquency cases in the 2-year period, from 65,000 to about 75,500.

This agrees very closely with the percentage increase shown by courts in 153 areas studied by the National Probation association.

Conditions characteristic of centres of war activity, where rapid influx of population overtaxed housing, schooling, hospital and recreation facilities, were apparently associated with a rise in juvenile delinquency. The percentage increase in delinquency cases disposed of by juvenile courts in areas of expanding population (41 of the 83 courts in the children's bureau series) was twice as great as the increase in cases disposed of by courts in areas of decreasing population.

The children's bureau commission on children in wartime at a meeting at the White House in Feb. 1943 gave special consideration to the problem of juvenile delinquency and recommended that the children's bureau issue a series of publications to aid families and communities in maintaining security in the lives of children and in dealing with behaviour problems.

One of these publications, *Controlling Juvenile Delinquency,* outlines a community program for the prevention and control of delinquency.

In view of the increase in the number of young girls arrested as prostitutes, especially where the May act, prohibiting prostitution in the vicinity of military establishments, was in force, and the high incidence of venereal diseases among these girls, the division of social protection of the Office of Community War Services and the children's bureau began work on plans for strengthening the juvenile services of police departments. At a conference held in Nov. 1943 and attended by members of these agencies and other federal bureaus and national private organizations in the fields of probation, juvenile delinquency, social work and education, the children's bureau was requested to explore the possibilities and to develop emergency and continuing programs for training policemen and policewomen dealing with juveniles.

Social Services for Children.—*Care for Children of Working Mothers.*—The increasing number of employed women with children under 14 (estimated at 5,500,000 in April 1943) was reflected in the growing need for day care and extended school services for children of preschool and school age. State and local committees on child care or on children in wartime, usually associated with defense councils, provided strong citizen leadership in some communities for the development of programs of child care. State and local welfare agencies and private social agencies took the lead in developing advisory and counselling services for mothers and foster-family day-care programs and group-care facilities for children of working mothers, as did state and local education departments in developing extended school services. But with some exceptions the development of child-care programs failed to keep pace with the growing demand for facilities.

The Federal Works agency continued to make funds available to local agencies for the construction and operation of child-care and nursery establishments under the Lanham ("Community Facilities") act. Nearly 2,000 of these units, with an enrolment of approximately 57,500 children, had been placed in operation

by the end of Nov. 1943.

From Aug. 1942 until the end of June 1943, federal funds were available through the Office of Defense Health and Welfare Services from the president's emergency fund for the development of state plans for day care submitted by state welfare agencies and recommended for approval by the children's bureau and state plans for extended school services submitted by state education agencies and recommended for approval by the office of education.

Child-Welfare Services.—Programs for child-welfare services under the Social Security act (title V, part 3), were in operation during 1943 under plans approved by the children's bureau of the U.S. department of labour, in all 48 states, the District of Columbia, Alaska, Hawaii and Puerto Rico. The annual federal appropriation for grants to state welfare agencies administering these programs is $1,510,000. In spite of wartime demands for service, the number of children receiving case-work services under these programs declined from about 50,500 in May 1942 to 41,000 in May 1943, because of the shortage in trained personnel.

Aid to Dependent Children.—State programs for aid to dependent children as provided for in title IV of the Social Security act were in operation under plans approved by the Social Security board of the Federal Security agency in 45 states, the District of Columbia, Alaska and Hawaii, in Oct. 1943. A total of 690,418 children in 278,384 families were receiving allowances at that time; and payments to recipients during October totalled $11,291,506.

Allowances to Servicemen's Dependents.—In Oct. 1943, a liberalization of the benefits provided for in the Servicemen's Dependents Allowance Act of 1942 extended the allowances to apply to dependents of enlisted men in the first through the seventh grades instead of those in the four lowest grades only, and also to apply to dependents of enlisted women. The allowances were increased by increasing the amounts for children contributed by the government. The total allowance for a wife and one child was raised from $62 to $80 a month, and that for each additional child from $10 to $20 a month.

Child Health.—For the first 10 months of 1943 the birth rate was 22.1 per 1,000 estimated population, and the infant mortality rate was slightly under 40 per 1,000 live births, according to provisional figures from the U.S. bureau of the census. The infant mortality rate for each month was lower in 1943 than in 1942, although the rate established in 1942 (40 per 1,000 live births) was lower than that for any previous year on record. The maternal death rate in 1942, 26 per 10,000 live births, was also the lowest on record.

The incidence of the common communicable diseases of childhood, as reported to the U.S. public health service, during the first 6 months of 1943 ran about the same as or lower than during the corresponding period of 1942. During the summer and fall there was a widespread outbreak of poliomyelitis, however, which affected children in nearly every part of the country. The number of poliomyelitis cases reported reached 11,622 by Nov. 13 and exceeded the number reported in any year since 1931. Cases of measles and influenza also were above the median seasonal prevalence during the latter part of the year.

Emergency Maternity and Infant Care.—The outstanding development in the field of child-health services was the program authorized by congress for maternity and infant care for wives and infants of enlisted men in the four lowest pay grades of the armed forces. At the end of 1942, programs of limited extent were in operation in about half of the states; no federal funds had been provided except what could be set aside from the regular children's bureau appropriation for federal grants to states for maternal and child-health services. The first special appropriation for this program, amounting to $1,200,000, became available in March 1943 for the remainder of the fiscal year 1943. For the fiscal year 1944 appropriations amounting to $23,000,000 were authorized by congress for grants to state health agencies for emergency maternity and infant care. By the end of 1943 plans approved by the children's bureau and involving the use of federal funds were in operation in every state and territory except North Dakota and Puerto Rico, and more than 161,000 cases had been approved for care.

Maternal and Child-Health Services.—The maternal and child-health programs provided for under the Social Security act (title V, part 1) continued in operation under plans approved by the children's bureau in all states and territories. The annual appropriation for grants to state health agencies for these services is $5,820,000. Wartime shortages in medical and nursing personnel and in hospital facilities were met so far as possible by reorganizing the programs with emphasis on preventive health measures that would enable available staffs to reach the greatest numbers of mothers and children.

Services for Crippled Children.—The crippled children's programs, for which the children's bureau receives an annual appropriation of $3,870,000 for grants to states under title V, part 2, of the Social Security act, also continued in operation in all states and territories, in spite of the intensification of wartime difficulties occasioned by the withdrawal of surgeons, nurses and physical therapists in large numbers for service with the armed forces, by lack of hospital facilities, by restrictions on transportation and by the scarcity of metal appliances. The number of children on state registers of crippled children on June 30, 1943, was approximately 354,000, an increase of some 13,000 in the course of a year. In Oct. 1943 a national conference on the development of state rheumatic-fever programs was held at the children's bureau. The number of states having programs for children with rheumatic fever included in their services for crippled children had reached 16 by the end of 1943.

School-Lunch Programs.—Lunches designed to maintain children's diets at an adequate level in spite of wartime food shortages and dislocations in home life were made available to some 5,000,000 school children under a new plan put into effect for the school year 1943–44 by the Food Distribution administration, department of agriculture, which was authorized to spend up to $50,000,000 for this purpose. Under this plan local sponsors of school-lunch programs may be reimbursed for the purchase of many nutritious foods up to a specified maximum that varies with the completeness of the meal served.

Child Labour and Youth Employment.—Wartime labour shortages in the United States brought about a large increase during 1942 and 1943 in the employment of boys and girls under 18 years of age—an increase intensified in 1943 with the drafting of 18- and 19-year-old boys into the armed forces.

A fair measure of the trend of employment of young workers in nonagricultural occupations is found in the number of employment or age certificates issued for minors going to work under the child-labour laws of the several states. More than twice as many young persons 14 through 17 years of age were issued certificates for full-time or part-time work in the first 6 months of 1943 as in the first 6 months of 1942; and almost four times as many in the entire year 1942 as in 1940.

The total of young workers 14 through 17 in all types of employment including agriculture reached a peak in July 1943, when an estimated 5,000,000 were at work. In Oct. 1943, after most schools had opened, the number had decreased by about 2,250,000; this left roughly 2,750,000 boys and girls working full-time or part-time—approximately 750,000, 14 and 15 years

of age and 2,000,000, 16 and 17 years of age. In other words, 1 in 6 of the population 14 and 15 years old, and 2 in 5 of the population 16 and 17 years old, were at work. These figures do not include children under 14 years of age, many of whom were known to be employed, the large majority in part-time jobs.

Federal and state agencies dealing with both youth employment and youth welfare problems felt considerable concern because health and accident risks were increasing for these young workers, as a result of new and untried conditions of employment; because thousands of boys and girls were cutting short their normal schooling to go to work; and because other thousands attending school and employed outside school hours, were working too long hours or late at night. At the same time, pressures to relax child-labour and compulsory-school-attendance laws resulted in some lowering of standards through state legislation and administrative action.

The child-labour provisions of the Fair Labor Standards act of 1938, which are enforced by the children's bureau of the U.S. department of labour, helped to protect the youth of the country against these pressures. This act provides a 16-year minimum age for employment of children in or about establishments producing goods for shipment in interstate or foreign commerce, and an 18-year minimum age for work in occupations found and declared by the chief of the children's bureau to be especially hazardous. Employment of children 14 and 15 years of age is permitted only in nonmanufacturing and nonmining occupations, outside school hours and only under conditions not detrimental to their health, schooling or well-being; the occupations and conditions permitted must be determined by the chief of the children's bureau.

The children's bureau developed, for certain industries and processes important to war production, advisory standards to meet the need for new standards for employment of youth in a wide variety of hazardous occupations. These advisory standards suggested the types of work in which minors might suitably be employed as well as those in which they should not be employed. They covered shipbuilding, lead and lead-using industries, employment involving exposure to carbon disulphide, employment involving exposure to chlorinated solvents, welding occupations, operation of metal-working machines and the aircraft industry.

The program of action adopted by the Tenth National Conference on Labor Legislation, called by the secretary of labour in Dec. 1943, emphasized the importance of maintaining legal protections for safeguarding young workers, and not only recommended that plans be made for the revision upward of state child-labour standards as speedily as possible, but urged state labour commissioners and organized labour to give leadership and support to constructive programs for youth that would give full opportunity for the education and training needed to compensate for their premature withdrawal from school and to ensure their rightful place in the postwar world.

Inter-American Activities.—The predominant note in inter-American co-operation for child welfare in 1943 was the enlarging and strengthening of the work of the American International Institute for the Protection of Childhood, with headquarters at Montevideo, Uruguay. The proposals to this end, made by the Eighth Pan American Child Congress in 1942, were considered at a special meeting of the international council of the institute held in May 1943. At this meeting the council approved a resolution asking each government belonging to the institute to appoint as a technical member of the council a person experienced in directing child-welfare work. The council also decided to divide the institute into three departments—child health, education and welfare—as a means toward better co-ordination of the work. A plan for the further organization of these departments was later prepared by a committee and submitted to the members of the council. A technical advisory committee of 5 members was appointed by the council for 2 years to examine and pass on the programs of work presented by the three departments. The council also approved a resolution asking that, for better co-ordination of the work, the American republics be divided into four zones, with a technical member responsible for each zone.

In connection with the program of inter-American co-operation developed by an interdepartmental committee under the department of state of the United States, the children's bureau of the department of labour furnished consultation service on request of the respective governments to official agencies concerned with child health and welfare in Bolivia, Brazil, Chile, Costa Rica, the Dominican Republic, Ecuador, Mexico, Paraguay, Peru and Uruguay. Inter-American scholarships for professional study in fields affecting child welfare, such as public health, pediatrics, orthopedics, nursing, nutrition, social service, child guidance and education, were extended to students from other American re-

CHILDREN PLAYING in the child-care centre of a war plant in Buffalo, N.Y., in 1943 while their mothers are at work in the plant

publics in graduate schools and schools of social work in the United States and in some of these fields scholarships were given to an increasing extent for study in Latin-American countries, notably Argentina, Brazil and Chile.

American Republics.—In Chile services for mothers and children were reorganized and placed under the new national bureau for the protection of children and adolescents. The bureau, in the ministry of health, security and social assistance, has the following divisions: prenatal and maternal care, child health, care of children who are morally or physically neglected, wayward or delinquent, social services and foster-home placement, dental care and central files and co-ordination.

In Mexico the work of the federal department of public welfare and its bureau of child welfare, reorganized in 1942, continued to grow. A committee of physicians was appointed to investigate the activities of the child-health centres and to devise means of improvement.

In Peru the national service for the protection of mothers and children was established by a presidential decree of July 2, 1943. This service, under the national bureau of public health, was placed in charge of health and welfare work for mothers and children done by public and private agencies. The national institute of the child, official agency in charge of maternal and child-health work, and its branch institutes in several parts of the country were placed under the newly established service, which had the director of the institute as its head.

Developments in the field of nutrition included the meeting of the first national congress on nutrition in Havana, Cuba, Sept. 1943, and the establishment of a national institution of the science of nutrition in Mexico for the purpose of studying, among other problems, the state of nutrition of the Mexican people, and the nutritive value of the foods used by them, and participating in the work of other government departments for improving the people's food habits. The council of the American International Institute for the Protection of Childhood gave special attention at its meeting in May 1943 to the report of the nutrition committee and adopted proposals for nutrition studies to be made in several countries and for economic, administrative and educational measures to remedy undernutrition.

A new section to deal with the employment of women and children was established in the newly reorganized national department of labour in Brazil.

New developments in social insurance included a law enacted in Mexico in 1943, effective Jan. 1, 1944. This law, which applies to most employed persons, provides insurance for the contingencies of illness, accident, maternity, involuntary unemployment, invalidity, old age and death. Contributions are required from the insured, the employers and the government. Medical and surgical care, medicines and cash payments are provided for the insured in illness, pregnancy and childbirth. Their dependent wives and children are entitled to medical care and medicines. Emphasis is placed on preventive medical services.

In Panamá the previously enacted social-insurance law was revised by an act to take effect on July 1, 1943. The new act makes insurance compulsory for all public employees and for persons in private employment in specified parts of the country. In sickness the insured persons are to receive medical care at home or in a hospital, and medicine; in case of childbirth an insured woman is entitled to receive, in addition, one-half of her wages for 6 weeks preceding and 6 weeks following confinement.

In Paraguay a decree of April 13, 1943, laid down the principles for the organization of a system of social insurance for all employed persons under 60 years with an income below a specified amount.

National congresses especially devoted to child welfare were held in Peru and El Salvador during 1943. Child welfare also occupied an important place on the agenda of the first national congress of social welfare in Mexico.

Great Britain.—*Child Health.*—In Great Britain health conditions of children reflected the favourable effects of vigorous efforts to strengthen public-health measures and health services for mothers and children, according to the summary report of the ministry of health for the year ended March 31, 1943 (issued in Sept. 1943). Vital statistics for 1942 given in that report showed a live birth rate (15.8 per 1,000 population) higher than in any year since 1931, an infant mortality rate (provisional) of 49 per 1,000 live births compared with 59 in 1941, and a maternal mortality rate of 2.47 per 1,000 live births compared with 2.76 in 1941. The mortality rate for children 1 to 5 years of age continued to improve, being 2% lower than in 1941, and that for children 5 to 15 years of age regained the low level reached in 1939. Deaths from diphtheria reached a new low figure and deaths from tuberculosis, which had increased in 1940 and 1941, fell approximately to the prewar level.

One hundred and five emergency maternity homes with some 2,750 beds available were in operation in March 1943, together with 65 antenatal and 11 postnatal hostels. About 32,000 mothers evacuated from target areas were sent to the maternity homes during the year.

Orange juice and cod-liver oil, free or at low cost, were made available to all expectant mothers and all children under 5 years (previously under 2 years).

Child Welfare and Juvenile Delinquency.—Many additional nurseries for children of women workers were opened by the welfare authorities in Great Britain. At the end of March 1943, more than 1,000 of these were in operation and several hundred more were in preparation.

Because of the special need for its provisions, the British Adoption of Children (Regulation) act, 1939, which had remained inoperative because of the war emergency, was finally put into operation in June 1943. The act extends the existing responsibility of welfare authorities for the supervision of children placed by registered adoption societies to include children placed independently of these agencies.

Juvenile delinquency, which rose in Great Britain in the first two years of the war, began to decline in 1942, according to figures issued in July 1943 by the British Information Services.

Child Labour and Youth Employment.—As in previous war years, imperative production needs in Great Britain called into employment many boys and girls who might otherwise have continued in school beyond the legal school-leaving age (14 years). According to the British Information Services, 77% of the boys and 67% of the girls 14 through 17 years of age were engaged in full-time employment in 1943. Although under emergency orders, as in the past, "permissions" for relaxation of the standards for hours of work laid down in the Factories act were granted for employment of both minors and adults, the report of H. M. chief inspector of factories for the year 1942 (the latest available) stated that the tendency during that year was toward the reduction of the weekly hours, not only of young persons and of women subject to the act, but also of adult male workers.

The direct responsibility of the board of education for Youth Services for boys and girls 14 years of age and over who have left school, dating from the beginning of the war, continued. The Youth Advisory council which in 1942 succeeded the National Youth committee appointed in 1939, and on which are represented social-work agencies, youth-serving organizations, trade unions, the armed forces and organizations that carry on youth activities, gives advisory services to the board of education and offers suggestions on action that should be taken. Compulsory registration of boys and girls 16 and 17 years of age and subsequent interviews with them brought to light information as to how young persons used their leisure hours, the hours of employment, cases of double employment and wages, which became available to the committee.

British Dominions.—In Canada, as in the United States, wartime pressures increased the employment of children. Figures from the province of Quebec, for instance, showed that the number of age certificates issued for boys and girls 14 and 15 years of age going to work increased from 1,667 in the school year 1941-42 to 22,001 in 1942-43. Certain advances in standards, however, were made. In New Brunswick a 14-year minimum age for employment in factories was established for the first time, and in Quebec, the one Canadian province without compulsory-school-attendance requirements, a law was enacted, effective July 1, 1943, requiring children to attend school up to 14 years of age, with certain exemptions limited to a 6-weeks' period.

In New Zealand, which also faced an acute child-labour problem as the result of increasing employment opportunities and the growing shortage of manpower, the minister of education announced that the school-leaving age would be raised to 15 years by the beginning of 1944.

In Australia, the Maternity Allowance Act of 1912, amended in 1942, was again amended in 1943 by abolishing the means test and increasing the lump sum payable on the birth of each child.

Continental Europe.—The ravaging effects of the war on the health of children continued in German-occupied Europe. Malnutrition and undernourishment were widespread. Rickets, scurvy and contagious diseases, especially tuberculosis, diphtheria and malaria, were spreading to an extent considered disastrous, according to information available from Belgium, France, Greece, the Netherlands and parts of Poland. The most recent vital statistics available showed a fall in the birth rate in most of these countries:

in France the number of children born in 1942 was 28% below the 1937 figure; in Greece the number of births per month fell from 1,500 in the prewar period to fewer than 500 in Sept. 1942. In all these countries infant mortality increased.

Where educational systems were not entirely disrupted by the war, large numbers of children were prevented from attending school by lack of shoes and clothing. Because of their deteriorated physical condition, many children who continued to attend school did so irregularly, were unable to concentrate on their studies and sometimes fainted from hunger. The mental and physical development of children and their emotional state were affected by evacuation, deportation, forced labour and other conditions.

In the soviet union a government decree for the expansion of child-health work, dated late in 1942, called for the appointment of a specified number of physicians to the staffs of child-health centres and children's clinics in cities and of public-health nurses in rural districts. Provision was made for the appointment of a qualified pediatrician in each city, industrial settlement and provincial district, to organize and direct the medical treatment and preventive care given in child-health centres, children's clinics and other agencies to children of all ages.

The nation-wide program of compulsory industrial training of young people 14 to 17 years of age, introduced in the soviet union in Oct. 1940, was proceeding without interruption despite the war, according to *Pravda*, official Moscow newspaper. The number of schools providing this training increased from 1,550 at the end of 1940 to 1,700 in Sept. 1943. In that period more than 2,500,000 boys and girls entered these schools; 1,500,000 of them had completed their training by the end of Sept. 1943 and entered various industries.

New legislation on the treatment of juvenile delinquency went into effect in Finland in the beginning of 1943. The new law raised the minimum age of legal responsibility to 15 years (instead of 7 years as formerly), so that children under 15 are not brought before the courts. A special procedure is prescribed for dealing with young persons under 21. Their cases must be studied by the public-welfare agencies prior to a decision by the court. Children under 15 accused of punishable offenses and those between 15 and 18 accused of such offenses, but on whom no court sentence had been imposed, were to be placed in the care of public-welfare agencies. Probation and parole were permitted.

A law for compulsory sickness insurance was enacted in Spain in Dec. 1942. Some parts of the law were to become effective in the middle of 1943; others at the end of 1944. Insurance was to be required for all persons working for a living, whether for an employer or on their own account, with income below a specified amount.

International Co-operation.—Special significance for the children of the world lay in action taken at the United Nations Conference on Food and Agriculture in Hot Springs, Va., in May 1943. Ample evidence was introduced as to the malnutrition of children in many countries and as to the relationship between malnutrition and maternal, infant and childhood mortality. The obligation of governments was clearly recognized to meet the special needs of "vulnerable" groups, including infants, preschool and school children, adolescents, and expectant and nursing mothers.

At the first session of the council of the United Nations Relief and Rehabilitation administration, which met in Atlantic City, N.J. in Nov. 1943, further recognition was given to the needs of these vulnerable groups for medical care and health and welfare services. (K. F. L.)

Chile. A republic on the Pacific coast of South America, extending from approximately 17° S. lat. some 2,800 mi. to Cape Horn. Area: 289,776 sq.mi. Pop. (1940 census) 5,023,539; official estimate 1942 5,122,665; over three-fourths of the population live in Chile's great central valley. The capital is Santiago (1940 pop., 639,546, without inclusion of suburbs). Other important cities (1940 census) are: Valparaíso (215,614); Concepción (92,364); Temuco (84,696); Viña del Mar (70,013); Osorno (62,106); Chillán (61,535); Valdivia (49,481); Puerto Montt (44,024); Talcahuano (41,536); Iquique (39,282); Rancagua (38,423); Linares (36,403); Curicó (35,270); La Serena (35,055); Nueva Imperial (33,361); Magallanes (Punta Arenas) (33,134). There is no established church, although a majority of Chileans are Roman Catholics. The language is Spanish. President in 1943: Juan Antonio Ríos.

History.—The long-expected rupture of Chilean diplomatic relations with the axis powers finally occurred on Jan. 20. The breakdown of Chilean isolation had been slow, and had been controlled by President Ríos until he considered that the proper moment had arrived. At the time of the severing of relations, it was estimated that about 20,000 Germans, 12,000 Italians, and 700 Japanese were resident in Chile. Shortly afterward news that Chilean representatives in Japan were being imprisoned resulted in confinement of Japanese diplomats in Chile. As a result of earlier conferences and of the new status of Chile in inter-American co-operative efforts, a lend-lease pact was signed with the United States on March 2, and in June an important new copper contract was concluded between Chile and the United States Metal Reserves corporation. By the latter, an earlier purchasing agreement was extended through July, 1944, with the prices paid for Chilean copper substantially increased. The United States also agreed to purchase reasonable amounts of gold and manganese to help out Chilean economy, and to aid in shipment of machinery and coal needed in Chilean industry. Chile likewise was represented at the United Nations Food conference held in the United States in May.

In spite of her abandonment of isolation, Chile maintained favourable relationships with Argentina. In April a ten-year contract was signed between the two countries by which Argentina purchased substantial quantities of nitrates. Late in August trade agreements were signed by which tariffs between the two

APPROVAL OF PRESIDENT RIOS' rupture of diplomatic relations with the axis Jan. 20, 1943, was expressed by Chileans with placards, flags and a great public demonstration

countries were greatly reduced, and basic plans for a projected customs union started, with hopes that other nearby states might eventually participate. Plans for improvement of trans-Andean roads were also laid.

The year's record involved much factionalism in Chilean internal politics. In the early months of the year the Socialist party was badly split by a difference of opinion between Marmaduque Grove and Salvador Allende, with the breach not healed until April, when the former became president of the party organization, the latter vice-president. In June Chile's 22 parties found hurried realignments necessary with the official dissolution of the world Communist organization. The Chilean Communist party, the strongest outside of Russia and the fifth strongest group in Chile itself, now attempted the organization of a powerful leftist coalition of the Communist, Socialist, Agrarian, and Socialist-Labour parties. Political manoeuvring so delayed constructive legislation that President Ríos in June formed a cabinet made up of experts rather than political personalities, and conditions caused him to postpone again a projected visit to the United States. The "ministry of experts" was dissolved in August, the administration including two members from the conservative Liberal party in its next cabinet (six of the "technical" ministers were retained).

In October a special session of the legislature was called to consider financial matters; a deficit of above 500,000,000 pesos was in prospect by 1944. Strikes in Chilean industries and ports caused trouble in succeeding weeks, and on November 16 congress finally granted emergency powers to President Ríos in the hope that executive action could improve Chilean conditions.

Various economic problems plagued Chile during 1943. One was a coal shortage; while Chile produces more coal than other South American countries, shipping was not available to move it. Many trains were not able to operate during the Chilean winter because of lack of fuel. High prices affected the volume of retail business, and shortages of some essential items were noticeable. Chilean workers were restive over wage levels which rose more slowly than prices and over the repeal of legislation which had guaranteed the single-shift day. Because of fuel shortages and tire shortages for motor cars of all types, the use of bicycles increased during the year.

Education.—Primary education is free and compulsory. In 1940 primary schools numbered 3,678, with an enrolment of 495,267; there were also 161 night schools with an enrolment of 9,784. Public secondary schools numbered 86, and private, 168, with enrolments of 30,420 and 16,356, respectively. In addition there were many special schools, and three universities had a registration of 7,904 students.

Finance.—The monetary unit of Chile is the peso, with a free value of approximately 3¼ cents U.S. in 1943 (its official value was $.0516, and the export draft price, $.04). Government revenue for 1942 was 2,953,800,000 pesos; expenditures, 3,052,000,000. The 1943 budget calculated ordinary revenue at 3,185,700,000 pesos, ordinary expenditures at 3,185,600,000 pesos; actual revenue in the first half of the year was announced as 1,227,300,000 pesos, and expenditures for the same period were 1,385,400,000. By November a deficit of over 570,000,000 pesos was expected. On June 30, 1943, money in circulation totalled 2,668,600,000 pesos (Dec. 1942: approx. 2,200,000,000 pesos).

Trade and Communication.—Exports for the first seven months of 1943 totalled approximately 512,500,000 gold pesos in value; imports, approximately 322,000,000 gold pesos (total trade for 1942 was: exports, 862,800,000 gold pesos; imports, 621,600,000 gold pesos). Exports in 1942 went mainly to the United States (80.3%); Europe (mainly Great Britain) received about 3.5% of exports, and other Latin American countries, 16%. Goods from the United States formed 45.5% of total imports; from Europe (Great Britain and Sweden), 8.6%; from Latin American countries, 42.5%. Minerals formed the bulk of exports (in 1941, 79.8%, some 15% of which were nitrates and iodine). Copper was the largest single item of export. In the first three quarters of 1943, Chile built up a favourable trade balance with the United States amounting to $82,469,000.

Before the war Chile had extensive steamship connection with all parts of the world, partly under the Chilean flag (the three modern motorships of this line were purchased by the United States in July, 1943, leaving the Chilean company only six vessels available). Rail lines connect northern Chile with Bolivia, and combined rail and bus service, with Argentina. Reconstruction of the railway line across Uspallata pass, closed to rail service in 1934, was contemplated in agreements between Chile and Argentina. Air service to all parts of the Americas is supplied by Pan American Airways.

Internal communication is by highway, rail, air and coastal shipping. The railway system is 5,434 mi. in length, with the state owning 3,637 mi. There are 27,000 mi. of highway (approximately 16,500 mi. of this, unimproved dirt road). In 1941 the budget for highway construction amounted to 143,888,639 pesos. Internal air service is good.

Manufacturing.—Manufacturing establishments in Chile in 1941 numbered over 5,500, with nearly 300,000 employees. Production is largely textiles, leather goods, wood products and other items for domestic consumption. Production in 1942 was announced as 1.3% under that of 1941; in 1943 shortages of tools and machinery were reported.

Agriculture.—Agricultural production is large in value, but comparatively little of it is for export. Crop estimates for the 1942–43 season (in short tons) were: beans, 84,453; wheat, 940,955; forage barley, 44,161; malting barley, 34,003; oats, 84,969; rye, 6,921; chickpeas or garbanzas, 4,244; hemp, 22,587. Rice production was estimated at 128,275 short tons. In 1941 dried fruit exports amounted to 9,702 short tons. Wine production (1941) was 63,828,404 gal. The 1942–43 potato crop was officially estimated at 526,874 short tons. Lumber production in 1942 was 1,652,466 ft. (1941: 2,283,181 ft.).

Minerals.—Minerals comprise the greater part of Chilean exports. Coal production in 1942 was 2,370,992 short tons (in 1941: 2,272,469 short tons); gold, 12,844 lb. (1941: 17,694 lb.). Nitrate production (for the year ending June 30, 1942) was 1,502,392 short tons. Exports of other minerals were (1941 figures): copper, 499,923 short tons; manganese, 23,589 short tons; iron ore, 1,787,591 short tons; silver, 84,573 lb. (D. RD.)

China. China, a republic of Asia. Area, 4,480,992 sq.mi.; excluding Manchuria, Outer Mongolia and Tibet proper, 2,903,475 sq.mi. (more than 10% constituted occupied China). Estimated total population 450,000,000, with over 200,000,000 in occupied China. Wartime capital, Chungking (pop. 880,000, police census 1943). Cities over 1,000,000: Shanghai, Peiping, and Tientsin; cities close to 1,000,000: Nanking and Canton; cities over 500,000: Changsha and Chengtu; cities over 200,000: Kunming, Sian, Kweiyang, Foochow and Tsingtao; cities over 100,000 in population total about 100. President (1943): Chiang Kai-shek.

History.—Although a military stalemate continued to prevail in China, 1943 witnessed notable strides in the development of constitutional democracy and closer co-operation and amity between China and her allies.

China's hope for a brighter future rose with the signing of the

UNITED NATIONS DAY—June 14, 1943—was celebrated in Chungking with a parade of 10,000 people on Democracy road

Sino-American and British new treaties on Jan. 11, 1943, and ratification on May 10 which abolished extraterritoriality and related privileges. To undermine the effect of the new treaties Japan took similar steps in occupied China. China's faith in U.S. friendship was further augmented by the repeal of the Chinese exclusion law which passed the U.S. house of representatives on Oct. 21 and the Senate on Nov. 26. The improvement of China's relations with soviet Russia and Great Britain was demonstrated by the withdrawal of Russian troops from Sinkiang and repeated friendly and enthusiastic messages to Moscow by Chiang and by the reciprocal visit of the Chinese government mission to London in November.

The recall of the Chinese military mission to Washington on Dec. 31, 1942, was regarded as an indication of China's disappointment in Allied strategy. The meagre aid to her under the Lend-Lease arrangement (out of a total of lend-lease aid of $8,253,000,000 to American Allies from March 1941 to Dec. 1942 China received only $156,738,000) prompted Madame Chiang to emphasize the importance of the China front and the tenacity of the Japanese in her addresses to the U.S. congress on Feb. 18, 1943. President Roosevelt's statement on Jan. 7 that "all the formidable obstacles to get the battle equipment into China" would be overcome and his pledge on Feb. 19 of rushing arms to China gave assurance to China.

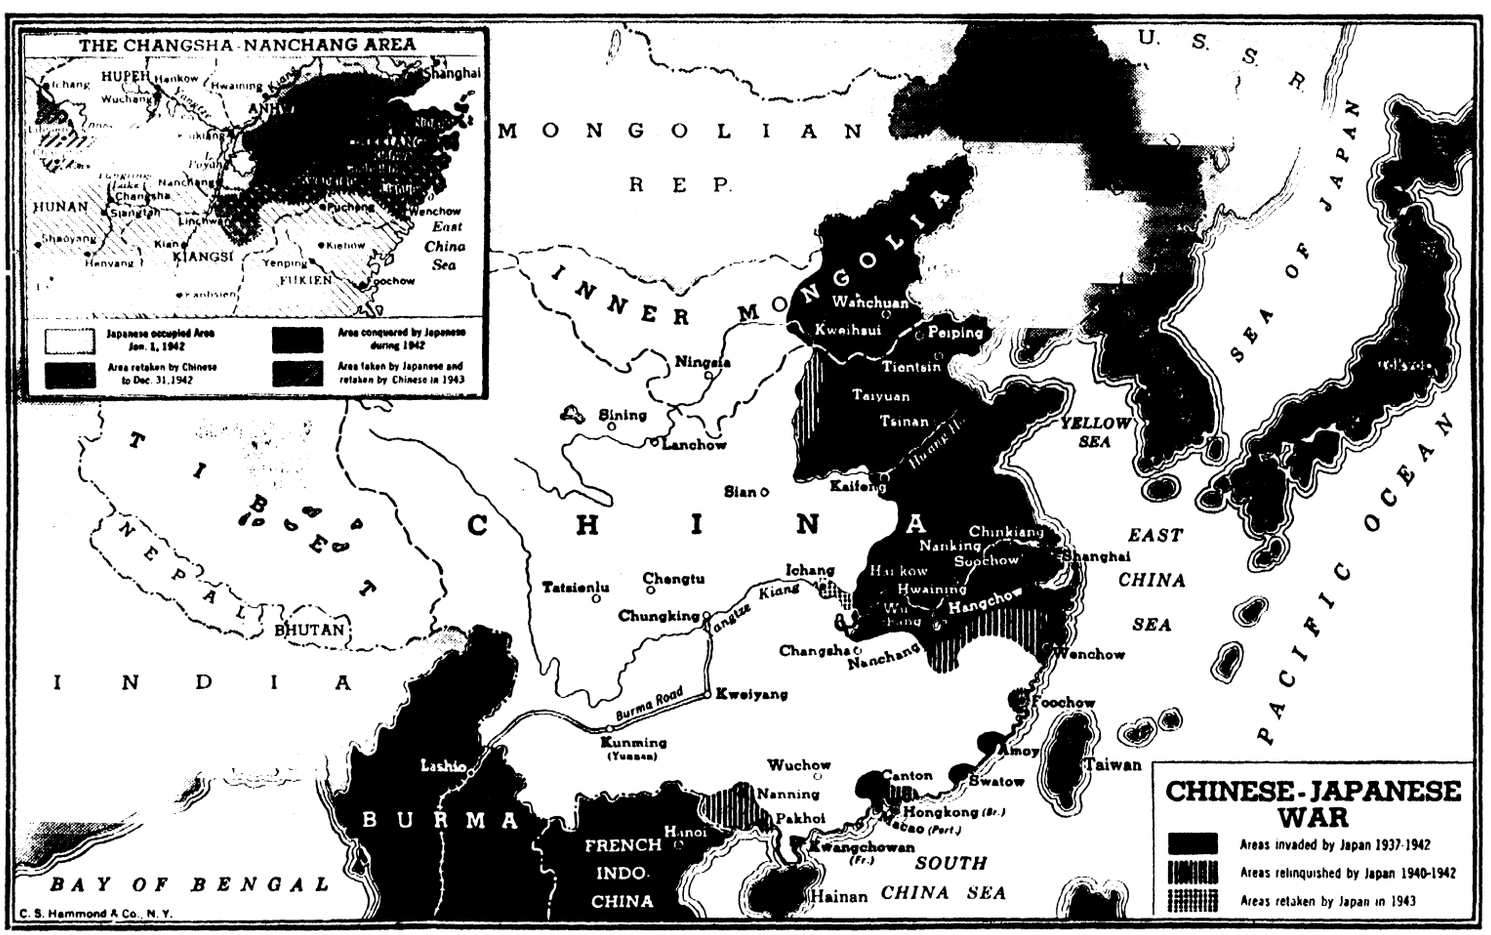
Although China was not invited to the Casablanca conference, the announcement on Jan. 27, 1943, regarding the Allied objective of nothing less than unconditional surrender by the axis was welcomed by Chungking. On Feb. 5–7 General Henry H. Arnold and Field Marshal Sir John Dill discussed military actions against Japan with Chiang in Chungking. On Feb. 12, President Roosevelt said that great and decisive action would be taken to "drive the invaders from the soil of China." At the Quebec conference, which T. V. Soong joined on Aug. 22, the chiefs of staff turned their attention "very largely upon the war against Japan and the bringing of effective aid to China." The creation of a

CHINESE CASUALTIES being borne to the rear from the Salween river front in 1943

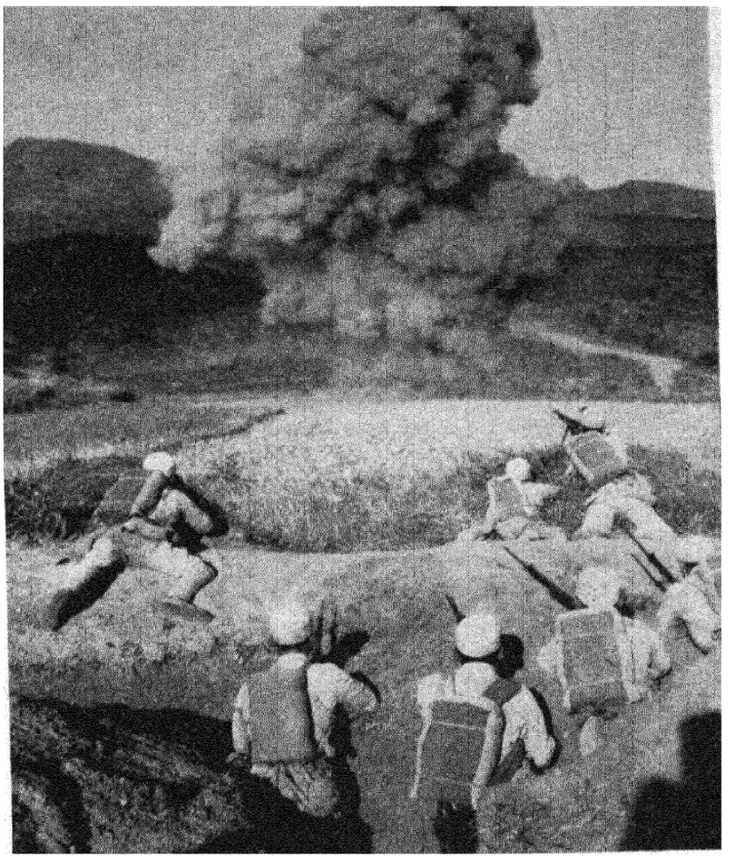
Southeast Asia command under Lord Louis Mountbatten by the Quebec conference, his subsequent conference in Chungking with Chiang, and assurances by British officials that Britain "will continue full military co-operation with the United States and China until Japan is defeated" gratified China. The Joint Four-Nation declaration of Nov. 1 at Moscow recognized China's position as one of the big four United Nations and frustrated Japan's hope for a negotiated peace. The Cairo conference solidified the four-power entente and vindicated China's territorial integrity and the justness of her cause by promising the restoration of all territory stolen from China by Japan since 1895.

Japan's military actions in China in 1943 were accompanied by repeated peace offers, one of which promised a return to the *status quo* of July 7, 1937. In an effort to force China out of the war before the Allies could launch a major offensive in the Pacific, Japan opened an offensive in western Hupeh and Hunan on May 11, aiming at Chungking and Changsha, which ended in a disastrous defeat in June. Early in November Japan renewed her attempt for the fifth time to capture Changsha in order to control the "rice bowl" and the railroad line to Canton, and see-saw battles developed around Changteh. With the support of the U.S. air force the Chinese routed the Japanese at Changteh toward the end of November. Japan's three-pronged drive up the Burma road in October was equally unsuccessful.

Following the death of Lin Sen on Aug. 2, Chiang became acting president and on Sept. 10 the Central Executive committee revised the organic law of the national government making the president chief executive and commander-in-chief of the military forces with three years' tenure. On Sept. 13 the committee unanimously elected Chiang president. On the same day Chiang stated that the Chinese communist problem was "a purely political problem and should be solved by political means." The committee resolved on Sept. 12 that a democratic constitutional government would be created within one year after the end of the war. The Committee for the Establishment of Constitutional Government of 60 members, including two communists, was inaugurated on Nov. 12 to facilitate the establishment of constitutionalism.



China's serious domestic problem in 1943 was inflation; commodity prices rose to more than 100 times the prewar level.



Education.—The universities and technical colleges increased from 108 in 1937 to 133 in 1943 and the total enrolment in 1943 was 57,832 against 31,188 in 1937. About half of the 1943 students majored in science and technology. Of the 133 colleges, 51 were private institutions and 82 operated by the national and provincial governments. In 1940 appropriations from the national treasury to higher education and cultural institutions amounted to 44,130,000 yuan, 19,000,000 of which went to higher education.

The number of secondary educational institutions in Free China totalled 2,819 in 1942 (with an enrolment of over 600,000), against 3,264 in 1937; one-third of these were in areas occupied by Japan. In 1942 there were 232,145 primary schools with an enrolment of over 22,242,844 in Free China; the total number of persons between 5 and 15 was about 75,000,000. According to the ministry of education, about 48,000,000 of the 165,000,000 illiterates between the ages of 15 to 45 had been taught to read by 1943.

Defense.—In 1943 the army was estimated at 20,000,000, of which about 5,000,000 were front line troops. After the creation of the U.S. 14th army air force as a separate unit in China in March, Chinese air force pilots flew alongside their U.S. comrades. There were more trained Chinese pilots than planes, and those who received advance training in the United States amounted to several hundred.

Finance.—The official exchange rate of the national dollar was maintained at U.S.$5 for Chinese 100. Although no official figures were issued, the volume of note issue in 1943 was estimated at over 25,000,000,000 yuan—about four times that of 1940. The budget for 1943 was reported to be 45 times that of 1937,

WELL-ENTRENCHED CHINESE MOUNTAIN TROOPS on the Salween river front. Here, near the Burmese border at China's "back door," the Chinese continued to stalemate Japanese attacks in 1943

which was slightly over 1,000,000,000 yuan. Before 1943 the total revenue constituted less than 30% of the total expenditures, but the financial authorities hoped to raise it to one-half in 1943. From 1937 to 1943 the total internal loans floated were 3,430,000,000 yuan, 100,000,000 custom gold units, £20,000,000, and $300,000,000. The foreign loans extended to China from 1937 to Dec. 1942 amounted to $1,200,000,000, about half of which had not been used.

In July 1942 the right to use bank notes was centralized in the Central Bank of China. Government control over privately owned commercial banks was tightened; no new banks, except the county banks, were allowed to be formed. Besides the 300-odd modern and native banks, 175 county banks were established by May 1943.

Trade and Communication.—China's chief wartime exports were silk, bristle, coal, wood oil, tea and mineral products. Foodstuffs, principally rice, wheat and flour, were the chief imports. Due to the blockade China had to depend on the slender thread of air transport between India and Chungking as her international outlet.

Free China had 1,744 mi. of railroads, of which 1,000 were built during the war, and from Jan. to Aug. 1942 the railroads carried a total of about 17,000,000 passengers, 500,000 troops and 970,000 tons of freight. There were approximately 48,000 mi. of highway in Free China, and about 16,000 trucks aside from army trucks. A great part of all freight in Free China depended on stage and river transport. Free China had about 6,100 mi. of air routes with limited freight and passenger capacity. By the end of 1942 there were 41,175 mi. of telephone lines and 59,475 mi. of telegraph lines in Free China. Only 12 of the Free China cities had telephone service by the end of 1942. There were 10 large and 100 medium and small-sized broadcasting stations in Free China.

Agriculture.—Roughly 60% of the prewar agricultural and livestock production remained in Free China. The prewar average food harvest of the 15 interior provinces was about 1,670,000,000 piculs on 635,000,000 mou of land, and the production and acreage showed slight change since 1937 (1 picul = 133⅓ lb.; 1 mou = 806.65 sq.yd.). In 1941 the total rice and wheat crops of Free China was 808,000,000 piculs. Livestock production had steadily declined since 1937. The collection of rice and wheat by tax payments in kind and by compulsory purchase proved successful, and the collection in 1942–43 was expected to increase from the 72,000,000 piculs of 1941–42 to 80,000,000, and the collection was more than enough to feed the army and public functionaries and their families.

Manufacturing and Mineral Production.—In 1942 the number of heavy industrial plants in Free China under the control of the national and provincial governments numbered about 100 each, while the privately owned factories totalled about 2,000, approximately 450 of which were concentrated in the Chungking area. In order of importance these private factories were: machinery, chemicals, textile and clothing, metallurgical, food, electrical equipment and printing. The production of important minerals in Free China in 1942 was approximately: coal, 6,000,000 tons; crude oil, including vegetable oils, 9,000,000 gal.; steel, 10,000 tons. In spite of the steady industrial progress the low volume of oil, iron and steel handicapped the program of making Free China self-sufficient even in the most essential industries. Chittenden, Russell Henry (1856–1943), U.S. scientist and physiological chemist, was born Feb. 18 in New Haven, Conn. He was graduated from the Sheffield Scientific school (Yale university), 1875, with a Ph.B. degree and received his Ph.D. in 1880. Dr. Chittenden was an assistant instructor at Sheffield, 1875–77, professor of physiological chemistry, 1882–1922, and thereafter professor emeritus of that department. He was director of the Sheffield Scientific school, 1898–1922. An authority on nutrition, he was credited with the discovery of glycocoll and glycogen in the free amino acid of living tissue later known as protein. Among his works are *Studies in Physiological Chemistry,* four volumes (1884), *Physiological Economy in Nutrition* (1905), *Nutrition of Man* (1907) and *Development of Physiological Chemistry in the United States* (1930). He died in New Haven, Conn., Dec. 26.

Chosen (KOREA). A part of the Japanese empire since 1910, Chosen is a peninsula extending southward from the northeastern side of the continent of Asia. It is bounded E. by the Sea of Japan, W. by the Yellow sea and N. by Manchuria and the maritime province of Siberia. Area, 85,206 sq.mi., including 1,018 adjacent islands; pop. (Oct. 1, 1940) 24,326,327. The population as of December 31, 1938, was 22,633,751, including 633,320 Japanese and 49,815 other foreigners. The capital is Seoul (Keijo), pop. (1938) 737,214. Other cities: Fusan (213,744); Phyong-yang (Heijo) (234,726); Taikyû (172,040). Buddhism, Confucianism and Taoism are prevalent forms of religion. There were 494,500 Chosenese and 5,800 Japanese Christians in Chosen in 1938. Chosen is ruled by a Japanese governor-general, appointed by the ministry of overseas affairs. The gov-

ernor-general in 1943 was General Jiro Minami, appointed to this office in 1936.

History.—Chosen was not a theatre of hostilities during 1943 and little authentic news came out of the country. It was one of the decisions of the Cairo conference of President Roosevelt, Prime Minister Churchill and Generalissimo Chiang Kai-shek that Chosen should be freed from Japanese rule after the war and receive full independence "in due course." A leading representative of the Korean nationalists in the United States in 1943 was Dr. Syngman Rhee, who was chosen president of a Korean provisional government, formed in the French concession of Shanghai in 1919. In 1936 a working agreement had been reached between the middle class nationalist and communist groups working against Japanese rule.

Education.—Chosen in 1938 possessed 3,372 elementary schools, with 1,311,270 pupils. There were also 53 high schools, with 27,867 students, 57 girls' high schools, with 22,277 students, 226 technical schools, with 34,060 students, 10 normal schools, with 5,565 students, 18 special colleges (for medicine, dentistry, etc.) with 4,015 students. There was only one university, at Seoul, with 558 students, many of these Japanese. But there were 9,086 Korean students in Japan.

Finance.—The unit of currency is the Japanese yen (23.48 U.S. cents before outbreak of war in the Pacific). The Chosenese budget for 1942–43 was balanced at a figure of 1,012,577,000 yen. The national debt, as of 1941, was 593,646,215 yen and the amount of currency in circulation was 437,669,000 yen.

Trade and Communication.—Chosen's imports in 1939 were 1,388,448,284 yen, exports were 1,006,793,785 yen. For nine months of 1940 (after which period figures were no longer published) imports were 1,176,120,813 yen, exports 700,848,030 yen. There were 17,011 mi. of roads in 1939 and 2,619 mi. of government and 1,107 mi. of privately owned railways in 1940. There were 738 steamships of a total of 106,712 tons and 1,125 sailing ships of a total of 45,431 tons in Chosen in Dec. 1939. The length of telegraph and telephone lines in 1941 was respectively 5,406 mi. and 6,780 mi.

Agriculture, Manufacturing, Mineral Production.—Chosen is predominantly agricultural, with rice as its main crop. The rice crop was 106,775,869 bu. in 1940. There were 1,705,000 cattle, 1,400,000 pigs, 51,000 horses and 20,000 sheep in Chosen in 1939. Other important crops are barley, millet, apples, rye and soybeans.

The growth of industries important for war purposes is reflected in the following figures of value of output:

	1933	1938
Chemical products	51,992,000 yen	352,819,000 yen
Metals	29,238,000	91,966,000
Machine tools	3,010,000	26,798,000

The list of industries developed in Chosen includes cotton and rayon, cement, paper and pottery. Gold, iron, coal, wolfram and mica are important mineral resources. (W. H. Ch.)

Christian X (1870–), king of Denmark, of whom a biographical account will be found in *Encyclopædia Britannica*. Nephew of Queen Alexandra of Great Britain, he succeeded his father, Frederick VIII, in 1912. Despite a serious fall from his horse in Oct. 1942, and ensuing pneumonia, the king remained the symbol and heart of Danish passive resistance to the nazis. When in Aug. 1943, opposition became open rebellion the Germans imprisoned Christian at Sorgenfri castle (Aug. 29). Even when nazi guards were removed, mail and telephone messages were still controlled, and the king, recognizing that he could not be a free agent, pledged himself to sign no call for a new government as long as the Germans remained in Denmark. His 73rd birthday, Sept. 26, was the occasion for tens of thousands of greetings from a people who loved and admired him for his unyielding courage. On his way to Sorgenfri under "arrest" he had the opportunity to hear a group of Danes discussing earnestly among themselves, and said to them, "I am glad to hear that Danish is still spoken in my country. Keep it up." (*See* also Denmark.) (F. D. S.)

Christian Mission on World Order. A Christian Mission on World Order was opened on Oct. 28, 1943, at the Cathedral of St. John the Divine in New York city. It was followed by a series of meetings conducted by "teams" of ministers and laymen in 100 of the principal cities of the United States. Morning and afternoon study group meetings were held for over 20,000 persons. In the evening large massmeetings were held. The mission was initiated by the commission on a just and durable peace of the Federal Council of the Churches of Christ in America, and was sponsored by the Federal Council and by the Foreign Missions Conference of North America, the Home Missions Council of North America, the International Council of Religious Education, the Missionary Education Movement and the United Council of Church Women. All the activities were on an interdenominational basis.

The purpose of the mission was to seek to revive in the American people a sense of destiny in the performance of a great work of creation. That work of creation was portrayed as building a world fellowship, political expression of which would be as set out in the commission's statement "Six Pillars of Peace." Those were: (1) general collaboration between all nations; (2) particular collaboration on economic and financial matters of worldwide import; (3) international machinery to promote peaceful change as future conditions make necessary; (4) international organization to assure that the government of subject peoples is directed toward ultimate autonomy; (5) control of armaments; (6) an international bill of rights to assure intellectual and religious liberty. (J. F. D.)

Christian Science. In 1943, the Christian Science Mother Church, The First Church of Christ, Scientist, in Boston, Massachusetts, through its Camp Welfare Activities supervised the work of 143 paid Christian Science Wartime Ministers and over 300 volunteer Christian Science Wartime Workers, who ministered to the spiritual needs of Christian Scientists and others in the armed forces in the United States and its territories, Canada, Great Britain and Northern Ireland, Australia, New Zealand and the Middle East.

These civilian workers serve with the approval and assistance of army and navy chaplains and commanding officers. They respond to calls for Christian Science help or healing, conduct Christian Science services, and provide Christian Science literature.

In 1943, there were 17 Christian Science chaplains in the United States Army and one in the United States Navy. Nine served in combat areas, and one was decorated by the French military authorities for unusual bravery during action in the Tunisian campaign.

During 1943, the Christian Science War Relief Committee, maintained by The Mother Church, shipped to England for free donation 256,887 pounds of clothing, valued at $256,887. Shipments of clothing to Russia for free distribution there amounted to 209,894 pounds, valued at $209,894. Donations of clothing were made to refugees of many nationalities in the United States, Canada, England and Russia, and to the Greeks in Egypt. In the fall, a shipment was sent to Malta.

The War Relief Committee distributed 173,963 knitted gar-

ments to men in the United States armed forces. The value of the yarn used in knitting these gifts was $153,856.

The healing and redemptive activities of the Church always have the primary place in Christian Science. *The Christian Science Journal,* official organ of the Church, contains a directory of branch churches, societies and authorized practitioners. Reading Rooms open to the public for study and meditation are also listed.

In September 1943, the Mutual Broadcasting System and the world-wide staff of *The Christian Science Monitor* joined facilities in a new type of integrated news programs with daily pick-ups from *Monitor* correspondents all over the world.

During 1943, *The Christian Science Monitor* received the F. Wayland Ayer Cup for excellence of typography, makeup and presswork, and a medal and citation awarded by the University of Missouri School of Journalism for fulfilment of the assignment given to it by Mary Baker Eddy "to injure no man, but to bless all mankind." (C. P. S.)

Christian Unity. While the war prevented world gatherings of churches planned for 1943, the work of the World Council of Churches in formation went steadily forward. Regional meetings of its administrative committee were held; its secretaries officially visited nine countries, and frequent intercontinental visitation of leaders in behalf of the oecumenical movement took place between Europe, Australia, Asia and America. Seven additional churches joined the World Council during the year: Hungarian Lutheran, Presbyterian Church of Ireland, the Assyrian Church, the Anglican Church of New Zealand, the Cumberland Presbyterian Church of the United States and the Canadian Friends Yearly Meeting, also the General Convention of New Jerusalem.

Recently returned missionaries from North China reported that close federation of churches in that region developed quite apart from Japanese political pressure. An influential gathering in Chengtu of leaders representing thirteen denominations still operating in Free China, endorsed the idea of a united church for the postwar nation. On the other hand, the hope of final action approving the South India Scheme of Union was delayed by the unreadiness of certain elements in the existing United Church.

In Hungary the Reformed and Lutheran churches established an oecumenical council with view to collaboration with the World council. In England the committee on co-operation between the Free Churches issued an interim report which failed to recommend any specific action.

Baptists in Canada, divided into three regional groups, appointed committees to explore the possibility of union through a triennial general assembly. Arrangements for a Canadian Council of Churches went forward during the year.

Sharp division of opinion in the Commission on Approaches to Unity of the Protestant Episcopal Church caused the preparation of majority and minority reports with respect to relations with the Presbyterian Church in the United States of America. The minority report would have reconstituted the commission and virtually stopped active negotiations for organic union with the Presbyterians. Rather than face the possibility of an acrimonious discussion in the General convention, both parties finally agreed on a compromise resolution which was adopted, continuing the commission, with some change in personnel, under its present authorization to negotiate for organic union, but with agreement to refer the issue to the Lambeth Conference of Anglican Bishops before final consideration. No further action on this issue was taken by the Presbyterian Church in the United States of America during the year.

The committees negotiating the union of the Northern and Southern Presbyterian churches of the United States presented to their respective bodies for consideration and discussion a proposed constitution and directory of worship, but asked no immediate action upon them.

A committee representing the Northern Baptist convention and the Disciples of Christ met in Chicago in December to canvass the possibilities of closer relationships between these two denominations. Several points of possible co-operation were formulated which were later expected to be worked into the plan for submission to the two Churches. Their actual uniting was not, in 1943, under discussion.

Active discussion of full organic union, on terms formulated in 1943, continued in the Congregational Christian and Evangelical and Reformed Churches, paralleled by meetings for closer acquaintance and co-operative action in numerous centres. The proposed basis of union, revised in the light of these discussions, was to be put before the national bodies of the respective churches in 1944.

The biennial convention of the United Lutheran brotherhood, representing six synods, adopted resolutions calling for a nation-wide study by laymen of the problems in Lutheran unity and urging leaders to intensify their efforts in this behalf. The monthly organ of the American Lutheran conference conducted a vigorous crusade for such unity in an elaborate series of editorials throughout the year.

The Federated Orthodox Greek Catholic Primary Jurisdictions in America was formally organized in December by the adoption of a constitution. This federation included the following Orthodox churches: Russian (one division), Serbian, Ukrainian, Carpatho-Russian, Rumanian and Syrian. It was constituted by action of their administrative authorities rather than by the canonical action of the church bodies themselves, but expected to create a united Orthodox front in America which might lead to many forms of co-operation.

It planned to develop a union school of theological education to be conducted in English, and applied for membership in the Federal Council of Churches. (H. P. D.)

Chromite. World production and distribution of chromite was disorganized by the war in about every way possible. The United States is not normally a producer, but consumes half or more of the world output; because most of the sources of supply were in remote parts of the world shipping difficulties, shortage of bottoms and submarine losses seriously affected the supply from Africa, India and New Caledonia. Then approximately one-quarter of the potential output was lost by the occupation of Greece and Yugoslavia by Germany and of the Philippine Islands by Japan. The closing of the Mediterranean bottled up the Russian supply, and made it necessary to ship Indian and Turkish ore around the southern point of Africa. Besides, Turkey was not at war with Germany, and enormous diplomatic and economic pressure was put on the country to force it to ship chromite to Germany but without much success. Cuba was the only material producer from which supplies could be obtained without serious complications, but even in spite of these handicaps the United States supply was kept to a reasonably satisfactory level, from imports and from emergency domestic production, and by late in 1943 reserve stocks had been built up to a point where the production from marginal domestic mines was ordered discontinued. Production was developed in four areas in Canada, but output was far short of requirements. (G. A. Ro.)

Chronology: *see* CALENDAR OF EVENTS, 1943, PAGES 1–15.

Church, Samuel Harden (1858–1943), U.S. industrialist, was born Jan. 24 in Hamilton, Caldwell Co., Mo. Compelled to give up school to help support his family, he found work as messenger boy with the Pennsylvania railroad, rose to superintendent of transportation of a branch office in Ohio and eventually became vice president of the railroad. Meanwhile, he continued his education and received degrees from Western university of Pennsylvania, Bethany college, W. Va., and Yale. He was made trustee of Carnegie institute when it was founded early in the 1900s, was its secretary until 1914 and was then named president—a post he held until his death. During both world wars he denounced Germany's wartime leaders and urged collective action against them. In 1914, shortly after the outbreak of war, he charged Germany with the "murder of civilization." Again, in 1940, he made international headlines with the announcement that he had been authorized to offer a $1,000,000 reward for the capture of Adolf Hitler, alive and unhurt, and his delivery to the League of Nations for trial. Church died in Pittsburgh, Oct. 11.

Churchill, Winston Leonard Spencer (1874–), British statesman, was born at Blenheim palace, Oxfordshire, England, on Nov. 30, the elder son of Lord Randolph Churchill and Jennie, daughter of Leonard Jerome of New York city. For his biography and his political career during World War I, see *Encyclopædia Britannica.*

The outbreak of war on Sept. 3, 1939, was the occasion for Churchill's re-entry into the cabinet in his old office of first lord of the admiralty. On May 10, 1940, when the German drive on France began, Chamberlain resigned and Churchill became prime minister. Churchill emerged as a fighting leader and on June 4, 1940, after the evacuation of Dunkirk, he promised that Britain would fight on alone "whatever the cost may be."

The year 1943 was one of personal triumph for the British prime minister. Under his guidance England had been converted into a powerful military and air base. His arch-foe Hitler had been driven out of Africa and Sicily and was losing ground in Italy. Mussolini vanished as a political figure of importance, and at the end of the year Allied armies were preparing an invasion of western Europe from English bases. The planning and preparation that led to these successes were laid down, for the most part, in the six major conferences which Churchill attended in 1943. They were: (1) the Casablanca conference, Jan. 15–24, at which he and President Roosevelt agreed to demand unconditional surrender of the axis; (2) the Washington conferences, which started May 11, at which Churchill and Roosevelt decided on the strategy for the invasion of Sicily and Italy; (3) the Quebec parleys in August with Roosevelt, during which Churchill extended an invitation to Stalin to join a tripartite conference but bluntly declared that the Allies would not open a second front until it was militarily feasible; (4) the Cairo conference, Nov. 22–26, with Chiang Kai-shek and Roosevelt, in which agreement was reached to crush Japan; (5) the Tehran conference, Nov. 28–Dec. 1, with Stalin and Roosevelt, at which the conferees concerted plans for destruction of German military power and opening of second front; and (6) the second Cairo conference, Dec. 4–6, with Roosevelt and Turkish Premier Inönü, in which the "closest unity" of Turkish and Allied views was expressed.

With regard to postwar foreign policy, Churchill urged in an address at Harvard university on Sept. 6, 1943, intimate U.S.-British postwar co-operation, declaring no world peace system would be practicable without this unity. On plans for domestic reconstruction after the war, Churchill scolded critics for devoting too much discussion to postwar plans while the war was not yet won. Churchill's speeches in 1943 sparkled with their customary literary power and vividness. Like a biblical prophet, he told commons on Feb. 12 that the Allies were resolved "to burn and bleed" Germany. On June 30 he made the famous prophecy of heavy fighting in Europe "before the leaves of autumn fall." On July 27, he warned Italy to surrender or be "seared and scarred and blackened." On May 19, addressing a joint session of the U.S. congress, he vowed that Britain would fight side by side with the U.S. against Japan "while there is breath in our bodies and while blood flows through our veins." In Dec. 1943, his health was taxed by his exertions, and he was taken seriously ill with pneumonia in the Middle East. By the end of 1943, however, he was well on the way to recovery.

Church Membership. The following figures are from the 1943 edition of the *Yearbook of American Churches,* compiled under the auspices of the Federal Council of the Churches of Christ in America, summarizing the

reports made by 256 religious bodies for the continental United States. The "inclusive membership" column gives the official records of the church bodies. The "13 years or over" column is given for use in comparisons and discussions of the relative numerical standing of the churches reported.

The total reported church membership in 1942 was 68,501,186. This was 51.1% of the total population of the continental United States, 133,953,225 persons, as estimated by the federal bureau of the census for Jan. 1, 1942. It was the highest proportion of church membership in the total population ever reported—a fact due partly to increase in church membership and partly to the incompleteness of former reports. Between 1926 and 1942, the reported church membership increased 25.5%, while the estimated population of the continental United States increased 14.3%.

Fifty-two religious bodies had 50,000 or more members each, and 97.2% of the church members of the nation belonged to these bodies. The remaining 2.8% were in 204 smaller bodies. Of the total reported church membership, 33.4% was Roman Catholic, 1.8% Old Catholic and Eastern Orthodox, 6.8% Jewish, and 58% Protestant.

*Continental United States only.

(L. A. We.)

Church of England. The year 1943 was an encouraging one in ecclesiastical history. The growth of the armed forces called for the release of more and more clergy from the already understaffed parishes to make good the shortage of navy, army and air force chaplains. In the religious life of the forces outstanding success attended the institution in many units of a kind of one-man religious "brains trust" known generally as "The Padre's Hour." Success also attended the work of the specially selected women who were assisting the chaplains in work among the women members of the forces.

In the more domestic life of the church four matters were outstanding: (1) The long and complicated education question reached a new stage with the publication of the government scheme. Speaking in the house of lords on Aug. 4 the archbishop of Canterbury (Dr. W. Temple) was able to give, with some qualifications, a cordial welcome to the first outline of this scheme and expressed the hope that the proposals would "secure and strengthen the religious foundation of education in all its stages."

(2) The cause of Christian reunion was furthered by a joint statement of Christian belief issued by the archbishop of Canterbury and the moderator of the Free Church Federal council on Jan. 4, and by a series of speeches and addresses by the archbishop of Canterbury. These included a memorable address to the joint synod of the convocation of Canterbury on May 25, in which he said that the divisions of Christians blunted the appeal to the general public at home or to the adherents of other religions abroad, and that "the obligation to attain to a real and organic unity of the church as the Holy Spirit may guide us, is urgent." In this connection the rather controversial problem of the scheme for church union in South India was the subject of prolonged discussion during the year.

(3) Interest in the problems of evangelism, including the presentation of the Gospel in terms of modern thought and the use of modern methods such as religious "brains trusts," broadcast and cinema services, etc., was stimulated by a debate in the summer session of the church assembly.

(4) Plans were also discussed for postwar reconstruction with a view to the more effective use of the available clerical manpower through the grouping of parishes and the adaptation of the parochial system to the situation created by enemy destruction of so many churches and the new needs of a population much shifted by war time movements of industry. Such plans should be facilitated by the Reorganization Areas measure introduced in the church assembly by the bishop of London. The better payment of the clergy should be facilitated by a new scheme ("Scheme K") issued by the ecclesiastical commissioners.

In the wider field of the Anglican communion the more notable events included the progress of the consideration of the South India scheme mentioned above; the appointment of the Ven. W. H. Stewart, archdeacon in Palestine, Syria and Trans-Jordan, to be bishop in Jerusalem; and last but not least, the flight of the archbishop of York to Moscow in September to convey a message of greeting to the patriarch of the Russian Orthodox Church from the archbishops of Canterbury and York in furtherance of "the friendly relationships" (in the words of the archbishop of Canterbury) "between the Church of England and the Orthodox Churches, including the Church of Russia."

Citrine, Sir Walter McLennan (1887–), British labour leader, was born in Liverpool Aug. 22, 1887, of working-class parents. After

attending elementary schools, he found work as an electrician in Lancashire. He soon became active in the electricians' union and in 1914 became Mersey district secretary of the Electrical Trades union. In 1924 he was appointed assistant secretary to the Trades Union congress and acting secretary in Oct. 1925, after which he became the effective head of the British trade union organization. As such he has pursued a policy defined by himself as one of "opposing equally all dictatorships whether of the Right or of the Left." Citrine accepted a knighthood in 1935 and was made a member of the privy council in 1939. He was elected president of the International Federation of Trade Unions in 1928, and was a member of the government economic advisory council (1930–33) and of the B.B.C. general advisory committee. After the outbreak of World War II Citrine travelled widely as spokesman and delegate of the T.U.C., visiting France in 1939, Finland in 1940, the U.S.S.R. in Oct. 1941 and the U.S.A. in the winter of 1940–41. His diaries of the last three journeys are among his many publications. (H. W. At.)

Civilian Defense.

United States.—The United States Office of Civilian Defense was established May 20, 1941, to assure effective co-ordination of federal relations with state and local governments engaged in the furtherance of the various war programs; to provide for necessary co-operation with state and local governments with respect to measures for adequate protection of the civilian population in emergency periods; and to facilitate constructive civilian participation in the war program on the home front.

To carry out its functions, the Office of Civilian Defense has two principal divisions: the protection branch (which operates throughout the nation as the U.S. Citizens Defense corps), and the civilian war services branch (whose volunteers are members of the U.S. Citizens Service corps).

The operating unit in the local community was the defense council. In 1943, there were established throughout the U.S. 11,486 defense councils. On April 30, 1943, there were 5,510,000 men and women enrolled for training and service with the Citizens Defense corps. Trained to meet the hazards of enemy action, they utilized their training in innumerable natural disasters. They helped combat floods, fires, tornadoes, train wrecks and mine explosions. On Feb. 28, 1943, there were 3,371,000 men and women in the Citizens Service corps who worked in the fields of agriculture, consumer education, family and children's services, health, housing, manpower, nutrition, salvage, social protection, transportation, recreation and war savings.

Citizens Service Corps.—The civilian war services branch had the responsibility of assisting state and local governments in organizing defense councils to serve as the focal point for co-ordination of community resources in meeting local problems arising from the war.

Defense councils, with their committees and block organizations, engaged in many other programs: car sharing, vacant room surveys in war industry towns, explanation of point rationing, surveys of day-care needs for children of working mothers, securing donations for the blood plasma bank, victory gardens, scrap collection, tin can processing and collection, manpower and womanpower surveys for war industries, share-the-meat campaigns, the promotion of part-time and full-time aid for farmers, etc. These programs were carried out through the United States Citizens Service corps.

Co-operating with the U.S. department of agriculture, defense council committees during 1943 engaged in an over-all campaign to promote the production, sharing and scientific use of food. Defense councils helped mobilize townspeople for work on farms and in the planting of 20,000,000 victory gardens. Consumer committees co-operated in OPA's market basket and home-front pledge campaigns to combat the black market. Clothing clinics, "swap shops," courses in the care and repair of household equipment were sponsored. War price and rationing boards were aided by the efforts of consumer and other committees in the campaigns to increase community understanding and participation in the price control and rationing programs.

The children of an America at war required especial care and understanding. Over 1,000 child care committees were organized by defense councils to study the needs and to promote community programs for the children of mothers working in aviation, munition and other war plants. In 500 communities, federal funds amounting to more than $12,000,000 had been provided under the Lanham act to enable war impact areas to open nurseries and pre-school centres. Thousands of civilian defense volunteers worked in the nurseries, at recreation centres, playgrounds, schools, etc., and the scope of their activities was widened to include juvenile delinquency, child labour and other hazards affecting children in wartime.

The health of the home front was also a weapon in total war. In several states, civilian war services volunteers compiled complete rosters of all available nursing personnel and established these rosters on a county basis; registered nurses were placed in charge of all records and had the authority to call out nurses for special service in emergencies such as fires or train wrecks. Defense council health committees took part in the campaign to recruit men volunteers for work in hospitals to relieve the acute shortages of maintenance men and orderlies; this campaign was sponsored in co-operation with the American Hospital association.

Numerous important salvage campaigns were staged in 1943. In most communities, the salvage committees established by the War Production board were incorporated into the defense council structure. Scrap metals, fats, greases, silk and nylon hose, tin cans were combed out of the backyards, kitchens and homes of the United States and transformed into war goods. The conservation of private automobiles, tires and gasoline became the concern of civilian war services transportation committees working with the Office of Price Administration, Office of Defense Transportation and other agencies sponsoring car-sharing and conservation.

One of the most significant developments of 1943 was the establishment of the Junior Citizens Service corps by the national OCD. The JCSC officially recognized the war services of boys and girls under 16 and provided local defense councils with a mechanism for planning war service projects for organized and unaffiliated youth. In order to provide guidance to the JCSC, many states set up committees whose personnel represented youth interests on a state-wide basis. Typical war services being performed by the JCSC included: collection of scrap metals, fats, clothing, books for soldiers; assistance at child care centres, hospitals, war and rationing boards, recreation centres; participation in national war bond and stamp drives; the raising and conservation of food.

Citizens Defense Corps.—The protection branch developed comprehensive programs for training and organizing volunteers to safeguard the civilian population by such means as blackouts and other defense against air raids, camouflage and protective construction, defense from bombs and gases, decontamination of gassed areas, rescue of endangered persons and civilian casualties,

evacuation and demolition of damaged structures and clearance of necessary thoroughfares, repair of disrupted utilities, auxiliary fire and police services, and many other "passive" defense measures. These programs were carried out through the United States Citizens Defense corps.

In each local community, the Citizens Defense corps was headed by a commander assisted by a staff. The operating units included: air raid wardens, fire guards, auxiliary firemen, auxiliary police, emergency medical services, rescue squads, emergency welfare services, messengers, control centre personnel, demolition and clearance, road repair, utility repair, etc.

During 1943, OCD's defense corps gave emergency service in floods, fires, war plant disasters, aviation accidents, etc. No region in the country escaped the shock of such emergencies. Floods in the midwest, fires in eastern factories and in western forests, explosions in southern mines were all tackled by volunteers trained to meet destructive forces. Many lives were saved and property damage was held to a minimum.

The well-organized and well-trained forces in the emergency medical services repeatedly gave aid in saving lives and in treating emergency casualties. These services included the administration of strategically based stocks of blood plasma, the functioning of mobile medical teams, the hospitalization and care of serious casualties and the use of life-saving procedures on the emergency scene. The medical division in co-operation with the U.S. public health service stored and distributed 158,290 units of plasma, liquid, dried and frozen in all important communities throughout the United States. Grants were made to 168 hospitals to enable them to establish plasma banks. In 20 coastal states, 321 institutions were designated as emergency base hospitals. Groups of physicians in more than 100 medical schools and hospitals responded to the invitation of OCD and the surgeon general of the U.S. public health service to form hospital units containing 15 doctors to the unit.

The war emergency radio service, a system of two-way communication for civilian defense inaugurated after specific authorization by the Federal Communications commission, was also used during 1943 in disasters, notably in the April and May floods in the middle west. Portable radios were used to route trucks, men, sand and equipment against the flood waters.

Communication via radio was paralleled with communication in the air. The Civil Air Patrol, organized a week before Pearl Harbor on the initiative of U.S. private flyers became an important unit of the protection branch. After organization and training by OCD, the CAP performed valuable services such as forest fire patrol, transporting blood plasma, reporting planes crashed on sea or land, etc. On April 29, 1943, the CAP was placed under the jurisdiction of the war department.

The former fire watchers service of the Citizens Defense corps was expanded and equipped to form the new and more effective fire guards. The national OCD also completed in 1943 the job of producing and delivering fire fighting equipment, including 7,000,000 ft. of hose, to the vital war areas. The volume of such equipment equalled approximately the volume of similar equipment produced in the previous 25 years.

In 1943, 124 cities and 2,260,000 people witnessed the demonstration "Action Overhead" which showed the nature and effects of enemy air raids. Staffed by members of the chemical warfare service, U.S. army, the demonstration resulted in widespread public education in the steps to be taken should raids occur. The education of the general public was one part of the over-all program. The system of schools and courses for the training of members of the Citizens Defense corps was revised in mid-year. The war department civilian protection schools were discontinued June 30. Revised standards of protection training were established by regulation, having been modified by British experience and the researches of OCD.

From its conception, OCD recognized British experience as the best available source of factual information for civilian protection in the United States. Commissions and individual representatives visited Great Britain. Reports were received from an attaché at the U.S. embassy in London. As of Oct. 20, 1943, 433 general reports and 116 medical reports had been received and consulted by selected staff members of the agency. On the basis of British experience, the rescue service was reconstituted and greatly enlarged. Two pilot schools for the training of instructors were held, one at the U.S. bureau of mines experiment station at Pittsburgh, Pa., the other at the University of California College of Mining, Berkeley, Calif.

The basic system of air raid signals was modified in Feb. 1943, by army regulations, concurred in by OCD, in order to provide intermediate audible public warnings between the confidential "Yellow" and the public "Red." Tests and exercises familiarized the public with these regulations and with the new signals. Exception was made for west coast communities which retained signals specified by the commanding general of the Western Defense Command. Extensive work was done to improve methods of blackout and dimout in coastal areas and important war centres. Dimout regulations were in effect along the coasts to reduce sky glow and to combat submarine sinkings. In addition, the protection branch worked with manufacturers to redesign warning devices and to make available sound machines capable of carrying warnings for great distances which would not require the use of critical materials.

The complex job of scientific and effective protection included the purchases not only of fire fighting equipment and medical supplies but of gas masks and other items. Those communities in critical areas unable to obtain equipment and supplies for themselves, were aided to protect themselves in the event of enemy attack. This job of distribution was virtually completed in 1943, including equipment for 5,400 medical field units and 1,500 casualty stations; gas masks produced were held in reserve at strategic locations for rapid shipment if needed.

The Emergency Welfare Service, organized during the year, brought together under one head five major functional services for use in emergencies or enemy attack: information and service centres; food and housing centres; central registry; clothing centres; rehousing and rehabilitation. Local Emergency Welfare Services operated jointly with state authorities and the American Red Cross in handling the emergencies and disasters of 1943.

A distinction was made, insofar as air raid hazard was concerned, between coastal areas and the interior of the country. In the latter case, a planned decrease in the protective forces was suggested to conform with the lessened danger of long range.

FIVE-MAN FIRE-FIGHTING CREW In a practice demonstration at a Flint, Mich., war plant in 1943

large-scale air attack. Dimout regulations were suspended by the army and navy in Oct. 1943 with a possibility of their return should the situation warrant it. (*See* also MUNICIPAL GOVERNMENT.) (J. B. MN.)

Great Britain.—The year 1943 continued to show on the whole reduced activity by the German air force. No attacks of any real magnitude were launched, though there were a few short but sharp attacks made by long-range bombers. On the whole, activity was limited to raids by fighter bombers.

There were certain important developments during the year. A considerable expansion took place in the number of mobile columns, which had proved to be a valuable asset for reinforcing local authority services. The standard of training possible to achieve at these columns was very high, and they did some excellent work.

Another important development was the amalgamation of the first aid and rescue parties. This was effected partly on grounds of economy in manpower and partly on grounds of efficiency. It was found that, normally speaking, rescue work was required before first aid, and that during the time when casualties were being extracted from the débris, the first aid parties were standing by. Under the amalgamation it was made possible to deploy the parties in accordance with the needs of the situation, thereby effecting considerable additional efficiency.

The fire guard organization continued to expand, and an attempt was made during the year not only to combine in one document all the orders and regulations in regard to the administration of the fire guard plan, but also to set up all over the country an organization based on a detailed plan. In many cases the fire guard organization separated from the wardens' service and became a separate organization. Close linking up for operational purposes was effected with the national fire service. In addition, special courses for fire guard instructors were instituted at the ministry of home security schools at Falfield and Easingwold.

The civil defense staff college continued with a great variety of courses covering all aspects of civil defense, and proved of much value in stimulating thought and helping to maintain training and efficiency at a high level. The development of the housewives' section of the W.V.S. and similar organizations progressed rapidly, and proved in action to be a valuable adjunct to the civil defense services. (*See* also GREAT BRITAIN.). (E. J. H.)

Civil Service, U.S.

The civil services of governmental jurisdictions throughout the United States found 1943 a year in which war-fostered conditions combined to create an acute and all-pervading manpower shortage. Prime factors in this shortage were the mounting demands of the armed forces, war industry and agriculture on the fast dwindling labour reserves of the country. For public personnel agencies, the recruitment and retention of personnel to maintain the essential functions and services of government became their major contemporary problem.

Inductions of public employees into military service continued at a steadily quickening pace. Police and fire officials in many localities were concerned over the depletion in the ranks of their departments, made more acute by their inability to secure replacements. Following the lead of the national government, most state and local jurisdictions kept requests for military service deferments of their employees to a minimum level; some refrained from making any such requests as a matter of general policy.

Varied devices to circumvent the manpower scarcity were initiated during the year. Civil service agencies turned to an increasing extent to the employment of women in jobs previously filled exclusively by men. Women operators and conductors appeared on several municipally owned streetcar lines; in Chicago, women lifeguards patrolled the city's public beaches. Teen-aged high school students in Birmingham, Michigan, were engaged to read the city's water meters. In the federal service, a concerted campaign to break down prejudices against the employment of physically handicapped workers resulted in the employment of more than 13,000 such workers in various government establishments. The work week of all federal employees was extended to 48 hours, and time-and-a-half pay for all work beyond 40 hr. per week was authorized, resulting in pay increases for most federal workers.

Rising living costs and the counter-attraction of high wages in war industry also caused numerous state and municipal governments to grant their employees pay increases during 1943. A noteworthy characteristic of this movement was the increased trend toward the adoption of schemes for gearing the rise and fall of public pay rates to corresponding fluctuations in living costs, particularly in the case of smaller city governments. Just prior to the beginning of the year, the National War Labor board modified its earlier stand by exempting state and local governments from previously established wage controls, as long as any increases made by them were not out of line with prevailing rates in their communities.

In June 1943, the number of paid civilian employees of the federal government within the continental limits of the United States reached an alltime peak of 3,002,453. Almost immediately, however, a sharp decline set in, and within three months the figure had decreased by approximately 200,000 employees. Congressional committees, bent on cutting federal expenditures, pressed for still further reductions and cited the need for closer control over future departmental requests for personnel. In state and local governments, less directly concerned with war activities, employment levels for the year remained relatively stable, showing a gradual decline as the effects of personnel shortages became felt.

Civil service reform scored added gains during the year, although at a slower rate than during peacetime years. Twelve cities and three counties adopted merit systems during 1943; in Georgia, three merit system agencies serving separate departments of the state service were combined. In Louisiana, on the basis of laws previously passed, merit systems became effective on Jan. 1 in the state service and in the New Orleans city service. Bills to establish civil service systems for state employment were introduced, but failed passage, in nine state legislatures. A recurring argument against them was that men in the armed forces would thereby be deprived of future employment opportunities. In the federal service, a congressional proposal that all positions paying more than $4,500 per year be subject to senate confirmation was defeated after sharp debate. Merit system supporters viewed the measure as a serious potential threat to the integrity of the federal civil service system. (J. J. DN.)

Clair, Matthew Wesley

(1865–1943), U.S. Negro clergyman, was born Oct. 21 in Union, W.Va. He studied classics and theology at Morgan college, Baltimore, graduating in 1889. He continued his studies at Bennett college, Greensboro, N.C., receiving a Ph.B. degree, 1897, and a Ph.D. degree, 1901. Ordained a Methodist Episcopal minister in 1889, he led several congregations, 1889–97, and then served as presiding elder of the Washington district, 1897–

1902. He became pastor of the Asbury church, Washington, D.C., in 1902, and when he resigned from this post in 1919 he had the satisfaction of leaving behind an $80,000 church edifice which had been built under his leadership. After a year as superintendent of the Washington district, Dr. Clair was elected a bishop in 1920 and assigned to Monrovia, Liberia. While there he was appointed to the board of education by Liberian President C. D. B. King. He served several years as bishop of Liberia, later held position as presiding bishop of the Lexington, Ky., conference, and then retired. He died June 28 at his home in Covington, Ky.

Clark, Mark Wayne (1896–), U.S. army officer, was born May 1 at Madison Barracks, N.Y., where his father, Col. Charles C. Clark, was then stationed. A graduate of West Point in 1917, he saw service on the Western Front in World War I and was wounded in June 1918. After the war, he was stationed with the army of occupation at Coblenz. He was graduated from the Command and General Staff school, 1935, and the Army War college, 1937. In Aug. 1942, he arrived in England to take over command of U.S. ground forces in the European theatre of operations, and in Nov. 1942, he was second in command of the U.S. forces that landed in North Africa. Three weeks before the invasion, General Clark and a group of U.S. officers were secretly landed on a coastal point in French North Africa. They established contact with French officers eager to co-operate with the United States and secured an agreement from these officers not to resist the American landings. He was awarded the distinguished service medal and the congressional medal of honour and promoted to a lieutenant general for this mission. He also headed negotiations with Adm. Jean Darlan for the cessation of all hostilities in Morocco and Algiers.

During 1943 he came more and more into prominence, as General Eisenhower's No. 1 U.S. field general. He commanded the U.S. fifth army in the invasion of Italy. In Dec. 1943, President Roosevelt, visiting Sicily on his return from Tehran, decorated him for "extraordinary heroism in action" at the landing at Salerno.

Clawson, Rudger (1857–1943), U.S. president of the Council of the Twelve Apostles of the Latter-Day Saints, was born March 12 in Salt Lake City. His father was an associate of Joseph Smith, founder of Mormonism. He studied at Deseret (now Utah) university and later served for 10 years as president of the Box Elder Stake at Brigham City. He was made a member of the Council of Twelve Apostles in 1898 and from 1910 to 1913 was head of the European mission. He was named president of the Council of Twelve Apostles in 1921. Clawson died in Salt Lake City, June 21.

Clays. There was a decrease of 13% in sales of kaolin in the United States in 1942, to 946,588 short tons, of which the paper industry used 59%. All major uses showed marked declines. Ball clay sales dropped 18% to 162,293 tons, of which 92% went into pottery and tile. Demand for industrial refractories led to an increase of 16% in the output of fire clay in 1942, to 4,839,332 tons, over 90% of which was used in refractories.

(G. A. Ro.)

Cleveland. Sixth largest city of the United States, Cleveland, O., had a population of 878,336 by the federal census of 1940. Area, 73.74 sq.mi. Mayor (Jan. 1, 1944): Frank J. Lausche.

Mayor Lausche was re-elected in Nov. 1943, by a record-breaking majority of 67,078, polling 113,032 votes while his Republican opponent, Edward C. Stanton, polled 45,954. His victory in the face of Republican gains elsewhere drew national attention to the Democratic mayor. At the same time there was elected to the city council a Democratic majority. Under the city charter Mayor Lausche began his new term Nov. 8, 1943.

Many municipal employees were granted pay increases to meet higher living costs. City council approved four salary ordinances which provided increases for hundreds of city employees. In Aug. 1943, the Cleveland board of education granted general pay increases to its employees, and in November the library board voted increases ranging from 6% to 8% to all Cleveland public library workers.

Manpower controls were tightened throughout 1943 in the Cleveland region as war industry expanded. In January the War Manpower commission through its Cleveland labour-management committee "froze" war workers to their jobs to prevent labour piracy. In May the minimum 48-hour work week went into effect and on Nov. 19 the War Manpower commission rated the city as an area of acute labour shortage.

Other events of 1943 included the following: Bishop Edward Francis Hoban on Jan. 21 became the first coadjutor in the history of the Catholic diocese of Cleveland. On May 20 the $20,000,000 aircraft engine research laboratory at Cleveland airport was dedicated. The Cleveland city council in June voted to change from eastern war time to the official state time, eastern standard time, beginning with the last Sunday in Sept. 1943, and to change back on the last Sunday of April 1944. In November the 1,700-bed United States general hospital in Parma Heights was completed. Births recorded in the city set an all-time high of 22,066 in 1943.

Products manufactured in Cleveland in 1943 were estimated to exceed $3,000,000,000 in value. Employment rose from 255,000 in 1942 to 287,000 in 1943. Arrivals of commercial vessels at the port of Cleveland totalled 3,217 in 1943, and of these 1,544 brought cargoes of iron ore.

The 1943 budget of Cleveland, prepared by Mayor Lausche, was $17,177,000, a reduction of $89,000 from 1942. County Auditor John A. Zangerle placed the valuation of land and buildings in Cleveland at $957,651,270 in 1943, compared with $923,907,830 in 1942. The Cleveland tax rate was $3.13 per $100 value. Indebtedness as of Jan. 1, 1943, was $127,289,751.65. (P. By.)

Climate: *see* METEOROLOGY.

Clothing Industry. The clothing industry marked time in 1943 in the United States. Conservation measures and shortages affecting civilian wear were generally continued. Government regulation of manufacture became more stringent with ceiling prices and other price orders used to force manufacturers into low-priced production. Rising costs of labour and materials with fixed price ceilings caught many in a squeeze; such producers sought to find loopholes to avoid ceiling prices. Renegotiation affected many military garment manufacturers.

There were no style changes in civilian garments except for a great increase in pile-lined cotton outerwear. There were numerous improvements in army and navy utility garments—mainly dictated by reports from the field of action; navy jumpers were made six inches shorter and the colour of navy officers' uniforms was changed to slate gray. Tremendous numbers of cotton herringbone twill garments were made for the army. Great strides were made in the development of cold weather clothing, emphasizing multiple layers of light weight; this was achieved primarily by the U.S. air force research section and was the result of observing dress habits of Eskimos and other far northern people.

New commercial standards covering finished garment measurements were accepted by the various divisions of the industry. War developments of importance to postwar garment operations were flame, water and mildew proofing. Manufacturers considered postwar plans and consolidation of their position.

The Amalgamated Clothing Workers of America, largest union in the industry, established a labour insurance fund consisting of a 2% levy on the manufacturers' gross annual pay roll and a 2% fund for paid vacations. Many manufacturers offered employees group life insurance and set up pension plans.

Fabric, trimming and finding shortages hampered the industry. New plastic buttons replaced metal on military garments. New machinery was available only on priority—a black market on textiles, trimmings, findings and machines was budding. Rayon production increased tremendously but was still far short of demand. Thread deliveries were slow and there was a marked demand for new ready-wound paper bobbins. Manpower and womanpower shortages were felt; manufacturers paid marked attention to efficient methods of production. Girls were taught marking, cutting and other duties previously performed by men.

New machines included a faster overseamer, a detachable turntable cloth laying machine for all types of napped fabrics and special variety machines for small complicated sewing operations.

Greatest civilian shortages appeared in children's wear, men's shirts and pajamas. Apparel rationing was avoided.

Comparing the first ten months of 1943 with 1942, civilian production was off 14% and military production up 74% in the men's, youths' and boys' woollen field. In the cotton, leather and allied garment industry the same comparison showed a drop of 24% in civilian production and a rise of 85% in military production.

British clothing manufacturers were engaged in a most conservative civilian program; rationing continued, business profits were off. Australian clothing was rationed. Germany stopped almost all civilian garment manufacture. Delivery of U.S. 32-oz. kersey overcoating and overcoats to Russia helped to defeat the Germans on the cold eastern front. (H. SN.)

MINERS leaving a coal shaft on April 30, 1943, the dead line set by John L. Lewis for a general strike. On the following day, the U.S. government took over operation of the mines, and Lewis directed the miners to return to work

Coal. **World Production.**—With no information available on coal production from any of the major producers except the United States, even estimates on world production for 1943 were impossible. It was thought that probably the reported output of 1,466,000,000 metric tons in 1939 had increased to something like 1,600,000,000 tons by 1941, but the figures were highly conjectural, and to attempt to extrapolate the conjectures to cover 1942 or 1943 seemed unwise. About all that could be said was that it was certain that all of the major producers, Germany, United Kingdom and the United States made the largest outputs that could be attained under the conditions prevailing. In Europe the only marked change in status during the year 1943 was the shift of Italy from the axis to the Allied Nations. As a partner in the axis, Italy received the necessary coal imports of some 1,000,000 tons monthly from German or German-controlled sources. It would now presumably fall to the United States to supply that portion of the country under Allied control with its fuel requirements, but since the major industrial areas of the country were still occupied by Germany, the bulk of the demand would still fall on Germany, if industrial production was to be maintained.

Total	1,559.00	1,124.00	1,550.00	1,469.00	1,466.00?

United States.—The coal output of the United States in 1942 included 580,000,000 tons of bituminous and 59,961,000 tons of anthracite, a total of 639,961,000 tons, and an increase of 12% over 1941. The bituminous total was a new record high, surpassing the former 1918 high by a small margin. Bituminous production was maintained throughout the year at an unusually

steady rate, varying little from a general average of 11,150,000 tons weekly, except at the end of June and at Christmas; anthracite output was somewhat less regular, with drops materially below the average in April, May, July and at the year-end. Consumption of bituminous coal increased 10% over 1941, to 540,726,000 tons, and stocks advanced 19% to 92,387,525 tons. Although the 1942 output was a marked increase over preceding years, it was still well under the potential full-time capacity of the mines, which is of the order of 685,000,000 tons, even on a five-day week basis, while a six-day week should give a potential output approximating 800,000,000 tons.

Table II.—*United States Production of Coal*
(Millions of Short Tons)

	1929	1938	1939	1940	1941	1942

West Virginia	138.5	93.3	108.4	126.4	140.3	156.8
Wyoming	6.7	5.2	5.4	5.8	6.6	8.0
Others	32.1	22.1	21.7	23.7	24.8	28.3
Total Bituminous	535.0	348.5	394.9	460.8	514.1	580.0
Anthracite	73.8	46.1	51.5	51.5	56.4	60.0
Grand Total	608.8	394.6	446.3	512.3	570.5	640.0

In 1943, both bituminous and anthracite were on a par at the end of November with the same period of 1942. Through the week ending Nov. 27, 1943, the bituminous total was 529,020,000 short tons and the anthracite total 54,937,000 tons, making a grand total of 583,957,000 tons, as compared with 583,813,000 in the same period of 1942. These figures indicate that production for the full year would not differ appreciably from the 1942 totals of 580,000,000 tons of bituminous and 59,961,000 tons of anthracite, but were likely to run slightly over these figures. Production during 1943 failed to keep pace with consumption, with the result that stocks were depleted to make up the deficit. By the end of September industrial and retail stocks had dropped from 85,889,000 tons to 72,866,000 tons, and those at Lake docks shrunk from 6,993,030 tons to 5,248,018 tons.

This unfavourable showing by the coal industry of the country during a year that should have produced the maximum output of which the mines were capable was the result of a recurring series of strikes in the industry. Some of these were "authorized" by union officials, and some were "unauthorized," but all were equally in violation of union pledges to refrain from strikes during the period of the war. Net results were, for the miners, an increase in pay to cover travel time, and overtime pay to cover the change from the five-day to a six-day week, and for the country a loss of coal output that was estimated by the Solid Fuels administration at 40,000,000 tons, which seems to be a rather conservative figure.

Coal requirements for 1943 had been estimated at 665,000,000 tons; production would be only about 640,000,000 tons; without the strikes the estimated requirements could have been met, and even exceeded, avoiding a shortage that had not only adversely affected industrial and munitions output, but also necessitated such stringent restrictions on domestic fuel that the householder who a year before converted his heating system from oil to coal stood a good chance of having a harder time to keep warm with coal than with oil. (*See* also FUEL BRIQUETTES.)

(G. A. Ro.)

Great Britain.—During the autumn of 1942 there were widespread fears that a fuel crisis would develop during the late winter and early spring. Estimates by the ministry of fuel and

COAL PRODUCTION OF THE WORLD and the major producing countries, as compiled by *The Mineral Industry*

power indicated that the consumption of coal would exceed production by 11,000,000 tons. The only factors that could save the position were mild weather, decreased consumption or increased output. Luckily the winter was mild because production in fact decreased though it exceeded the ministry's estimate by 3,000,000 tons. Increased efficiency in industrial consumption combined with economy to the point of hardship by the private householder sufficed and the gap was closed, the economies equalling 11,000,000 tons.

During 1943 production at the mines further declined and consumption increased in spite of greater efficiency in fuel consumption. In addition the liberation of North Africa, capture of the Italian islands and part of Italy itself created additional demands. How these were to be met without depriving Britain of power and warmth was the problem the ministry of fuel and power had to solve, either by increased manpower or increased output per man already employed.

Manpower can be divided into three categories—producers, transport hands and surface workers in approximately equal proportions. Of these the producers are on average the younger and more virile men, the very men who flocked into the army at the outbreak of war and after Dunkirk and who make excellent soldiers. Here was the greatest shortage. All through 1943 attempts to meet the annual wastage of some 20,000 men and especially to increase the number employed at the coalface were made by upgrading junior categories, by direction by the ministry of labour and by recalling men from civilian war work. It was found impossible to release more than a very limited number from the fighting services. Special efforts were made to recruit boys and youths by monetary inducements and the extension of pre-entry training schemes, but without any real success. At the close of 1943, the ministry of labour and national service decreed that any man, when called up for national service, could be directed *pari passu* either into the armed forces or the mines.

To effect increased output from the men already employed certain mines were closed and the employees directed to work in other mines where coal-getting conditions are better. It was expected that an additional 1,000,000 tons would be produced by this means. All the mines in the country were examined by officials and attempts were to be made where underground conditions are suitable to introduce American mechanical loading machinery. But this would mean the adoption of a method of mining which can only be used safely in a limited number of mines.

Some success was expected to meet the efforts of British mining engineers to produce loading machines suitable for established British mining methods. Mechanization had been carried to a high pitch already; nearly 70% of the coal produced was mechanically cut and conveyed but there was a gap in the complete mechanization cycle; all coal, after being broken mechanically, had to be loaded on to the conveyors or into trams by manual labour.

Opencast mining was progressing and over 2,000,000 tons were produced in 1943. In 1944 by means of additional machinery this amount was expected to be doubled or even trebled.

The bonus scheme based on output—that every man employed in every mine in a given coalfield gets a bonus of 3*d.* per shift for every 1% the coalfield output exceeds an agreed standard amount—had a full trial and did not prove the success hoped. The scheme, envisaging a whole coalfield, was too impersonal. It was therefore proposed to apply the scheme to individual mines.

On June 30 all coal became by purchase the property of the state and was vested in the Coal Commission, the purchase price being £66,666,000.

The British Coalowners association assisted by the department of scientific and industrial research decided to spend £200,000 per annum for five years on research with the object of increasing efficiency in the use of coal as a fuel and ultimately to find such uses for raw coal that it would cease to be regarded as a fuel and would be looked upon as a raw material for subsequent processing. (J. A. S. R.)

Minor Producers.—In Canada the coal production in 1942 was 18,707,100 short tons, as compared with 18,225,900 tons in 1941, and a new record figure. The value of the output, however, increased by 7%, against 2.6% rise in quantity. The total included 13,541,000 tons bituminous; 726,300 tons of sub-bituminous; and 4,439,800 tons of lignite. Imports of coal into Canada in 1942 included 20,807,005 tons of bituminous and 4,802,023 tons of anthracite, a total of 25,609,267 tons, an increase of 17% over 1941. Exports in 1942 were 815,585 tons, leaving a balance of 43,500,000 tons available for consumption. In order to develop the maximum output, subsidy payments were being made to mines requiring assistance in meeting increased costs of operation. Production during the first three quarters of 1943 was 13,126,656 tons, a decrease of 6% from the same period of 1942, but the drop was more than offset by imports of 20,432,551 tons, up 11% from 1942.

Chilean production amounted to 2,069,000 metric tons in 1942, and 704,000 tons in the first four months of 1943.

The Spanish output declined slightly, to 8,772,000 metric tons in 1942 as compared with 8,844,000 tons in 1941, but rose to 3,116,000 tons in the first four months of 1943. (G. A. Ro.)

Coast and Geodetic Survey, U. S.

Hydrographic surveys and charting of waters of the western Aleutian islands, together with geodetic control work in Alaska and Yukon territories, were the principal accomplishments of the U.S. coast and geodetic survey in 1943. Four ships of the survey's fleet were operated by the bureau to meet the immediate needs of the Alaskan sector command and one vessel was assigned directly to the commander of the north Pacific force. The work performed by the personnel of the survey ships contributed to the success of naval missions and the safe transportation of military personnel and equipment in these previously uncharted waters. A fifth survey vessel was engaged in southeast Alaska on the approaches to important base ports.

Through the co-operation of the U.S. coast guard, which furnished an amphibian plane and crew to fly the 9-lens camera, the coastal area of the Alaskan peninsula adjacent to Bristol bay was photographed for mapping. Later, all except two of the personnel of this party were killed while on an aerial photographic mission in the western Aleutians, when the plane crashed into Adak mountain and was destroyed. The accident, a major casualty attributed to war conditions, occurred shortly prior to the attack on Kiska island when survey work was being concentrated on the collection of data to assist in that action.

Geodetic control surveys were made from Seward peninsula along the shores of Bering sea to the lower Yukon river valley and from Tanana Crossing through Yukon Territory and British Columbia to southeast Alaska at the summit of White pass. The work included triangulation, levelling and astronomical observations of the first order of precision.

Within continental United States, survey ships were engaged on projects in coastal areas for naval purposes. Geodetic control was provided, and aerial photographic and ground surveys were made for military mapping. Tidal measurements were obtained and predictions of future tidal movements were prepared for military areas. The direction and velocity of currents in three restricted channels on the Atlantic coast were measured.

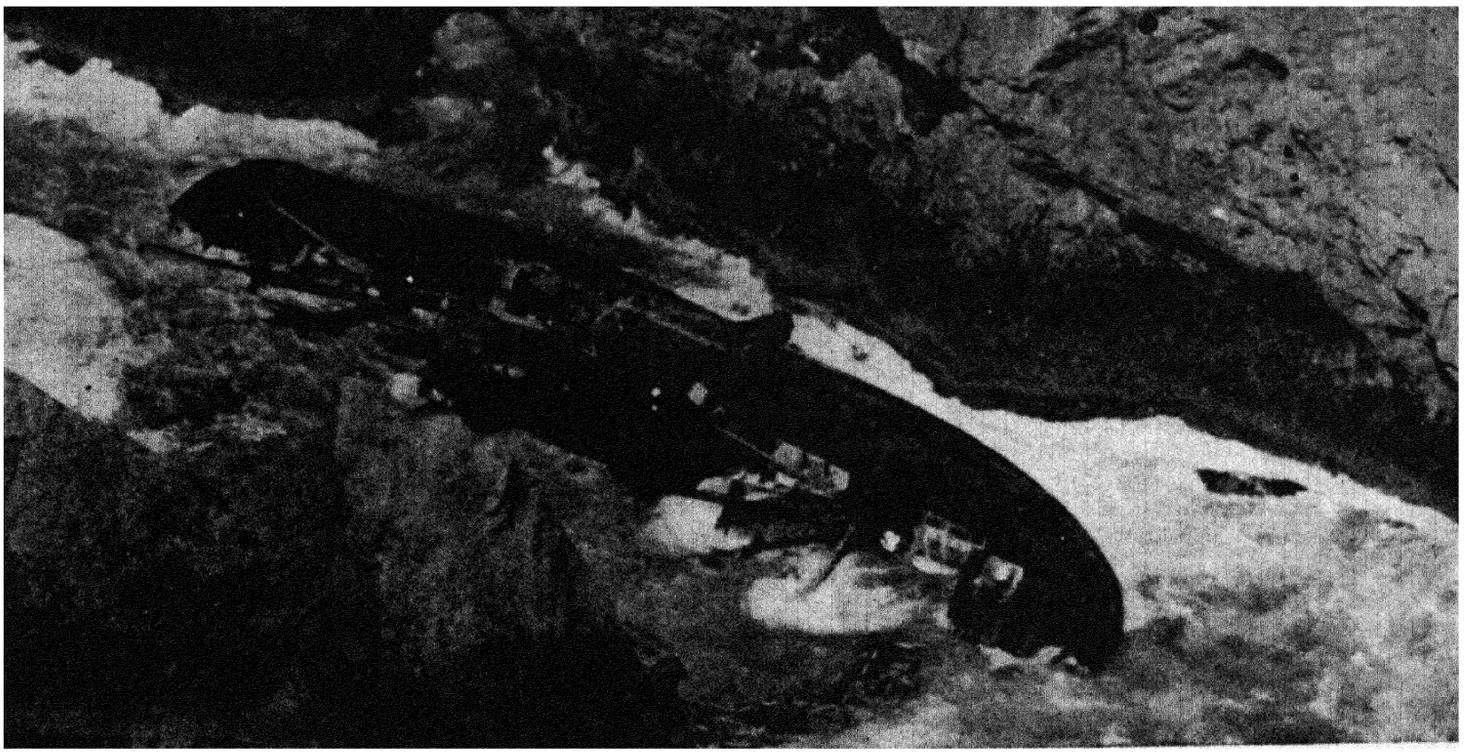
Analysis of geomagnetic observations and seismic records was continued. Isogonic lines were either determined from observations or extrapolated from available information for use on air maps of the hemisphere. Magnetic declinations were furnished for use on military quadrangles.

The production of nautical and aeronautical charts reached a new record at the close of the year. Naval operations and marine concentrations in all coastal waters required the issue of over 2,250,000 marine charts to navigators of ships of the United States. Training programs and domestic operations of the air forces and accelerated aviation activities were reflected in the issue of 15,000,000 aeronautical charts. (L. O. C.)

Coast Guard, U.S.

Characteristic of the U.S. coast guard's activity during 1943 was the continuance of its operational integration with the navy, of which it had been a part since Nov. 1, 1942. In 1943 the coast guard participated through its enlarged and more combatant operative arms with the other services on an unprecedented scale, collaterally maintaining all phases of its peacetime functions.

Most closely integrated with the navy were the larger coast guard vessels operating offshore as units of fleets, task forces and various sea-frontiers, performing duties as escorts of convoy and antisubmarine patrol in addition to continuing highly specialized work peculiar to the coast guard such as that in Greenland. Greatly determining the coast guard's operations in 1943 was the navy's landing craft and amphibious warfare program, in which the coast guard figured to a great degree, manning and operating numerous units of the amphibious fleets.



Not only were the warships of the coast guard engaged in 1943 in offensive actions but also they continued their traditional role of safeguarding lives at sea. During 1943 this consisted principally of rescue of personnel surviving hostile submarine action, although rescues were not confined strictly to deepwater, lifesaving in floods and other disasters far inland being examples.

The year 1943 saw the intensification of that part of the coast guard devoted to aids to navigation, including buoy tenders which worked in extremely close liaison with the navy in establishing and maintaining mine fields and navigational aids in waters surrounding newly established bases outside the continental limits, and lightships and district craft performing similar duties in domestic waters.

Units of the service ashore continued their preventive and remedial duties, with the effectiveness of lookout stations bolstered by especially trained beach patrols working with dogs and horses to facilitate the vital maintenance of security.

Coast guard air activities were enlarged in 1943, with emphasis placed on flying antisubmarine and personnel assistance and rescue sorties. Air field and base installations were also enlarged as part of the general policy of extending this activity's scope.

Enlargement of United States shipping fleets and maritime

WHEN THIS RUSSIAN FREIGHTER ran aground on the U.S. northwest coast early in April 1943, coast guardsmen made their way through miles of dense forest to reach the wrecked ship and rescue the crew. The rescue party is barely visible in the upper right centre of the picture

personnel in 1943 resulted in a like expansion of the coast guard's program for the administration of the bureau of marine inspection and navigation, most functions of which were transferred to the coast guard from the department of commerce. Within the year the coast guard fostered the widespread application of safety equipment aboard merchant vessels and the instruction of merchant seamen in the proper use thereof.

Connected with the huge logistics movements resulting from the prosecution of the war in 1943 was the coast guard's preoccupation with the exacting task of waterfront protection and maritime law enforcement. More fully than ever before the coast guard in 1943 was charged with the supervision of the loading of explosives and kindred cargoes, the safeguarding of waterfront, canal and important inland waterways from destruction, loss, sabotage and natural disasters. In 1943 the nation's largest fire-fighting fleet, operated and administered by the coast guard, practically and statistically proved its value.

Personnel expansion of the coast guard was consistent with the service's enormous material growth. At the start of 1943, 140,000 persons were enrolled in the regular and regular reserve establishments. At the end of the year this force had been enlarged to 165,000 officer and enlisted personnel. Subordinate commands included 34,000 members of the coast guard temporary reserve, augmenting the coast guard auxiliary and bringing the total of temporary reservists to 62,000 officers and men. At the end of 1943 the coast guard auxiliary police and the newly recruited coast guard volunteer port security force were playing important roles in maintaining security measures and also in releasing regular coast guardsmen for combatant duty.

To meet the exigencies and demands of coast guard fleets, new ratings and new ranks for officer and enlisted personnel were initiated, prompted also by the requirements of the enlarged military organization and especially by the necessity of manning the invasion landing craft.

For the first time, in 1943, voluntary enlistments in the coast guard were curtailed and then abolished. In lieu of traditional procedures, men were accepted for coast guard service after induction through the machinery of selective service. Receiving more emphasis than ever before, the policy of procuring officers from candidates in the enlisted ranks was inaugurated.

(R. R. W.)

Women's Reserve (Spars).—SPARS are members of the women's reserve of the United States coast guard reserve. The word SPAR was compounded from the coast guard motto "Semper Paratus" ("Always Ready"). SPARS were enlisted for the duration of World War II and six months thereafter, to take over coast guard jobs ashore so that more coast guardsmen might be released for sea duty.

The coast guard's women's reserve was originated by Public Law 773 of the 77th congress. Director of the SPARS in 1943 was Lieutenant Commander Dorothy C. Stratton, former dean of women and psychology professor at Purdue university.

The women's reserve may enlist up to 10,000 women under its 1944–45 program. To enlist, a woman must be an American citizen from 20 to 36 years old, with at least two years high school or business school education. If married, she may have no children under 18 years old, and her husband may not be in the coast guard. An applicant for officer training, must fill the same qualifications with two exceptions. The officer age limit is extended to 50 years. Educational requirements specify a college degree or at least two years of college plus two years of business or professional experience. Officer candidates are trained at the Coast Guard academy, New London, Conn. They receive commissions after completing this course.

Enlisted SPARS train at the Coast Guard Training station, Palm Beach, Fla. They become seamen, second class, after a six-weeks basic training period. Those who successfully complete further training in specialty schools are assigned to duty as petty officers.

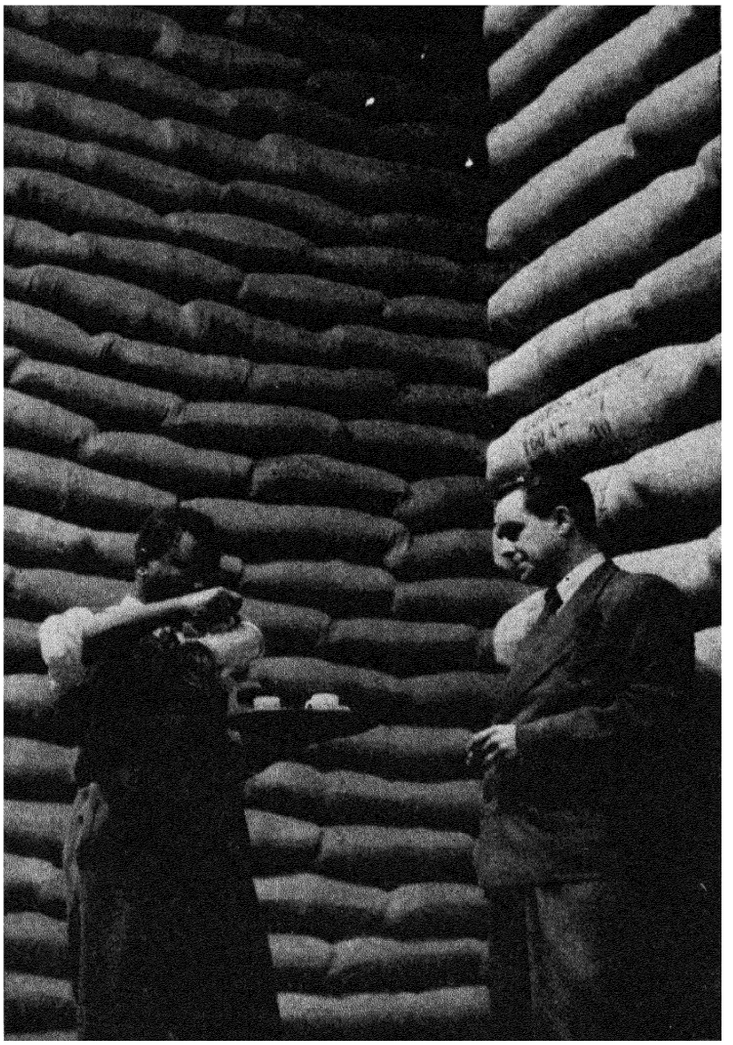
During 1943 approximately 6,000 enlisted SPARS and 500 officers were trained and placed on the job. Enlisted personnel served in the following specialty ratings: yeoman, storekeeper, cook and baker, pharmacist's mate, radioman, photographer's mate, coxswain, commissary steward, gunner's mate, quartermaster, bugler and carpenter's mate.

(D. C. Sn.)

Coates, Joseph Gordon (1878–1943), New Zealand statesman, was born in Matakohe, N.Z. He had been active in public life for over 30 years,

held various cabinet posts during that time and was premier from 1925 to 1928. He was named to the New Zealand war cabinet in 1940 and in that capacity went to Washington in the following year to organize the munitions supply for dominion defense. He became minister of armed forces and war co-ordination in July 1942. Mr. Coates died in Wellington, N.Z., May 27. (See *Encyclopædia Britannica.*)

Cobalt. Little was done in the way of cobalt production from domestic ores in the United States, aside from a small by-product recovery, but after 1940 the Belgian Congo residues were shipped to the United States for treatment, and there was in 1943 a moderate amount available from Canada. World output was unofficially estimated at 6,000 metric tons, mostly from Belgian Congo and Northern Rhodesia. The use of the metal in high-speed steels and permanent magnets has materially increased consumption during the war years.



(G. A. Ro.)

Cochin-China: *see* FRENCH COLONIAL EMPIRE.

Cocoa (CACAO). The supply of cocoa from Latin America and Africa appeared to be ample according to unofficial sources. The official statistics were held in confidence by the Combined Food board which had the responsibility of making allotments in 1943. Production of cocoa in West Africa was large and the surplus growing due to lack of shipping. There was said to be more than 300,000 tons available if ships could be had to transport it. The united supply came principally from Brazil which had a production for export of about 600,000 tons in 1942–43 and somewhat less in 1943–44. Next to Brazil in importance were the Dominican Republic, Ecuador and Venezuela. With the restricted manufacture of chocolate due to sugar control, the available supplies from Latin America plus about 150,000 tons from Africa provided a sufficent quantity to build up supplies in 1943. The supplies of chocolate and other forms of cocoa in retail markets were maintained through 1943 at about the same level as in 1942. (J. C. Ms.)

Coco-Nuts. Imports of coco-nuts were limited to such supplies as could be shipped from Honduras in 1943 and some very small quantities from other sources. The official statistics on imports were held as confidential by the government. Lack of ships was the limiting factor. Supplies which formerly came from the Philippines and East Indies were practically exhausted. Production was encouraged in Latin America but increased very slowly and the increase was principally in Honduras. (J. C. Ms.)

Coffee. The end of coffee rationing in the United States in July 1943 was not followed by a rush to buy coffee as expected, since almost 90% of the requirements had been supplied under rationing. Consumers had developed more economical use of the product and also appeared to have saved stocks in anticipation of more severe rationing. According to figures released by the treasury department, census bureau, the amount of coffee imported for consumption from Oct. 1942 to Sept. 1943 inclusive was as follows: Brazil, 898,000,000 lb.; Colombia, 635,000,000 lb.; El Salvador, 120,000,000 lb.; Guatemala, 107,000,000 lb.; Mexico, 65,000,000 lb.; Costa Rica, 40,000,000 lb.; Venezuela, 67,000,000 lb.; Haiti, 56,000,000 lb. and other Latin American countries about 90,000,000 lb. Brazil continued to produce heavily and found it necessary to continue to purchase and destroy much of the lower quality coffee to aid her producers. Shortage of shipping space was the only factor that prevented the United States having an ample supply at all times.

COFFEE BOY pouring a drink for an official of the Brazilian national coffee department at a warehouse in Ypiranga. Before rationing was removed in the United States July 1943, Brazil accumulated huge surpluses

With the improvement of shipping to Latin America in 1943 the imports under the coffee agreement were readjusted and a larger supply provided to meet the expected increase in consumption with the absence of rationing. The subsidy on the import of coffee was ended on Aug. 25, 1943. In the coffee trade the problem in late 1943 was to buy high quality coffee at ceiling prices, even with the large supplies available. Unofficial estimates of 1942–43 production was that the total crop of all countries accessible to the United States was about 1,308,160 short tons, including 660,800 tons from Brazil; 249,760 tons from Colombia; 56,000 tons from El Salvador and 53,760 tons from Guatemala as the largest producers. (*See* also BRAZIL; GUATEMALA; RATIONING.) (J. C. Ms.)

Coinage. The mint establishment of the United States, an instrumentality of the treasury department, during the calendar year 1943 found it necessary to continue the previous year's high rate of coin production in order to meet the augmented needs of the populace for fractional coins to implement exchanges occasioned by the great amount of business and war-effort activity. The three coinage mints, in Philadelphia, Pa., San Francisco, Calif., and Denver, Colo., were operated throughout the year on a three-daily-shift basis, with production of 2,023,898,270 pieces of domestic coin, having a value of $136,237,136.70, and of 186,682,000 pieces of coin for foreign governments. This output was the largest during any calendar year of mint history. Domestic coin production by denominations, follows:

Half dollars	77,986,000 pieces
Quarter dollars	137,495,600 pieces
Dimes	324,059,000 pieces
Nickels	390,519,000 pieces
Cents	1,093,838,670 pieces

Coinage of the zinc-coated-steel one-cent piece was begun in Feb. 1943, and discontinued at the end of the calendar year. Arrangements were completed for it to be immediately succeeded by a copper coin made from 95% copper and 5% zinc, with a weight of 48 grains, but without other changes. The over-all output of the zinc-coated-steel cent was 1,093,838,670 pieces, having a value of $10,938,386.70.

The other mint service institutions consist of the assay office at New York with auxiliary silver bullion depository at West Point, N.Y., whose principal activities consist of receiving, valuing, refining, storing and issuing gold bullion and silver bullion, as affected by domestic production, import, export, and consumption of these metals; the assay office at Seattle, Wash., a bullion purchasing agency; and the gold depository at Fort Knox, Ky., a storage institution.

The augmented industrial role assigned to silver bullion resulted in use of considerable quantities of treasury silver, in lieu of copper, as bus bars for transmission of electric current, or otherwise, in plants engaged in war activities. Government-owned silver bullion in material quantities was sold or lend-leased for use in aiding the war effort, including the making of munitions of war and the supplying of industrial needs. The lend-leased bullion was to be returned, in kind, after the war's close.

An unusual activity of the year 1943 was the conversion, under legislation approved Dec. 18, 1942, of millions of worn and uncurrent silver dollar coins previously held in storage, to fractional silver coin for use in active circulation. This also conserved copper and silver, for use in war activities. (N. T. R.)

Coke. The production of coke in the United States in 1942 increased by 8% over 1941, with 62,294,909 short tons of by-product coke and 8,274,035 tons of beehive coke, a total of 70,568,944 tons, besides 4,751,683 tons of breeze or screenings. This production of coke required 17% of the year's output of soft coal, the total charged into the ovens being 100,849,633 tons. During the year the number of ovens decreased from 31,685 to 29,598, with 1,327 additional ovens under construction at the end of the year. The capacity of the ovens in use at the end of the year was 74,963,567 tons per year. The largest consumer of the coke was the iron blast furnace, which took 79% of the total; domestic use took 9%, gas production 8% and foundries 4%.

Production during the first 10 months of 1943 totalled 59,411,000 tons, an increase of 2% over the same period of 1942. On this basis the total for the year was expected to be somewhere between 71,000,000 and 72,000,000 tons. Except for the series of coal strikes during the year, the 1943 total might have been expected to approach 73,000,000 tons.

No information was available from the other important coke-producing countries, which in order of importance were in 1942, Germany, Great Britain, U.S.S.R., France and Belgium.

(G. A. Ro.)

Cold, Common. Common colds occur in the United States with greatest frequency in three principal periods—January and February, April and May and September and October. The peak in January and February is the most serious as measured by absence from work and severe complications. The common cold is highly contagious and is responsible for an enormous amount of industrial absenteeism. Many measures were under investigation for the control of epidemics of this disease and to prevent its spread. Unfortunately cold vaccines whether given by injection, by mouth, or by inhalation failed to achieve general acceptance and satisfactory proof of the value of any of them was so far lacking. It was claimed by some that vitamins help to reduce the frequency and severity of colds but carefully controlled studies of this subject did not corroborate this view. Vitamins do not seem to prevent colds, shorten them or make them milder although they do have an effect on the general health. Some progress was made toward minimizing the complications of the common cold. Some of the drugs of the sulfonamide group when administered by spray or by mouth have been reported as exerting a definite effect on reducing the complications in some persons. It was not recommended that all persons with colds take sulfonamide drugs but those who are especially susceptible to late complications such as sinusitis might obtain favourable results. Considerable work was done in 1943 on the sterilization of air by various means so that the virus causing the common cold is not spread as readily or as rapidly. In a children's hospital ultraviolet radiation was found to be effective in cutting down the frequency of respiratory infections in the wards. A vapour made up of propylene glycol and other so-called aerosols also was found useful in reducing the incidence of respiratory infections in certain enclosed spaces such as hospital wards or air raid shelters. Further work along this line appeared highly promising and might reduce colds and other cross infections under certain circumstances.

Colles, Henry Cope (1879–1943), British music critic and author, was born April 20 in Bridgnorth, Salop., England. He studied at the Royal College of Music, London, and at Worcester college, Oxford, receiving his B.A. degree in 1902 and his B.M. in 1903 from the latter school, where he was an organ scholar. He became a lecturer in musical history and taught music and criticism at the Royal College of Music. In 1924 he was made a member of the associated board of the Royal Academy of Music and the Royal College of Music. For over 30 years he was music critic of the London *Times*. Mr. Colles edited the third edition of Grove's *Dictionary of Music and Musicians* (1927) and the fourth edition with supplement in 1940. His other publications include *Brahms* (1908); *The Growth of Music*, Part I (1912), Part II (1913), Part III (1916); *Voice and Verse* (1928); *The Chamber Music of Brahms* (1933); and *Oxford History of Music*, vol. 7 (1934). He died in London, March 4.

Colombia. A republic of northwestern South America, lying between 12° 24′ N. lat. and 4° 17′ S. lat.; it is the only South American country with a littoral upon both the Caribbean and Pacific. Area: 439,714 sq.mi.; pop. (1938 census) 8,701,816. An estimated 7% of the population is Indian, 5% Negro, 68% mixed blood, 20% white. The bulk of the population lives in the great interior valleys and highlands. The capital is Bogotá (325,658); other cities are: Medellín (143,952), Barranquilla (150,395), Cali (88,366), Manizales (51,025), Cartagena (72,767), Ibagué (27,448), Cúcuta (37,323), Bucaramanga (41,714), Pasto (27,564), Santa Marta (25,113), Neiva (15,096), Popayán (18,292). Language: Spanish; religion: Roman Catholic. President in 1943: Dr. Alfonso López.

History.—The Liberal administration of President López maintained control of policy in 1943. In the March congressional elec-

tions the administration Liberals retained 60 seats in the house, the Conservatives held 50 and dissident Liberals 13. Since the Liberal forces won 13 of the 14 state elections, their position was much stronger in the senate. (Senators are chosen in Colombia by the state legislatures.) New cabinet appointments were made in August, shortly after the convening of congress, and in September and October the cabinet had to be reconstituted three times, largely because of inter-party quarrels over a future presidential candidate. In addition the administration was embarrassed by a serious transportation strike in the department of Caldas, which was accompanied by riots and which necessitated the declaration of martial law in the district, and likewise by a scandal in the Bogotá police department, involving high officials. On Nov. 16 President López requested a 90-day leave in order to take his wife to the United States for medical attention. He left Colombia on Nov. 24, with Vice-President Dario Echandia taking over the executive office in his absence.

Colombia finally joined the ranks of the belligerent Allied nations on Nov. 1, declaring war because of the sinking of a Colombian vessel by submarine attack. The new status involved no great change in policies already actively pro-Allied in sentiment.

In international affairs Colombia improved its relationships in two cases. At the start of 1943 a concordat with the Vatican was approved, by which Colombia will exercise the right of approval of episcopal appointments (which were limited to Colombian nationals), and by which church weddings are to be recognized by the state, but under provision of registration with the civil authorities. On Feb. 9 it was announced that Colombia was to resume diplomatic relations with Russia; in the summer Alfredo Michelson was named as Moscow representative for Colombia.

Inter-American co-operation, a definite part of the administration program, continued along lines inaugurated in 1942. The Ninth Inter-American conference, which was to have been held in Colombia late in 1943 (the last meeting was held in Peru in 1938) was indefinitely postponed because of the war. An Inter-American School of Meteorology was opened in Medellín early in the year. In August the Colombian foreign office proposed that all South American states who had severed relations with the axis, but who had not yet entered the war, should enter into consultation to plan future relationships with the United Nations.

Effects of the war were felt in Colombia in 1943 in a continued rise in living costs and in shortages of manufactured items and some foodstuffs and raw materials. Abnormal accumulation of gold and foreign exchange took place, with a corresponding increase in note circulation (85,040,000 pesos in Aug. 1942 as against 108,488,000 a year later). On March 2 an economic plan was adopted, which embodied price control, particularly on food and drugs, an encouragement of co-operatives, a modification of the exchange control system, the establishment or reorganization of important government bureaus, and a plan for nationalization of foreign-owned properties of a public utility nature. This economic program supplemented an earlier one (Dec. 1942) which had inaugurated a plan of forced investment in government bonds. An $18,000,000 Export-Import bank loan was concluded during the summer, with $10,000,000 earmarked for stimulation of essential agricultural projects, and the remainder for highway construction. The government continued to favour co-operatives as a means of improving economic conditions; at the beginning of 1943 Colombia had approximately 200 of them, of all types, with a capital of over 10,000,000 pesos.

An unpopular law enacted in 1942, and requiring all foreign firms to retain a Colombian legal representative, was repealed in January.

Education.—The school system (1942) consisted of some 9,000 primary and 450 secondary schools, with a total enrolment of more than 700,000. The 1943 budget allotted 7,268,209 pesos to education (1942: 7,735,000 pesos).

Finance.—The monetary unit of Colombia is the peso (official value in Dec. 1943, 57 1/7 cents U.S.). Revenue for the first nine months of 1943 was 52,865,000 pesos (same period in 1942: 52,847,000 pesos). Expenditures for the same period were indicated as being 63,904,000 pesos, a deficit of 11,039,000 pesos. Total notes in circulation Sept. 30, 1943, amounted to 108,869,072 pesos.

Trade and Communication.—Colombian foreign trade for the first half of 1943 totalled 179,258,000 pesos (total trade for 1942 amounted to 296,884,000 pesos). Imports were valued at 66,537,000 pesos; exports at 112,721,000 pesos. Coffee exports for the period were valued at 88,285,000 pesos; petroleum at 4,663,000 pesos. No gold was exported. Colombian trade with leading countries for the first half of 1943 was as follows: United States, exports to: 77,320,000 pesos, imports from: 31,250,000 pesos; United Kingdom, exports: 250,000 pesos, imports: 3,460,000 pesos; Argentina, exports: 515,000 pesos, imports: 5,300,000 pesos; Brazil, exports: 1,600 pesos, imports: 4,050,000 pesos. The Colombian favourable trade balance with the United States amounted to $42,702,000.

Maritime communication improved in 1943. Railways cover 2,053 mi., and 7,700 mi. of improved highway, 35,450 mi. of unimproved highway aid in transportation. Boat service on Colombian rivers is important. Construction on a 512-mi. road designed to open rubber-producing areas near the headwaters of the Orinoco river was reported.

Agriculture.—Agriculture is the basic Colombian industry. Coffee is the principal item; 3,880,000 bags were exported in the 1942–43 quota year (18% over the previous year, but 17% under quota allowance). The Colombian quota was increased by 1,631,111 sacks in March 1943. Sugar production for 1942 (official estimate) was 71,800 short tons; rice production (1941) was 119,841,300 kgs., not enough for home consumption.

Mining.—Petroleum production in 1942 amounted to 10,590,000 bbl. (1941: 24,629,000 bbl.). The reduction in 1942 was largely due to the shortage in tankers. In the first eight months of 1943 petroleum output was 7,789,000 bbl. Other minerals produced (1942) were: gold, 596,618 fine oz.; platinum, 55,543 fine oz.; silver, 151,084 fine oz.; asphalt, 73,253 bbl.; salt, 40,490 short tons; cement, 229,050 short tons.

BIBLIOGRAPHY.—J. M. Henao and G. Arrubla, *A History of Colombia* (transl. by J. F. Rippy, 1938); *Foreign Commerce Weekly* (Washington).

(D. RD.)

Colorado. A Rocky mountain state of the United States, in the west-central part; mean elevation above sea level, 6,800 ft. Admitted to the union in 1876 as the 38th state and known as the "Centennial state." Area 104,247 sq.mi., including 280 sq.mi. of water surface. Population (1940), 1,123,296; 52.6% urban, 47.4% rural; 93.6% native, 6.4% foreign born; white 98.5%, Negro 1.1%, other .4%; 102.6 males per 100 females. Capital and largest city, Denver (322,412). Other cities: Pueblo (52,162); Colorado Springs (36,789); Greeley (15,995).

History.—John C. Vivian (R.) was elected governor Nov. 3, 1942. Other officers elected were: lieutenant governor, William E. Higby (R.); secretary of state, Walter F. Morrison (R.); auditor, James L. Bradley (R.); treasurer, Leon E. Lavington (R.); attorney general, Gail L. Ireland (R.); superintendent of public instruction, Mrs. Inez Johnson Lewis (D.). Walter F. Morrison resigned in 1943 and L. J. Bennett was appointed to unexpired term as secretary of state.

Education.—In 1941–42 total elementary and secondary enrolment was 225,967; average attendance was 189,433 in public schools and 7,229 enrolled in parochial schools. Total number

of teachers: public schools 9,488, parochial 479. Average salaries paid teachers were: elementary schools $1,133, junior high $1,902; senior high $1,590; average $1,390.

The legislature in 1943 provided for additional state aid to schools by earmarking 15% of the state income tax to be distributed to school districts in counties where matching funds were made available by special school district and county wide property tax mill levies. This aid provides for a minimum of $1,000 for each elementary classroom unit and $1,333 for each high school classroom unit. At the beginning of the fall term in 1943, there was a 10% shortage of teachers. This was alleviated somewhat by the granting of 1,200 war emergency teaching certificates and by the transportation of school children to other than their own districts.

Public Welfare, Charities, Correction.—Public welfare disbursements in 1942, including $9,627,590 in federal grants, amounted to $23,474,273. Pensions, 42,676 persons over 60, $18,129,098; dependent children, 5,734, $1,585,631; blind, 637, $205,939; direct relief, 9,657, $1,722,475; child welfare, 1,372, $44,676; tuberculosis, 192, $92,697; of these amounts the state supplied 50%, federal 47%, and county 3%; unemployment insurance: 350,000 insured in 1942; 75,076 checks totalling $826,307 in benefits. There were four correctional institutions with 1,961 inmates and annual disbursements of $1,062,287; eight charitable institutions, with 6,314 inmates and annual disbursements of $2,307,085.

Communication.—The state highway system in 1943, including 3,995 mi. of federal aid primary, and 1,982 federal aid secondary roads, totalled 12,399 mi.; city streets, 3,491 mi.; county roads, 36,176 mi.; other local roads, 26,423 mi.; national forests, 788 mi.; toll, 8 mi.; total, 79,285 mi. Thirty railroads had 4,507 mi. of main line track. There were 37 airports and landing fields. Number of telephones, in excess of 270,000.

Banking and Finance.—As of Jan. 1943 there were 78 national and 62 state banks; total deposits, $564,101,579, assets, $593,903,986; 23 federal and 29 state savings, building and loan associations, with assets of $39,590,528.

The state property tax was reduced from 4.35 mills to 4.25 in 1941, to 4.00 in 1942 and to 3.85 in 1943. The biennial state budget for 1941–43 was $120,967,319; for 1943–5, $130,000,000. The surplus in state treasury Nov. 30, 1943, was $5,388,774; in state institutional postwar building funds $1,628,621.

Agriculture.—In 1943 acreage planted increased by 3.5% and acreage harvested by 5% over 1942. Farm crops were harvested from 6,111,000 ac., or 9% of the state area. Cattle, sheep, and hogs marketed increased by a substantial percentage. Total income from marketing of agricultural, livestock and livestock products was estimated at $330,000,000, of which slightly less than half represented agricultural products. The increase over 1942 was 40%. At the end of 1943 the number of cattle was 10% higher, sheep 5% and hogs 25% over Dec. 31, 1942.

Table I.—*Leading Agricultural Products of Colorado, 1943 and 1942*

Crop	Unit	1943 (est.)	1942
Wheat	bu.	31,540,000	27,406,000
Corn	"	14,430,000	18,228,000
Barley	"	17,616,000	15,816,000
Oats	"	5,355,000	5,647,000
Dry beans	100# bags	3,118,000	1,903,000
Sugar beets	tons	1,623,000	2,178,000
Tame hay	"	1,817,000	1,856,000
Potatoes	bu.	18,705,000	17,020,000
Grain sorghums	"	1,707,000	1,744,000
Peaches	"	1,978,000	1,490,000
Apples	"	1,140,000	1,595,000

Manufacturing.—Total value of products manufactured in 1939 was $221,642,666, compared with $237,838,370 in 1937. Persons employed, 27,893 in 1939; 31,129 in 1937. Wages and salaries, $37,509,961 in 1939; $42,052,535 in 1937. Published figures on war production contracts alone totalled in 1941 in excess of $156,000,000; in 1942, $175,000,000.

Table II.—*Principal Industries of Colorado, 1939 and 1937*
(Exclusive of steel and rubber industries)

Industry	Value of Products	
	1939	1937
Meat packing	$33,005,533	$39,805,939
Bakery products	8,422,889	11,844,068
Butter	6,627,153	8,394,917
Newspaper and publishing	9,567,285	9,471,535
Flour, etc.	6,916,494	10,229,567

Mineral Production.—Production of all minerals in 1943 was valued in excess of $80,000,000. Molybdenum continued in first

Table III.—*Principal Mineral Products of Colorado, 1942 and 1941*

Mineral	Value 1942	Value 1941
Gold	$ 0,597,420	$13,301,015
Coal	21,972,500	18,416,460
Silver	2,185,344	5,192,318
Zinc	5,082,000	2,358,300
Copper	289,200	1,592,528
Petroleum	2,520,000	2,337,533
Lead	2,095,644	1,433,436
Molybdenum	27,750,000	25,883,000
Vanadium	1,500,000	1,300,000

place; vanadium and other nonprecious metals increased in relative importance. In 1943 Colorado produced in excess of 40,000,000 lb. of elemental molybdenum, approximately 70% of U.S. and 65% of world output, and over 3,000,000 lb. of elemental vanadium, approximately 93.4% of U.S. and 48% of world output. (E. NN.)

Columbia, District of: *see* WASHINGTON, D.C.

Columbia University. An institution of higher learning in New York city. The budget appropriation for 1942–43 was $14,443,881.93. During 1943 the major portion of the university's activities continued to be devoted to the war effort. Since the proclamation of the national emergency, Columbia had signed 101 war contracts with the government, half of which had been concluded, the funds involved far exceeding the annual university budget. Columbia in 1943 provided housing, meals and lecture space for some 2,100 V-7 men in the naval reserve midshipmen's school; 546 men were enrolled in the V-12 unit in the college, engineering and medical schools and there was an additional group of 156 at the medical centre. For statistics of enrolment, faculty members, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (M. H. T.)

Columbium. No information was available on the production of columbium in Nigeria, but it was reported that new alluvial deposits were discovered that materially increased the ore reserves. (G. A. Ro.)

Combined Chiefs of Staff, The. The establishment of the combined chiefs of staff by the governments of the United States and Great Britain was announced on Feb. 6, 1942. The four United States members were known as the "Joint United States Chiefs of Staff" and consisted of the chief of staff to the commander in chief of the army and navy; the chief of staff, U.S. army; the commander in chief, U.S. fleet, and chief of naval operations. and the commanding general, army air forces. The four British members were known as "Representatives of the British Chiefs of Staff." They consisted of the head of the British joint staff

mission in Washington and representatives of the first lord of the admiralty, the chief of the imperial general staff and the chief of the air staff.

Supporting committees were established to combine and co-ordinate all the factors of military intelligence, transportation, munitions, staff planning, meteorology and communications. A combined secretariat was set up to perform the necessary secretarial work for the combined chiefs of staff.

The combined chiefs of staff were charged under the direction of the president of the United States and the prime minister of Great Britain with collaborating in the formation and execution of policies and plans concerning the strategical conduct of the war, the broad program of war requirements and allotment of munitions resources and the requirements for overseas transportation for the fighting forces of the United Nations. Committee for Economic Development.

This committee was created in August 1942 as a private, non-governmental, nonprofit organization of U.S. businessmen. Its stated objectives were to stimulate, encourage and help individual companies in planning programs for products and markets that would enable them to reach and maintain high levels of productive employment in the postwar period and, through national research, to define conditions favourable for expansion of business enterprise when peace should come.

The CED's by-laws placed it under the general direction of a board of trustees, of which Paul G. Hoffman, president of the Studebaker (automobile) corporation, was named chairman, and William Benton, vice-president of the University of Chicago, vice-chairman.

Its Field Development committee, under the chairmanship of Marion B. Folsom, treasurer of the Eastman Kodak company, organized during the year 1943 more than 1100 community Committees for Economic Development in 47 of the 48 American states. These, following an approximately uniform procedure in their several communities, obtained and analyzed detailed information concerning current employment, employment in 1940 (America's most productive prewar year) and prospective employment in the postwar period. Guided by this knowledge, and by information concerning national business trends and various recommendations made available by the CED Research committee under the chairmanship of Ralph E. Flanders, president of the Jones & Lamson Machine company, they thereupon endeavoured to stimulate bold, sound planning, both by individual firms and by communities and districts, for expansion of postwar production and employment programs to levels in keeping with an anticipated increase in national productivity of 30% to 50% as compared with 1940.

The CED was founded in the belief that private enterprise could and should shoulder the chief responsibility for making the U.S. economy work at high levels of productivity; that the expected expansion in U.S. national income due to the technological stimulus of the war would find its chief market in abundant domestic employment; and that voluntary co-ordinated planning by business could, in large measure, achieve the desired result. (P. G. H.)

Commonwealth Fund, The.

This endowment, established in 1918 by Mrs. Stephen V. Harkness "to do something for the welfare of mankind" and later increased by gifts from the founder and from Edward S. Harkness, president of the fund from its inception until his death on Jan. 29, 1940, now amounts to approximately $48,000,000. In the year ending Sept. 30, 1943, the fund appropriated $1,503,124.35. Of this total considerably more than half was devoted to activities tending to promote or maintain physical and mental health. Public health activities, designed to raise standards of rural service, centred in Tennessee, Mississippi and Oklahoma. Fourteen rural community hospitals built or remodeled with aid from the fund were at work during the year. New construction was postponed till after the war. As means of strengthening teaching resources, fellowships were offered to instructors in medical schools and provision was made for visiting instructors, without restriction as to field; continued aid was given to departments of preventive medicine and psychiatry, to various forms of postgraduate medical education and to teaching arrangements designed to promote interplay between pediatrics and psychiatry. More than $324,000 was appropriated for medical research. The Commonwealth Fund fellowships for British graduate students at American universities were suspended during the war, but 18 fellowships for postgraduate study in medicine and public health were made available to Latin-Americans. The fund continued to aid child guidance enterprises in England, contributed to an advisory service for community mental hygiene clinics in the United States and published during the year seven books of educational significance in its fields of operation. Since the beginning of the war, the fund set aside nearly $1,250,000 for war relief and related purposes. The directors of the fund in 1943 were: Malcolm P. Aldrich (president), William E. Birdsall, Phil W. Bunnell, Adrian M. Massie, Lewis Perry, William E. Stevenson and Thomas D. Thacher. (B. C. S.)

Communications Commission, Federal: *see* FEDERAL COMMUNICATIONS COMMISSION.

Communism,

or revolutionary Marxism, is a system of government evolved under the leadership of Lenin and Stalin in the soviet union, the former Russian empire. Originally, as envisaged by Lenin and his closest collaborators, communism was a world-wide revolutionary movement aiming at the creation of a world society in which everybody would contribute to the common weal according to his capacity and receive a reward according to his need. Russia was regarded only as the starting point, the transformation of Russia into a modern progressive and highly industrialized state was regarded not as an end in itself, but as a temporary measure. But the hope of communist or socialist revolutions outside Russia soon faded away: nowhere did communism become a real force; in many countries its most determined opponent, fascism, came to power and suppressed all communist agitation and organization. Thus for the last ten years communism in Russia has taken a different development from that foreseen by Lenin. It was replaced more and more by a national patriotic trend for which the transformation and strengthening of Russia was an end in itself.

Stalin had led this development. In the famous "purges" of 1937 he liquidated most of the old collaborators of Lenin, the

devoted communists of the original revolutionary tendency. Stalin's own speeches, but even more the completely controlled literature, press and theatre of the soviet union stressed the glories of the Russian past and tried to instil a deeply nationalistic spirit in the soviet population and especially in the soviet youth. This trend which dominated all communist thought and propaganda in the last years became even more pronounced in 1943. A strong attachment to the Russian tradition expressed itself in the new relation to the Orthodox Church and in the reorganization of the Russian army as much as in the dissolution of the communist international, the Comintern, founded by Lenin in 1919 as an instrument of communist world revolution.

On May 22, 1943, the communist international was officially dissolved as having outlived its usefulness. It was recognized that "deep differences of the historic paths of development of various countries, differences in their character and contradictions in their social order, differences in the level and the tempo of their economic and political development," made every centralized international revolutionary action and direction impossible. World War II fundamentally affected the situation. The resolution proclaimed that in the countries fighting Germany it was "the sacred duty of the widest masses of the people and, in the first place, of the workers to aid by every means the military efforts of the governments of their countries." This dissolution of the communist international did not change the attitude of the communist parties outside Russia. From the moment that Germany had attacked the soviet union in June 1941, the communists in German occupied countries had become the most active supporters of the underground movement sabotaging and fighting the German occupation and influence in their countries, while the communist parties in Great Britain and the United States supported wholeheartedly the war effort of the governments of their countries, entirely subordinating the class struggle and all socialist demands to the most energetic prosecution of the war and the fullest aid to the soviet union.

The dissolution of the Comintern was followed in Sept. 1943 by the recognition of the Russian Orthodox Church. Metropolitan Sergius of Moscow came to Moscow from his semi-exile in a special train and was received by Stalin together with other high church dignitaries on Sept. 4. The next day all Russian newspapers gave front page prominence to the announcement that the government would place no obstacle in the way of a permanent organization of the church under a patriarch of all Russia and a re-established Holy Synod. Consequently Sergius was elected patriarch of all Russia and was installed on Sept. 12 in a brilliant ceremony in Moscow cathedral. All metropolitans and bishops of the Orthodox Church participated in the ceremony. The patriarch assured the government of the full support of the Russian Church for the war effort. This reconciliation of the Stalinist state with the Orthodox Church was only one of the many indications that the new Russia fully accepted and revalued all the Russian national and imperial traditions of the past which in the first years of the revolution had been violently denied and rejected.

This revival of Russian traditionalism and the new emphasis on Russian nationalism determined also the transformation of the communist army, diplomatic service and educational system. The change from the revolutionary attitude of Leninism to the emphasis on tradition was complete in all these fields. Stalin, who a few years ago had been simply comrade Stalin, assumed now the title of Marshal Stalin and dressed in a new ornate marshal's uniform. The Russian army tried to build up a strong traditional sense in the army officer corps. Generals of the czarist past, and great czars themselves, especially Peter the Great, were held up as examples. There was no stress put on revolutionary or working class heroes. As an American newspaper correspondent remarked, "perhaps as in no other land today, young Russian officers look back for guidance to the past. For Russians brought up after 1917, the rediscovery of national history is a new and exciting experience." The officers received back their massive gold shoulder epaulets of czarist time, distinguishing them more clearly from the rank and file than was done in the democratic armies, and generals were wearing again the striking red stripes on the sides of their trousers. Military discipline was strictly enforced, and the standard of saluting in the red army was unusually high. The former system of orderlies for officers was reintroduced, to take care of the officers' personal affairs, food, clothing and boots.

These changes in the army were paralleled by changes in the diplomatic service. Communist diplomats formerly appeared in simple dress. In 1943 they received ornate gold brocaded uniforms which they were wearing at the 26th anniversary celebration of the communist revolution. The new splendid formal attire again stressed the resemblance with czarist days. In the field of education coeducation was abolished in secondary and elementary schools, to take into account the different nature of the two sexes; the boys were to be trained for a stern soldier's life while the girls were regarded essentially as the future mothers. Military experts were to conduct drills for the premilitary age in the schools, and the teaching of Russian history and strict discipline of conduct were to be emphasized. This new stress put on the difference of the sexes, on motherhood, family and authority, was again a complete departure from the original communist attitude.

With the gradual abandonment of communist internationalism and the new stress on Russian nationalism, the ideas dominating the Russian empire of the czars began again to be stressed. Communist internationalism was replaced by Pan-Slavism. An all Slav committee was formed in Moscow and held its third meeting on May 9, 1943, with the participation of delegates of all Slav peoples. From Moscow all Slav peoples were summoned for the fight of Slavdom against the Germans. While the former organ of the communist international, the magazine, *Communist International*, which was founded in 1919, ceased its publication in July 1943, a new monthly called *Slavyane* or *Slavs* began its publication in Jan. 1943. The former slogan, "workers of all countries, unite," was replaced by the new slogan, "death to the German invaders." The old imperial Russian interest in the formerly Russian dominated territories on the Baltic sea and on the Black sea was revived, and Russian diplomacy seemed ready to resume an active forward policy in Iran and in the middle eastern countries as well as in the far east, thus resuming everywhere the traditional trends of Russian imperialism with a new vigour and strength.

Communist Party: *see* COMMUNISM.

Community Chest is the name given to a local co-operative organization of citizens and social welfare agencies; also known as "community fund," "welfare fund" or "united fund." In most communities during 1942–43 the familiar peacetime community chest organization was enlarged and combined with the various appeals for war relief, changing its local name to "community war chest," "united war fund" or variants.

The new war chests differed in structure from place to place. However, in general, they combined the normal fund-raising activities of the community chest, in behalf of the community's voluntary health and welfare services, with responsibility for

raising the community's contribution to foreign and domestic war relief causes. In general, the quotas of war relief funds adopted by the local war chests were arrived at through the budgeting of war relief appeals by a new wartime campaign organization, the National War fund, itself an extension of the fund-raising principle of the community chest. In many instances, the personnel of the community chest, with necessary supplementation, was responsible for administering the local war chest.

Fifteen and a half million contributions, making a total of $162,334,486, in 649 cities, were given to community chests and war chests to be used for voluntary social work and war relief activities during 1943. The average per capita raised for 1943 by 144 war chests which were included in an intensive study was $3.11, while 52 community chests which did not include war funds raised $1.40 per capita. Approximately one out of every four persons, in the 196 cities where the above community and war chests are located, made contributions for 1943.

On Oct. 1, 1943, 683 community chests were known to exist, 652 of them in continental United States, 27 in Canada, 2 in Hawaii, 2 in south Africa.

Community Chests and Councils, Inc., the national organization of community chests and councils of social agencies, was organized in 1918 as a clearing house of information for the 21 chests then organized. On Oct. 1, 1943, the number of member chests and councils, affiliated on a voluntary basis, was 459.

Officers for 1943-44 were: Gerard Swope, honorary president; Harry C. Knight, chairman of the board; E. A. Roberts, president; vice-presidents, Col. Robert Cutler, Harry P. Wareham; J. Herbert Case, treasurer; Lynn D. Mowat, secretary. Ralph H. Blanchard was executive director. The address of the association is 155 E. 44th st., New York 17, N.Y. (*See* also RELIEF.)

(A. T. B.)

Community Trusts. The philanthropic resources of 76 community trusts and foundations in continental United States, Hawaii and Canada increased from $13,500,000 in 1925 and $45,000,000 in 1935 to $56,036,000 at the beginning of 1943. At the latter date the Chicago Community trust held charitable funds aggregating $10,600,000, and the resources of the New York Community trust totalled $10,036,487. Sizable community foundations were in operation also in Cleveland, Boston, Winnipeg and Indianapolis.

The New York Community trust led in volume of outpayments, disbursing $547,262, followed by Chicago Community trust, $242,941; Permanent Charity fund, Boston, $235,300, and Cleveland foundation, $222,450. Aggregate disbursements, exceeding $1,000,000 for the 12th consecutive year, totalled $1,725,095, compared with the $1,605,801 paid out by these agencies in 1941.

Congregational Christian Churches.

The Congregational Christian denomination is the result of the merger (1931) of the Congregational Churches established in America in 1620 and of the Christian Churches formed in 1780 and the following years. In 1943 the combined churches had 5,921 churches and a total membership of 1,077,346. During the statistical year 1942, the denomination received 63,445 new members and made a net growth in membership of 10,657.

The denomination is governed by two cardinal principles: freedom of the local congregation in everything that concerns its life and work and fellowship of all the congregations in common enterprises. This freedom is not licence; it is a regulated freedom. The regulation comes from within, not from without. There is no power that can compel a congregation to do anything it does not wish to do. The slight measure of denominational control of a local church lies in the association to which the church belongs. This association is made up of official delegates of the churches that belong to it. It meets twice a year. The representatives of the churches make such reports of their life and work as they deem will be of interest, but there is no set form of report nor are there formal questions to be answered.

The denomination finds expression of its national life in the general council which meets biennially. The delegates to the council number 1,006 and are elected by the local associations and conferences. The council maintains a national office at 287 Fourth Avenue, New York, with a staff. It issues the *National Yearbook* and other publications for use of the churches and represents the churches in interdenominational relationships. Affiliated with the council are the Home and Foreign Mission boards and other denominational agencies.

The Congregational Churches are organized on the democratic basis. Every member has full right to discuss, to determine and to vote on all matters that concern the life and work of the churches.

The outstanding contribution of the Congregationalists to American life is the influence they exert in behalf of common democracy. The fathers held fast to the thought that God in His rule of the universe was guided always by absolute standards of righteousness. So the rulers of the local community representing Him tried to do their work in the same way. They drew their election from the people, but when an officer was elected he had more than the dignity conferred upon him by the free votes of the people, for he was also the representative of the higher power. This religious foundation of their civil government grew out of the close connection of the church with all phases of life. In such an atmosphere and with such ideas it was to be expected that the Bible should be the Great Book of Law.

The basis of membership in a Congregational Church is a statement of purpose rather than a statement of creed. Congregationalists hold that creeds, which are intellectual statements of religious experiences, represent landmarks along the pathway of religious thought. As experiences and intellectual capacities change, however, it is inevitable that creeds should change. Consequently, if the membership of a church is based upon the subscription of some particular historical creed, full opportunity for intellectual thought and intellectual freedom may not be supplied. No member is ever told that he must believe any specific religious tenet in order to be a good church member. So long as he shares in the common purpose and feels that through fellowship with other seekers after a genuine religious experience, he can best realize the development of his own life, he is worthy to be a member of the organization. This basis of membership naturally attracts to the Congregational fellowship those who are liberal and openminded in their attitude toward social, moral and religious questions. This basis of membership means that without controversy and difficulty, people of different shades of intellectual thought about religion work happily together in the Congregational fellowship.

(F. L. F.)

Congress, United States. The 78th U.S. congress met for its second session Jan. 10 1944. It comprised the following members (as of Jan. 17, 1944):

United States Senate

Congress of Industrial Organizations.

During 1943, C.I.O.'s membership totalled 5,600,000. Through the activities of various C.I.O. affiliates and about 3,500 labour management committees new plans were adopted which increased war production. This won for hundreds of C.I.O. plants and thousands of C.I.O. members official recognition for their contributions to increased output. The C.I.O. raised more than $22,000,000 for war relief; more than 2,000 C.I.O. members were active on governing boards of community social agencies.

The wave of anti-labour legislation, climaxed by the Smith-Connally bill, also prohibiting political contributions by unions, resulted in an increase in C.I.O. political action. In addition to political pressure for price control, anti-poll tax legislation, the Wagner-Murray-Dingell bill, centralization and co-ordination of war planning, and a progressive tax program, the C.I.O. established a Committee on Political Action. Its purpose was to achieve united action in the political field with all organized labour.

The C.I.O. planned to attend the World Labor congress in London during June 1944.

In 1943, Philip Murray was re-elected C.I.O. president, and James B. Carey secretary-treasurer. (*See* AMERICAN FEDER-

ATION OF LABOR; LABOUR UNIONS; STRIKES AND LOCK-OUTS; UNITED STATES.) (P. MY.)

Coningham, Sir Arthur (1895–), British air force officer, was born in Brisbane, Australia, and educated in New Zealand. He joined the New Zealand infantry in 1914 and served for two years in Samoa and Egypt. Transferring to the royal flying corps in 1916, he became one of the outstanding British airmen of World War I, receiving the military cross, the D.S.O. and the D.F.C. His flight from Cairo to Kano in Oct. 1925, won him the air force cross. In 1941 Coningham was knighted as companion of the bath. As Northwest African tactical air force commander, Coningham worked in close co-operation with Gen. Bernard Montgomery in chasing the Afrika Korps out of Libya, 1942–43. Air Marshal Coningham continued to participate in the campaign which drove the axis from Tunisia, serving under Gen. Dwight Eisenhower in the Sicilian campaign during July and August of 1943.

Connecticut. The next to the smallest of the New England states, Connecticut is one of the thirteen original states, commonly known as the "Nutmeg state," the "Constitution state," or the "Land of Steady Habits"; area, 5,004 sq.mi. (incl. 125 sq.mi. water); population (1940), 1,709,242, or 348.91 persons to the sq.mi.; capital and largest city, Hartford (166,267). Other large cities with 1940 population figures: New Haven (160,605); Bridgeport (147,121); Waterbury (99,314); New Britain (68,685); Stamford (60,996). Hartford and Bridgeport, on account of the great influx of war workers, each claimed populations of 200,000 by 1943.

History.—The state officers during 1943 were all Republicans: governor, Raymond E. Baldwin; lieutenant governor, William E. Hadden; secretary of state, Frances B. Redick; treasurer, Carl Sharpe; comptroller, Fred R. Zeller; attorney general, Francis A. Pallotti. The United States senators were John A. Danaher (Republican), term expiring 1945; Francis T. Maloney (Democrat), term expiring 1947.

During the regular session of the general assembly (Jan. 6 to May 19), there was a Republican majority of 14 in the senate and one of 132 in the house, which enabled the administration to carry out most of its legislative program. Important measures enacted: the governor was empowered to suspend or modify any law which in his opinion conflicted with the war effort; the public works department was abolished and most of its duties transferred to the comptroller; a postwar planning commission was established; the commission on forests and wildlife allotted $400,000 to purchase additional land; maximum payments for workmen's compensation were increased from $25 to $30 per week; the state defense council was replaced by a war council with greater powers.

Local elections in 143 towns in October resulted in a Republican gain of four. In the November local elections, Republicans regained control in Hartford for the first time in ten years, and although Democrats retained control in New Haven and Waterbury, it was with sharply reduced pluralities. Bridgeport remained in the Socialist column. In these elections no federal questions were involved.

Education.—In 1941–42 the 841 elementary schools of the state had 171,612 pupils and 5,205 teachers; the 45 junior high schools had 23,540 pupils and 748 teachers; and the 94 high schools had 74,178 pupils and 3,163 teachers—a total of 980 schools, 269,330 pupils and 9,116 teachers. These were all decreases from the year 1940–41. Total expenditures of the state for education, however, were $30,415,656, an increase of $1,207,900.

Public Welfare, Charities, Correction.—During June 1943, there were 44,473 persons in the state receiving some kind of public assistance. This was a reduction of 28½% from June 1942. The amount paid to these people in June 1943 was $1,212,720, a reduction of 26.8% from the year before. Public assistance in the categories of agricultural commodities, Civilian Conservation corps and Work Projects administration disappeared entirely; even the number of those receiving old age assistance, 15,632, was a decrease of 11% over 1942. The only category showing an increase was aid to dependent children which, with 6,835 cases, was 11% higher.

As of June 30, 1943, there were 3 state hospitals for the mentally ill, with 7,527 patients, 2 institutions for the feeble-minded, with 2,124 inmates, 2 institutions for 86 blind persons, and 1 institution for 140 deaf persons. The state maintained 15 correctional institutions.

Communication.—For the first 10 months of 1943, there were registered 518,468 motor vehicles, being a reduction of only 7.4% compared with 1942; operators' licenses declined 4.7% to 596,556. As of June 30, 1943, the state aid and trunk line highway system totalled 2,918 mi., of which 786 were concrete and 2,132 other kinds of improved roads. New highway construction was practically nil. In February the new New London-Groton bridge on U.S. highway No. 1 was opened for traffic. The state was served by 3 railroad companies with mileage of 875; 47 bus companies, and 114 taxicab companies. As of June 30, 1943, there were 468,177 telephone outlets.

Banking and Finance.—On Sept. 30, 1943, deposits in 72 savings banks were $859,483,124, an increase of $71,000,000 over 1942; the assets of 64 state banks and trust companies were $636,336,321, an increase of $133,000,000; the assets of 51 (a decrease of 1) national banks, on June 30, 1943, were $641,948,000, an increase of $161,000,000. There were 34 building and loan associations.

Total cash receipts of the state for the year ending June 30, 1943, were $103,097,008; disbursements were only $73,636,299. The budget adopted by the general assembly for the biennium 1943–45 was $118,430,421. The total of all state bonds outstanding July 1, 1943, was $26,507,000, against which a retirement fund of $15,741,189 had been set up, making a net state debt of $10,765,811.

Agriculture.—While Connecticut is not primarily an agricultural state, the cash farm income for 1942 was reported by the department of agriculture as $75,075,000, an increase of almost $10,000,000 over 1941. Livestock and livestock products, as usual, accounted for over half the total, the balance being made up by crops, which, in order of importance, were tobacco, truck crops, potatoes and apples.

Table I.—*Leading Agricultural Products of Connecticut, 1943 and 1942*

Crop	1943 (est.)	1942
Tobacco, lb.	18,640,000	18,577,000
Potatoes, bu.	3,536,000	2,942,000
Corn, bu.	2,050,000	2,058,000
Apples, bu.	858,000	1,992,000

Manufacturing.—The index of business activity in the state rose in April 1943 to 227.2 (monthly average in 1939=100), the highest point ever attained. In June it had declined to 219.7. Several areas in the state were declared "labour shortage areas" by the War Manpower commission, with the result that contracts which would have been awarded to Connecticut were allocated elsewhere. In 1943 there were 3,688 manufacturing plants in the state employing 544,611 persons, of which 349,435 were men and 195,176 women. Production figures were undisclosed, but Connecticut received nearly 4% of all federal war contracts awarded between June 1940 and June 1943.

Mineral Production.—The state's production of minerals is very small; for many years the cost of mining iron and copper has been prohibitive. Search for strategic materials disclosed mica deposits, which were being worked, and in 1943 a deposit of the rare element beryllium was discovered. (J. BR.)

Conservative Party, Great Britain.

Reacting to movements in other parties and to increasing interest in postwar possibilities, the Conservative and Unionist party, while still strictly adhering to the political truce at by-elections, displayed a livelier activity in 1943 than in any year since the war began. For the first time its national association met in annual assembly in addition to the meetings of the central council. The prime minister was abroad when the delegate conference took place in May but Anthony Eden, the foreign secretary, addressed it. The marquess of Salisbury was re-elected president of the national association while R. Catterall of Bolton became chairman of the council in succession to Mrs. Lionel Whitehead. One of the three vice-chairmen appointed was R. A. Butler, president of the Board of Education, whose far-reaching education bill, presented at the end of the parliamentary session, was to be a major measure in the commons' program for 1943. The other vice-chairmen chosen were Major R. G. Proby and Mrs. Hornyold-Strickland.

Resolution discussed at the conference included one from the Federation of University Conservative associations, calling for the issue of a clear party policy. This was sympathetically received, but the conference recalled a speech in which the prime minister had not long before said such a pronouncement would be impracticable in existing circumstances. There was unanimous support for a resolution urging a scheme to facilitate working-class Conservative candidatures. A revival of the Conservative junior movement was called for in another resolution and satisfaction expressed at the news that a committee with Gerald Palmer, M.P., as chairman was taking steps in this matter. Later in the year a central committee of the association on postwar reconstruction, under the chairmanship of Sir Edward Cadogan, M.P., issued, as the first of a promised series of reports, one presenting a scheme to meet demobilization problems.

Stimulus to the new party activity was given when in October the prime minister, intervening in a coal crisis debate in parliament, expressed the personal view that return to party politics was more probable than a continuance of the coalition after the war. The introduction of the bill to reform the electoral machinery also strengthened the desire to be prepared for an election. Widespread Conservative anxiety about the continuance of wartime controls and restraints showed itself in the activities of the parliamentary committee of backbench Conservative M.P.'s, but a younger group of 41 M.P.'s under Viscount Hinchingbroke, more warmly supporting the social security ideas in the Beveridge report, produced its own social, economic and agricultural program in a pamphlet, *Forward by the Right.* (L. DU.)

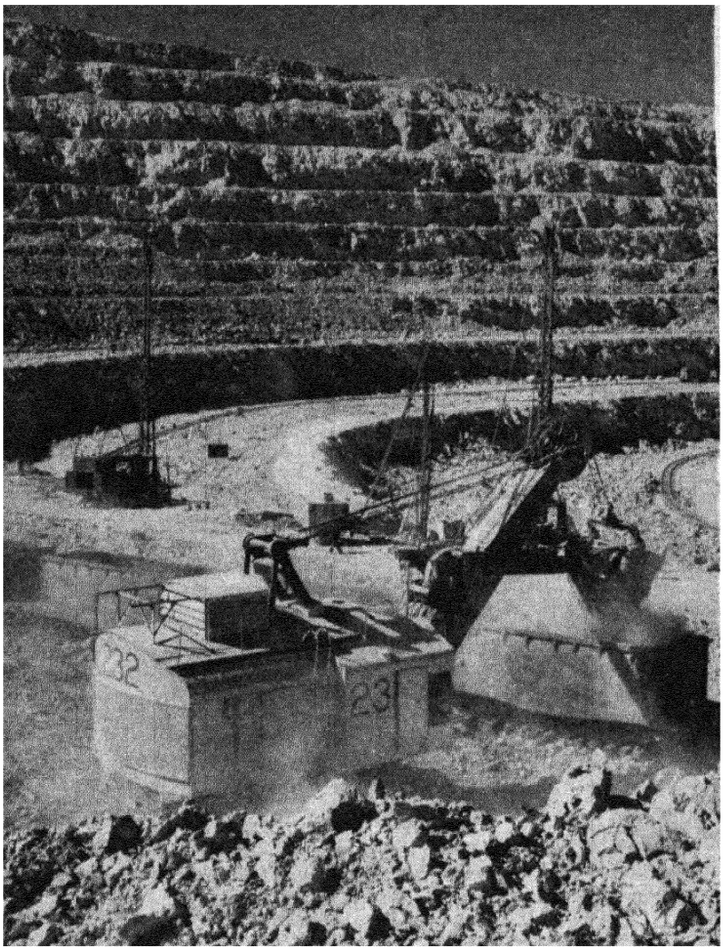
Consumer Credit.

The liquidation of consumer credit, which had been in progress since Sept. 1941, continued through 1943, but the rate of liquidation declined.

The downward trend began with the promulgation by the Federal Reserve board of Regulation W, which prescribed minimum down-payments and maximum payment-periods for instalment sales and loan contracts. The liquidation was gradual at first, but it was accelerated in 1942, first by the stoppage of production of consumers' durable goods that had been sold largely on credit terms and then by the tightening of the instalment credit requirements of the regulation and the broadening of its scope to cover instalment sales of additional goods, charge-accounts and single-payment loans.

Throughout the past year sales of consumers' durable goods have remained relatively constant and there has been no significant tightening of credit terms under Regulation W. Hence the slowing down of the rate of liquidation. But even if credit terms were further restricted, the resulting decline in outstandings would be small. By the close of 1943, the outstanding amount of consumer credit had been reduced to about 45% of its prewar level of $10,000,000,000. As the solid core is approached, further liquidation will be more and more difficult. It seems probable, therefore, that the liquidation of consumer credit which has contributed during the last two years a significant anti-inflationary force will come to an end early in 1944.

The pattern of liquidation is indicated by the following figures:



Period	Average Monthly Liquidation (Adjusted for seasonal)	
	Million dollars	Per cent of outstandings
Last quarter of 1941	120	1.2
First half of 1942	320	3.8
Second half of 1942	245	3.5
First half of 1943	180	3.1
Second half of 1943	100*	2.3

*Preliminary.

In view of the prospective disappearance of consumer credit as a deflationary force, the Office of Price Administration developed and presented for discussion a plan of instalment selling for postwar delivery which sought (1) to divert purchasing power from the current market, (2) to create a backlog of prepaid orders for postwar goods and (3) to produce an orderly postwar market for goods that have disappeared for the duration by determining the order of priority to these goods when they again become available. The plan was opposed by the treasury department on the ground that postwar delivery sales would interfere with sales of war bonds and by the National Automobile Dealers' association on the ground that it would extend government control into the postwar period. Nevertheless, a number of enterprises put into effect somewhat similar plans for the sale of household electrical appliances, motion picture theatre equipment, printing presses and similar goods.

The year witnessed the beginnings of what is likely to become an increasingly heated debate on the desirability of continuing federal control of consumer credit into the postwar period. One group of instalment sellers, who use liberal credit terms as a competitive sales device, organized to attack Regulation W as an inequitable restraint on freedom of contract. On the other hand, a number of other merchants, notably department store officials, called attention to the beneficial effects of federal regulation both for buyers and sellers, pointed to the necessity of restraining demand for consumers' durable goods immediately following the war and urged the continuation of the Federal Reserve board's controls.

In the field of state legislation to correct social evils in consumer credit granting, some progress was made during the year. Three additional states—Idaho, Nevada and Colorado—enacted

REMOVING ORE from an open-pit copper mine in Chile

figures that the performance during the year checks quite closely with that anticipated, as shown in the preceding estimate.

According to reports issued by the War Production board the output of brass-mill products increased from 1,201,491 tons in the first half of 1942 to 1,410,444 tons in the first half of 1943. Another announcement stated that since the Copper Recovery corporation had substantially completed the work for which it had been established, namely the recovery of idle and excess inventory stocks for use in the war program, it would be disbanded at the end of the year.

Late in 1943 it was reported that the supply position in the United States had been considerably improved, and that demand was approximately balanced by supply.

No reports whatever were received on production in 1943 in countries outside of the United States, and reports covering 1942 were scanty. A press report gave the 1942 output of Canada as 270,000 short tons, which is lower than had been expected. Belgian Congo was credited with 168,000 metric tons, a moderate increase over 1941. Exports from Peru were 35,139 tons in 1942, against 35,325 tons in 1941. Publication of output was discontinued in Chile, but the rate in the first quarter of 1942 was somewhat ahead of that for 1941.

A combined copper committee for the United States, United Kingdom and Canada was established in Feb. 1943. The object of this committee, as stated in the official announcement of the appointments, was to take over "the primary responsibility for assembling and reviewing data relating to supply requirements, inventory and consumption of copper in order that the copper supply available to the three countries may be utilized to the best advantage in war production." The formation of the committee followed an investigation which showed that there was need for more comprehensive and better-integrated information on the respective programs involving the use of copper, and the requirements and supplies available to meet them.

It is interesting to note that the figures presented above for the copper supply of the United States in 1942, a total of 2,866,980 short tons, including secondary copper, was about 2% larger than the estimated figure for world production of new copper in 1941. If we may assume that the same condition would hold true for the succeeding years, we have a basis for an estimate of world production in 1942 at about 3,000,000 short tons, or 2,720,000 metric tons; this may prove not to be well founded, but it is the first data to become available as a basis for such an estimate. (*See* also BUSINESS REVIEW; MINERAL AND METAL PRODUCTION AND PRICES; STRATEGIC MINERAL SUPPLIES.) (G. A. Ro.)

Copra: *see* COCO-NUTS.

Copyright. During the year 1943 no new copyright legislation was enacted although several amendatory bills were introduced in congress. The main proposals were a revival of efforts to amend the Copyright Act of 1909 to encompass transcriptions and recordings of every character, involving commercial public performance. Because of the exigency of other matters, however, no action was taken by congress in relation to these bills.

From the beginning of 1943 there was a steady falling off in the number of copyright registrations, amounting to 11.7%, particularly in relation to foreign works published abroad, with a resulting decline in gross receipts. This general decrease was noticeable in registrations for all classes of works but was least felt in the class of musical compositions.

The copyright law in force requires, as one of the conditions precedent to the registration of a claim to copyright in any work, the deposit of two copies of American books and one copy of foreign books, for the enrichment of the Library of Congress. During the fiscal year 1943, 252,123 books and other articles were deposited for copyright registration, including 17,316 printed volumes, 55,116 pamphlets and leaflets, 85,990 periodicals, 4,190 dramas, 57,343 pieces of music, 1,462 maps, 1,655 photographs, 15,329 prints, labels and pictorial illustrations, 3,484 motion pictures and 5,368 works of art and drawings. These were all produced in the United States. From abroad there were received 156 books in foreign languages and 517 books in English. Of this great collection of copyrighted works, 161,281 were transferred to the permanent collections of the Library of Congress; 1,653 were sent to other governmental libraries and 3,392 were returned to the claimants of copyright. (C. L. B.)

Corn (MAIZE). A second record crop of corn was harvested in 1943 as estimated by the United States department of agriculture at 3,077,159,000 bu. This is about 55,000,000 bu. below the all-time record crop of 1942 of 3,131,518,000 bu., but it is 727,000,000 above the 10-year average 1932–41 of 2,349,276,000 bu. The acreage in 1943 was about 6% above 1942, 94,267,000 acres compared to 89,484,000 but less than the 10-year average of 94,511,000 acres. The average yield in 1943 was 32.7 bu. compared to 35.5 bu. in 1942 and a 24.9 bu. average in 1932–41. The favourable returns were due to good weather in the fall which permitted the late planted grain to reach maturity. More than half of the corn acreage grown in 1943 was grown from hybrid seed. In most of the corn belt states more than 90% was grown from hybrid seed, and it was gaining rapidly in surrounding areas. The acreage harvested for grain was the largest after 1933, yet the percentage of the crop harvested was smaller than either 1941 or 1942. The use of mechanical pickers was widespread.

U.S. Corn Production by States, 1943 and 1942

State	1943 bu.	1942 bu.	State	1943 bu.	1942 bu.
Iowa	640,740,000	574,080,000	Louisiana	23,018,000	24,412,000
Illinois	426,600,000	416,934,000	South Carolina	24,720,000	21,330,000
Nebraska	216,632,000	242,708,000	Colorado	14,430,000	18,228,000
Indiana	210,406,000	216,702,000	Maryland	11,804,000	16,344,000
Minnesota	215,468,000	207,190,000	West Virginia	14,042,000	13,770,000
Ohio	174,042,000	185,752,000	New Jersey	6,086,000	8,370,000
Missouri	139,810,000	146,899,000	Florida	8,151,000	7,413,000
Wisconsin	108,924,000	103,544,000	Delaware	3,225,000	4,092,000
South Dakota	79,718,000	101,673,000	Montana	3,230,000	3,800,000
Kansas	84,318,000	90,063,000	New Mexico	2,930,000	3,792,000
Kentucky	75,350,000	82,200,000	Vermont	2,432,000	2,800,000
Texas	88,416,000	78,561,000	California	2,516,000	2,574,000
Tennessee	65,964,000	75,924,000	Idaho	1,683,000	2,444,000
Michigan	52,904,000	69,703,000	Connecticut	1,920,000	2,058,000
Pennsylvania	40,172,000	54,567,000	Wyoming	1,243,000	2,013,000
Mississippi	43,508,000	49,198,000	Massachusetts	1,722,000	1,804,000
North Carolina	51,018,000	47,068,000	Oregon	1,862,000	1,742,000
Alabama	48,510,000	43,960,000	Washington	1,457,000	1,353,000
Georgia	45,288,000	39,160,000	Utah	882,000	792,000
Arkansas	25,262,000	37,116,000	Maine	640,000	672,000
Oklahoma	23,350,000	35,631,000	New Hampshire	615,000	630,000
Virginia	33,275,000	35,580,000	Arizona	402,000	396,000
North Dakota	25,335,000	28,425,000	Rhode Island	304,000	328,000
New York	22,715,000	27,600,000	Nevada	120,000	120,000

The great need for feed for the large number of livestock on farms led the War Food administration to suggest for 1944 a 100,000,000 acreage for corn. The largest increases were suggested for the northwestern region where feed must be shipped in and where it was very short in 1943 and caused much livestock to be moved to market early. Increased acreage was also asked for in the north central region where corn usually yields more feed units per acre than any other feed grain. Corn usually furnishes two and a half times as much grain for livestock as do oats, barley and grain sorghums combined. It was expected that the additional fertilizer required would be available.

Corn prices advanced during 1943 but because of the greater returns received from corn by feeding it to hogs than selling it at ceiling prices, relatively little corn was moved from farms, causing shortages in processing and feed-mixing plants and in areas where corn is usually purchased. Special efforts were made to move corn to the deficit areas by the War Food administration by purchasing corn in July and August and assuring sellers that they would receive any rise in price before October 31. These purchases were sold to processing plants and livestock feeders. The average price of corn was about $1.09 per bu. in the fall of 1943 compared to a 5-year average of 83 cents per bu. in 1935–39. At the same time hogs were about 14 cents per lb. compared to 8.38 cents per lb. in the 5-year prewar period.

(J. C. Ms.)

Cornell University. An institution of higher learning, nonsectarian and co-educational, at Ithaca, N. Y., founded in 1865 and incorporated as a land-grant college under the Morrill act of 1862. The university comprises the endowed schools and colleges of arts and sciences, engineering, architecture, law, medicine and nursing and the state-supported colleges of agriculture, home economics and veterinary medicine. The divisions of medicine and nursing are in New York city and are operated in conjunction with the New York Hospital. Two experiment stations, at Geneva and Farmingdale, N. Y., are operated in connection with the college of agriculture. Degrees for advanced study other than professional are awarded through a graduate school.

The foremost development in organization during 1943 was the affiliation of the New York Hospital school of nursing as an integral part of the university, offering the degree of bachelor of science in nursing. Special wartime developments were the assignment of large contingents of army personnel to the campus and great expansion of the naval training school, the government-sponsored war research program, and war training courses offered in co-operation with the U.S. office of education. For statistics of the faculty, student enrolment, library, endowment, etc., *see* UNIVERSITIES AND COLLEGES. President, Edmund Ezra Day, Ph.D., LL.D. (E. E. D.)

Cornhusking. With farmers busy with the harvest and many of the contenders in the armed forces, no national and but few state championships were held in cornhusking during 1943. It marked the second straight year in which the national meet was postponed. Floyd Wise of Prairie Center, Ill., in 1943 a member of the U.S. armed forces, continued to be regarded the country's champion cornhusker, having won the last national event in 1941. (M. P. W.)

Cosmic Rays: *see* PHYSICS.

Costa Rica. A Central American republic, north of Panamá and south of Nicaragua. Area: 23,000 sq.mi.; pop. (1940 est.) 656,129. The population is predominantly white (approximately 80%); an estimated 3% are Negroes, living in the Caribbean coastal area. The bulk of the population lives on the Meseta Central, or central plateau area. Capital: San José (68,465); other cities are Heredia (9,610); Alajuela (9,232); Limón (9,129); Puntarenas (7,722); Cartago (8,786). Language: Spanish. President in 1943: Dr. Rafael Angel Calderón Guardia.

History.—Costa Rican co-operation in the United Nations war effort was continued during 1943, the most significant single development being the arrangement in March of an agreement by which the United States was given a 25-year lease on 10,000 ac. of land for the production of cinchona. The United States also planned to purchase all suitable balsa wood that Costa Rica could produce, with a formal agreement pending signature in October.

Certain constitutional guarantees remained suspended, as in 1942. Much interest developed during the year in political alignments being made in prospect of the presidential election due in 1944. Leading candidates were a former president, León Cortez, and Teodoro Picado, the latter the present choice of the National Republican party (now in power) and also backed by the Vanguardia Popular, the former Communist party. Electoral reforms proposed in the spring raised objection on the ground that one candidate would be favoured, and by June the proposed laws were withdrawn. In the same month Archbishop Sanbria announced that Catholic workers could hold membership in the former Communist party, but not in fascist or nazi organizations.

A new labour code introduced in April was opposed by conservatives, but was passed by the legislature in November.

Serious advances in prices in the early months of the year resulted in a drastic decree designed to curb profiteering; for profit-taking of over 20% penalties ranged up to six months in prison. Shortages in many items were noted. In the latter half of the year conditions improved, and by September price levels had dropped slightly. Private automobiles were allowed three gallons of gas in May where none had been allowed in April.

Both Mexico and the United States raised the rank of their official representative from minister to ambassador.

Education.—In 1942 Costa Rica had 697 schools, with an estimated attendance of 73,320. Private schools numbered 61, with 3,889 students. The literacy rate (76%) is the best in Central America.

Finance.—The monetary unit is the gold colón, valued at 17.7 cents U.S. in 1943. It has been withdrawn from ordinary circulation. The 1943 budget was balanced at 44,454,839 colones, but a deficit was expected for the year. The public debt (Dec. 31, 1941) was 149,195,010 colones (105,175,023 external; 44,019,987

Internal). Notes in circulation (1941) totalled 66,900,000 colones.

Trade and Communication.—No 1943 figures on trade were available; in 1941 imports were valued at $17,754,186; exports, $10,053,257. The favourable trade balance with the United States for 9 months of 1943 was $143,000. Costa Rica has some 450 mi. of railway, and about 300 mi. of roads.

Agriculture.—The coffee crop for the year 1942–43 was estimated at 57,485,960 lb. Cocoa exports (1942) amounted to 12,176,178 lb., banana exports (1942) to 2,144,400 stems, sugar production (1942) to 23,000 short tons.

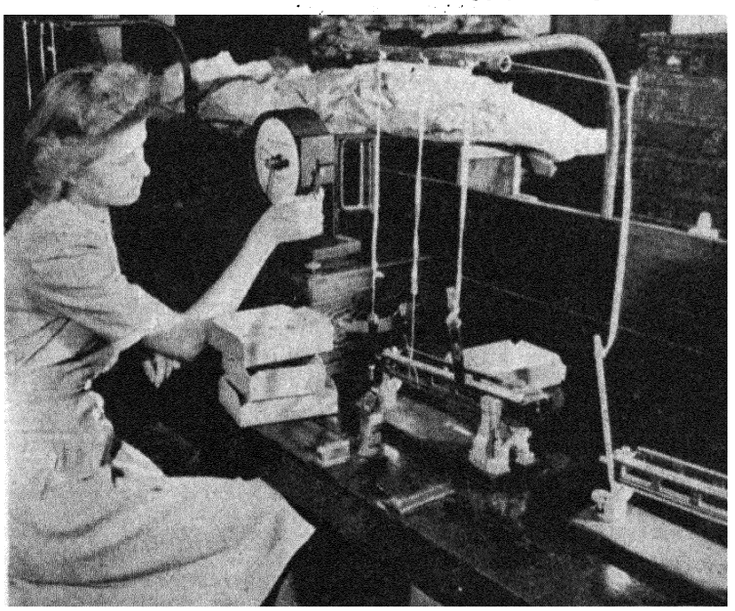
Cotton. **Cotton Manufacture.**—All the demands for cottons for military use were met promptly. The main problem facing the industry in the U.S. was that of meeting demands for essential civilian requirements, and also for lend-lease and rehabilitation.

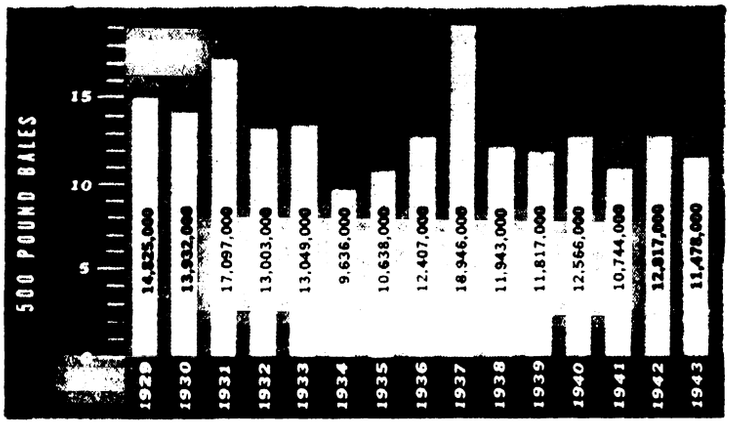
The year 1944 loomed large as possibly the strategic year in the determination of future trends in the cotton industry. Some time or other the sellers' market was expected to give way to a buyers' market. In 1943, the prospect of demand for lend-lease and rehabilitation, the possible void existing in some households, although this is exaggerated, and the reclothing of returned service men, were all on the bullish side. On the other hand, the fact that a very much higher production level was built up than existed before World War II, coupled with possible buyer resistance as the tax burden became more and more acute, indicated that the continued activity was not likely to be maintained indefinitely. The turn in demand could easily come during 1944, or shortly thereafter. For that reason, the industry became more and more impressed with the need for research: particularly research of a type which would enable manufacturers to make a profit no matter what the future course of demand might be, nor what happened to the various raw materials. On the latter point, there was a growing feeling that the so-called "battle of the fibres" had developed to a point where it was not a battle at all but rather a question of which fibres best served to produce a specific end-product. Those were the fibres which would eventually win out, and consequently that was why research—both technical research and product research—was so important in 1943. (*See* also LINEN AND FLAX; RAYON AND OTHER SYNTHETIC FIBRES; TEXTILE INDUSTRY; WOOL.) (D. G. WO.)

Cotton Production.—The 1943 cotton crop of the United States was estimated by the United States department of agriculture in December at 11,478,000 bales of 500 lb. gross weight. This compared with a crop of 12,817,000 bales produced in 1942 and a 10-year average of 12,474,000 for 1932–41. The acreage in 1943 was 21,874,000 acres compared to 22,602,000 acres in 1942 and 27,718,000 acres average for the 10 years 1932–41. The relatively high yield per acre in 1943 of 252 lb. was only 20 lb. below the record high yield of 1942 but was 35 lb. above the average and was exceeded in only two other years of record. The acreage, on the contrary, was the smallest of any year since 1900.



The production of American Egyptian cotton was estimated at 68,300 bales compared to 75,300 bales produced in 1942. The production of Sea Island cotton was estimated at only 300 bales compared to 800 bales in 1942. The production of cottonseed from the 1943 crop was forecast at 5,116,000 tons, compared to 5,717,000 tons in 1942 and 5,549,000 tons on the 10-year average. This production is computed by taking 65 lb. seed for each 35 lb. net of lint. Most of the cottonseed goes to oil-mills for crushing to secure the vegetable oil. From the 5,717,000 tons of seed produced in 1942, 4,514,728 tons were delivered to mills for crushing, according to the bureau of the census.

U.S. Production of Cotton by States, 1943 and 1942



State	1943 bales	1942 bales
Texas	2,860,000	3,038,000
Mississippi	1,840,000	1,968,000
Arkansas	1,110,000	1,485,000
Alabama	955,000	925,000
Georgia	850,000	855,000
North Carolina	595,000	727,000
Oklahoma	385,000	708,000
South Carolina	695,000	699,000
Tennessee	490,000	625,000
Louisiana	735,000	593,000
California	360,000	402,000
Missouri	295,000	417,000
New Mexico	111,000	111,000
Virginia	25,000	34,000
Florida	17,000	16,000
All others	16,000	21,000

World Cotton Production.—Total world production of cotton, United States and foreign, reached a high record of 36,745,000 bales in 1937 and then began to decline. The total for 1942 was 26,483,000 bales, which is about the average since the year 1924. Foreign production increased during the first full war year 1940 to 16,289,000 bales and then began to decline, being only 13,850,000 bales in 1942 and probably the crop for 1943 would show a small increase, if any. At the same time the world carryover of foreign cotton increased from 7,501,000 bales, or a 5.2 months' supply in 1939 to 12,445,000 bales in 1943 or about a 12 months' supply. This represented 52% of the world's carryover cotton in 1943 compared to only 35% in 1939.

Consumption of foreign-grown cotton was about 17,258,000 bales in 1938–39 but declined steadily thereafter to 12,700,000 bales in 1942–43, a reduction of 28% in four years. At the same time the consumption of American cotton declined only slightly from 12,876,000 bales in 1939 to 12,140,000 bales in 1942. Mill consumption increased in the United States during this period from 7,784,000 bales in 1939 to 11,100,000 in 1942. The labour situation in cotton mills threatened to bring about a decline in spinning late in 1943. With total world carryover of cotton at the high level of 23,900,000 bales and production being maintained the outlook was for an abundant supply when peace comes.

TESTING THE BREAKING STRENGTH of cotton fibres at a U.S. department of agriculture laboratory, Stoneville, Miss., in 1943

COTTON CROP in the United States. The figure for 1943 is the department of agriculture's estimate of Dec. 1

Foreign cotton being available at lower prices than American cotton was expected to direct consumption to the foreign stocks. Under the "Steagall amendment" the price of American cotton would continue to be supported for two years after World War II by means of a loan amounting to 90% of parity. While growers were receiving the highest prices in many years (20.20 cents in September, the highest since 1928), the total income to cotton growers was estimated to be about $1,301,000,000 for 1943. In 1942 this total was put at $1,426,000,000, the highest after 1929. A shift to the use of foreign-grown cotton was particularly evident in 1942, however. Canada began to use Brazilian cotton which sold delivered in Canada at several cents a pound under U.S. prices until the shipping situation became so tight as to cause a return to the use of U.S. cotton.

Cotton production in foreign countries in 1943 did not reflect an effort toward expansion. Southern Brazil reported a small increase for 1942–43 production, bringing the total for Brazil to about 2,081,000 bales. Egypt forecast for 1943 the lowest production since 1895, or only 708,000 bales. This change was due to the adjustment of Egyptian agriculture to the need for food crops and to avoid further increase in stocks. A record crop for Argentina was reported, but the total was not important, amounting to only about 500,000 bales. Reports from smaller producing countries were almost all toward a decline in production. What Japan was able to accomplish in the far east was unknown. Russia was unable to make important expansion of acreage because of the need for food crops. (J. C. Ms.)

Cremonesi, Carlo, CARDINAL (1866–1943), Italian ecclesiast, was born Nov. 4 in Rome. He studied at the Roman seminary, taught at the Pontifical college for the Propagation of the Faith for 20 years, and was a prelate of the Holy See, 1910. In 1921, he was named titular archbishop of Nicodemia and subsequently held other important administrative posts in the Holy See. He was papal secret chamberlain under Leo XIII and Pius X and was created cardinal, Dec. 16, 1935. He died on Nov. 25, according to a Vatican city broadcast.

Cricket. By the end of the season 1943 in Great Britain, it was plain that those who favoured the one-day match in the first class county championship, though they might be many in number and insistent of voice, were found but rarely among the members of the respective country clubs, to whose advice, as expressed by their committees, the Marylebone club turned in this matter. In July the Advisory County Cricket committee met at Lord's, and discussed the feasibility of the two-day match. On that, and on other kindred topics, the Marylebone club were to receive the advice of a sub-committee towards the end of 1943. A minority of the counties favoured the two-day scheme, as suggested by Sussex and Lancashire. The equable solution would seem to rest in one season of experiment at the end of the war.

Interest in the charity matches—chiefly for the Red Cross—at Lord's was greater even than in 1942 and reached its climax in a particularly fine game in early August when an England 11 beat a team from the dominions by 8 runs. The dominions had been set to make 360 to win in 4½ hr. A glorious century by the New Zealander, Lieut. C. S. Dempster, set them on their way; but defeat seemed near when C. B. Clarke, West Indies, joined Flying Officer S. Sismey, Australia. These two, adding 108, narrowly failed to achieve victory.

Oxford just saved the game against a stronger Cambridge team. The Eton *v.* Harrow match, played at Eton and confined to one day, was spoiled by rain, Harrow making 88 for 3 wickets. Among other matches between young cricketers, "The Rest" played a drawn game with "The Lord's Schools." In this match, very fine form was shown as a batsman by W. H. H. Sutcliffe, son of the noted England and Yorkshire player, Herbert Sutcliffe.

For concentrated excitement, perhaps the best cricket was to be found in the Saturday-afternoon league matches round Birmingham, in Lancashire, in Yorkshire and in North Staffs. In these matches were to be seen many of the cricketers, now serving in His Majesty's forces, whose names were familiar and established in days of peace. Of less technical excellence, but of perhaps more historic interest, were a few matches played between teams of United States troops stationed in England. Everywhere the game flourished, with an enjoyment all the keener for the thought of what might have been lost.

A tribute must be paid to the honoured memory of the world's greatest slow left-hand bowler, Capt. Hedley Verity of Yorkshire, who died of wounds as a prisoner of war in Italy. He was great, both as a man and as a cricketer. (R. C. R-G.)

Crile, George Washington (1864–1943), U.S. surgeon and scientist, was born Nov. 11 in Chili, Ohio. Early in his career as a surgeon, Dr. Crile developed the nerve-block system of anaesthesia and was believed to have been one of the first doctors to perform a direct blood transfusion. He established the Cleveland clinic in 1921, which was destroyed by fire eight years later. Dr. Crile's works included *The Surgical Treatment of Hypertension* (1938) and *Intelligence Power and Personality* (1941). He died in Cleveland, Jan. 7. (See *Encyclopædia Britannica.*)

Crime. By the midyear point of 1943, the temporary effects of World War II upon crime rates in the United States were becoming more clearly evident. The first year of the war (1942) saw an increase in murder, manslaughter, rape and aggravated assault, and declines in the number of robberies, burglaries, auto thefts and larcenies generally. Thus crimes against the person increased, while crimes against property showed a marked drop. Since crimes against property are many times more numerous than those committed against the person, the net effect of these divergent shifts was to reduce the general crime rate.

The tendencies noted during the first year of the war were extended into the second year—at least so far as June 30, 1943. Comparing the first six months of 1943 with the corresponding

period of 1942 (Table I), it is apparent that crimes against property were still declining, while the rise previously noted for murder and manslaughter was offset by a drop in 1943. Hence the general result of the war appears to have been to reduce the

Table I.—*Crimes in 1939-43*
(In 318 U.S. Cities of over 25,000 population)

Offense	Average 1939-1941	1942	January to June	
			1942	1943
Murder and Non-Negligent Manslaughter	2,632	2,673	1,264	1,183
Negligent Manslaughter	1,978	2,003	973	802
Rape	4,286	4,764	2,300	2,673
Robbery	26,965	24,370	12,821	11,836
Aggravated Assault	21,864	23,533	11,042	11,585
Burglary—Breaking or Entering	143,313	124,428	66,933	63,015
Larceny—Theft	388,309	377,105	196,473	160,025
Auto Theft	84,293	79,713	41,068	38,211

number of crimes in most categories, while marking up an increase for rape and aggravated assault.

On the basis of a large sample of crime returns in both urban and rural areas, the estimated total of "reportable offenses" (listed in Table I) for the entire United States in 1942 was 1,436,748. During an average day in that year 31 persons were feloniously killed, 27 were raped and 142 were attacked with a deadly weapon. Robberies averaged 129 per day, burglaries 729 and other thefts 2,416. In addition, 459 automobiles were stolen in the average 24-hour period. The estimated total of these crimes was 6.2 less in 1942 than in 1941.

Such offenses are not evenly distributed with reference to population. On the contrary, the New England, middle Atlantic and north central states consistently show lower crime rates than those for the rest of the country. The first half of 1943 was no exception to this general rule (Table II). As noted by many com-

Table II.—*Regional Distribution of Crime, January to June, 1943*
(Number per 100,000 inhabitants)

Geographic Divisions	Murder and Non-Negligent Manslaughter	Robbery	Aggravated Assault	Burglary—Breaking or Entering	Larceny—Theft	Auto Theft
New England	0.54	7.3	4.9	115.8	235.2	68.6
Middle Atlantic	1.30	9.9	14.5	92.0	182.0	44.2
East North Central	1.82	31.5	20.1	137.9	350.5	65.6
West North Central	1.66	10.4	12.0	113.4	318.5	56.8
South Atlantic	6.64	33.7	77.7	188.2	533.1	98.8
East South Central	8.20	32.5	52.3	201.1	441.6	91.9
West South Central	6.02	25.5	47.1	173.4	540.5	90.0
Mountain	2.08	31.8	15.9	223.6	702.9	119.7
Pacific	1.82	47.9	24.8	236.2	727.8	232.8

mentators, the persistently high crime rates of the southern tier of states are attributable largely, if not wholly, to the numerous crimes committed by and against Negroes in that area.

There is a pronounced tendency toward higher crime rates in the larger cities, as illustrated in Table III. Recent years, however, have shown what appeared to be a trend toward higher rates among Group II cities (between 100,000 and 250,000 population) than in Group I cities (over 250,000 population). A simi-

Table III.—*Distribution of Crime Rates by Size of Cities*
(January to June, 1943)

Offense	Population Groups of Cities (000 omitted)						
	I Over 250	II 100–250	III 50–100	IV 25–50	V 10–25	VI under 10	Gen'l Rate
Murder and Non-Negligent Manslaughter	2.86	2.82	2.67	2.01	1.30	1.89	2.48
Manslaughter by Negligence	1.74	2.26	1.49	1.46	0.74	0.79	1.53
Rape	6.67	5.60	4.69	3.89	4.25	3.48	5.46
Robbery	31.9	24.2	20.8	12.6	8.6	9.0	22.9
Aggravated Assault	27.2	28.1	29.4	26.8	14.5	13.3	24.6
Burglary—Breaking or Entering	167.2	193.7	150.7	134.0	111.7	92.8	148.6
Larceny—Theft	385.7	479.5	450.0	449.1	361.8	232.8	392.7
Auto Theft	86.5	111.7	81.5	73.2	62.0	48.2	80.9

lar pattern is traced for the first six months of 1943, with Group II cities in a leading position with respect to negligent manslaughter, burglary, auto theft and larcenies generally. In 1943, Group III cities (between 50,000 and 100,000 population) recorded the highest rates as to only one of the eight crime categories and were in second place as to another. Whereas in 1942 it appeared as though the Group III cities might be tending toward a higher status in the matter of crime frequency, the indications for 1943 are that this change in relative status will be delayed, if it has not already been offset.

The average loss, in terms of dollar value of property stolen, greatly increased in 1943 as to burglaries and larcenies (10.2% and 27.1%, respectively), but declined as to robberies (6.7%) and was virtually unchanged as to auto thefts. Net effect was that despite the decline in the number of crimes against property, the losses for 1943 were about as high for the first half of 1943 as for the corresponding period of 1942.

Robberies of oil stations and of banks greatly declined in number in 1943 (76.9% and 50.0%, respectively) while pocket-picking and purse-snatching markedly increased (26.2% and 19.9%, respectively). Forcible rape showed an increase of 14.4% during the first six months of 1943, as compared with the first half of 1942. The per cent of stolen cars recovered was 97.8 in 1943, as compared with 97.5 in 1942.

The *Uniform Crime Reports* entered their 14th year in 1943. In 1943, they included reports from 2,100 cities, towns and villages, having a combined population of 65,064,727. (*See* CHILD WELFARE; FEDERAL BUREAU OF INVESTIGATION; KIDNAPPING; LAW; POLICE; SECRET SERVICE, U.S.)

BIBLIOGRAPHY.—*Uniform Crime Reports* (semiannual bulletins) for 1942 and for the first half of 1943, Federal Bureau of Investigation; *Judicial Criminal Statistics, 1941*, U.S. Bureau of the Census (1943); *Prisoners in State and Federal Prisons and Reformatories, 1940*, U.S. Bureau of the Census (1943). (BR. S.)

Great Britain.—No precise survey of crime in Great Britain in wartime was possible owing to the withholding of official statistics, but it was known that the amount of crime during 1943 was one of the smallest on record. Some police and penology authorities attributed this mainly to the all-compelling demands of men for the armed services and full employment throughout war industries.

Murders were no more than during peace years. Cases of housebreaking dropped by a fifth. Those of armed hold-up, robbery with violence, "smash-and-grab" raids on shop windows, bag-snatching and assaults during blackout hours were far fewer than anticipated. Bigamy increased, defendants being mostly service men.

Rigorous official action in detection was believed to have broken the back of serious "black market" trading. Magistrates were empowered to increase sentences in cases of summary jurisdiction of "black-marketing" offenses from a maximum of 6 months to 12 months.

During 1943, juvenile delinquency in London rose at one period to 25% above 1938 figures. Figures for the metropolitan police area disclosed that 8 out of every 1,000 children between the ages of 8 and 17 were guilty of offenses. Over the country as a whole juvenile crime decreased, one Welsh county reporting a decline of 40% within 12 months.

There was no notable change in penal policy. An official effort was made to secure a younger magistracy for juvenile courts. Irregularities at one of these courts at Hereford, which led to the birching of a boy before an appeal against the sentence could be lodged, impelled an official inquiry and aroused a new public interest in the procedure of such courts and in birching as a punishment.

A movement arose among magistrates to extend the system of

releasing prisoners on probation to cover periods up to three years. (*See* also PRISONS.) (P. BN.)

Croatia. A "kingdom" formed from Yugoslavia in the northwestern part of the Balkan peninsula after the German aggression of April 1941, when Croats of the fascist terrorist organization "Ustasha" set up in Zagreb, the capital of Croatia, an "independent" Croat regime with Dr. Ante Pavelitch as head of the new state and as poglavnik (leader) of the Croat fascists. On May 17, 1941, the Italian prince Aimone was elected king of Croatia, yet he never dared to set foot on the soil of his new kingdom.

Croatia has an area of 44,453 sq.mi. with about 7,000,000 inhabitants, of whom about 5,000,000 are Catholic Croats. The Mohammedan minority in Bosnia enjoyed a privileged position.

The cruelty and lawlessness of the Croat regime continued to provoke incessant internal disorders and uprisings in 1943. During long periods whole regions of Croatia were held by guerrilla forces, especially those organized by General Tito (Josip Brozovich), who for some time had his headquarters in northwestern Bosnia, not many miles south of Zagreb. The surrender of Italy in Sept. 1943 made conditions worse. King Aimone was officially deprived of his throne by a proclamation of Ante Pavelitch on Sept. 10, and Croatia became a republic under German protectorate instead of a kingdom under Italian protectorate. Nikola Manditch, a Bosnian lawyer from Sarajevo, was appointed premier of the Croat government. The Croat troops fighting in Russia were brought home to fight the patriots. The Ustasha secret police was reformed, after a visit of Heinrich Himmler, under German leadership. The economic situation was far from satisfactory, food prices went up to fantastic heights and the black market flourished. Efforts to win over the former Croat peasant party and its leader, Dr. Vlatko Matchek, failed. (*See* also DALMATIA; MONTENEGRO; YUGOSLAVIA.) (H. KO.)

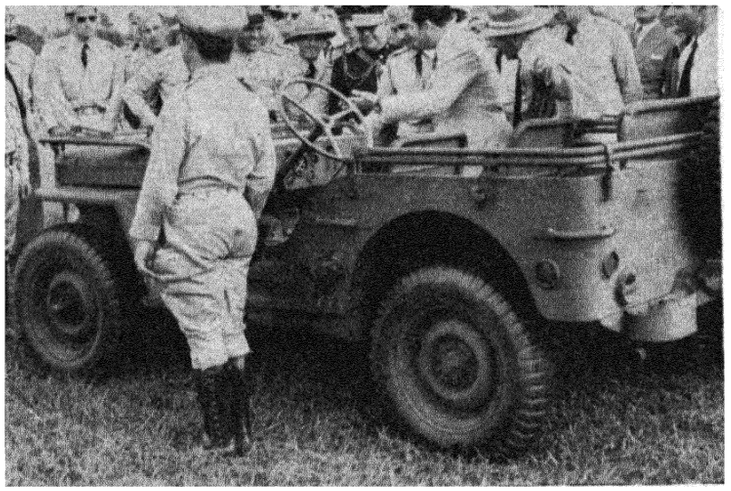
Crop Insurance: *see* AGRICULTURE.

Crowley, Leo Thomas (1890?–), U.S. government official, was born in Milton Junction, Wis. He attended the University of Wisconsin for a brief time, became salesman for a paper company at the age of 20 and president of the organization at 23. He subsequently held positions of importance in several financial institutions. He was called in to advise Secretary of the Treasury Henry Morgenthau when the Farm Credit administration was in the process of organization. He became regional administrator for FCA at St. Paul and was then chairman of the Federal Deposit Insurance corporation in Washington, 1934–39. Although he wished to leave to assume an executive post with a utilities firm, he heeded President Roosevelt's request to continue with the FDIC but received no salary for his work with the government. In March 1942, he also became Alien Property Custodian. This office, first instituted by President Wilson during World War I, had lain dormant in the department of justice for eight years before it was revived in 1942. An administration "trouble-shooter," Crowley came into the limelight in 1943 as a result of the quarrel between Vice-President Henry Wallace and Secretary of Commerce Jesse H. Jones. After President Roosevelt had chastised both members of his administrative family for airing their row, he removed agencies dealing with foreign economic operations from their control. Roosevelt then created a new superagency, the Office of Foreign Economic Warfare, and appointed Crowley administrator of this bureau in Sept. 1943.

Cruisers: *see* NAVIES OF THE WORLD.

Crumit, Frank (1889–1943), U.S. stage and radio star. After graduating from Ohio university he went into vaudeville. His informal act, featuring song and ukelele-strumming made him a star almost overnight. He appeared in a succession of musical comedies and played leading man to Julia Sanderson, whom he later married. The Crumits entered the radio field in 1928 and won nation-wide popularity as the "Singing Sweethearts of the Air." They inaugurated the "Battle of the Sexes" quiz program in 1930. Crumit died in New York city, Sept. 7.

Crushed Stone: *see* STONE.



Cryolite. No specific information was made public on cryolite after the occupation of Denmark by Germany and of Greenland by the United States, but apparently adequate amounts were being obtained from Greenland, since the supply was officially reported as sufficient to meet current war demands and essential industrial requirements. (G. A. RO.)

Cuba. A West Indian republic including the island of the same name, the Isle of Pines and other minor islands in its limits; total area: 44,164 sq. mi. Population (unofficial est., 1942), 4,420,000; a census was started in July, 1943, in preparation for the 1944 presidential election, but no reports were available at the close of 1943. The capital is Havana (pop. est., including suburbs, 783,000); other large cities (with est. pop.) are: Santiago, 152,000; Camagüey, 138,295; Cienfuegos, 92,258; Santa Clara, 99,509; Sancti Spiritus, 92,000; Guantánamo, 68,000. President in 1943: Colonel Fulgencio Batista.

History.—In the winter of 1942–43, Cuba was greatly concerned over sugar prospects. The 1942 sugar contract with the United States had been for 4,000,000 short tons, a good percentage of the normal crop of prewar years. Unfortunately, lack of shipping had resulted in a failure to move the entire amount, and Cuban warehouses still held 1,500,000 tons. One of the reasons for concern was uncertainty as to whether the United States would await delivery before making payment, or not; this worry was removed in Dec. 1942, by an agreement by which Cuba was given 95% of the value of the unshipped sugar. Another problem in the situation was the fact that not only would the U.S. have the stored sugar to draw upon in 1943, but the same sugar would substantially reduce storage space available. In February the two countries finally came to an agreement for the season's production, setting it at a total of 3,225,000 short tons of which the United States was to absorb 2,700,000 tons. The amount was well under that of 1942, but as liberal as could be expected under the circumstances.

In the first half of 1942, shipping conditions improved steadily and when Cuban representatives went to Washington for early negotiations over 1944 production, it appeared probable that most of the 1943 crop would be moved by the end of the year. In August an agreement was concluded whereby the United States contracted for 4,000,000 short tons. Cuba had desired an increase in price, in view of generally increasing price levels in wages and in living costs, but the price fixed was the same as that for the previous years ($2.65 per 100 lb.). It was agreed, however, that if prices of sugar should increase in the U.S., a percentage of such increase should go to Cuba. Attempts to dispose of 100,000,000 gallons of molasses were less successful as late as November, since prices obtainable were lower than Cuba was willing to accept. It was expected, however, that most of this product could be converted into gin for new markets opened by the liquor shortage developing in the U.S.

In the domestic political field, there was definite activity as Cuban parties began preparations for the presidential election

PRESIDENT FULGENCIO BATISTA of Cuba (centre, with arm extended) examining U.S. motorized equipment sent to the island in 1943

campaign of 1944. Under the Cuban constitution, President Batista would be ineligible (no president may hold more than four consecutive terms), and early in the year he announced that he was not a candidate. Cabinet reorganizations took place in March and April; in the ministry set up in March two parties (the ABC and Communist), formerly in opposition to the administration, were given representation. Some weakening of the government coalition developed in May, when Vice-President Gustavo Cuero Rubio resigned in order to head a newly formed party. Other leading candidates were Carlos Saladrigas, former premier and most likely administration candidate, and Ramón Grau San Martín, leader of the *Auténticos,* the strongest opposition party. The campaign promised to develop largely on personalities (frequently the case in Cuba) and on a few domestic issues.

Diplomatic relations between Cuba and Spain, somewhat strained in 1942, were improved in midsummer of 1943 by the arrangement of a convention looking toward the release of frozen credits dating back to the Spanish Civil War. The agreement promised to restore needed Cuban markets, notably for tobacco. Other diplomatic enterprises involved a new military and naval pact with the United States (Feb. 1) by which the two nations continued the co-operation of previous months. In this connection the two states agreed upon a mutual military conscription program. One of the reasons for a special legislative session in January was the arrangement of a treaty of amity with China. In March friendship of a closer neighbour was signified in the visit of President Rafael Calderón Guardia of Costa Rica.

Cuba's new military training program got under way in 1943. With registration in April, it was expected that 8,000 inductees would go into the army every four months. Earlier, because of shortage of officer material, President Batista had ordered recalled 48 former Cuban army officers who had gone into exile in 1933. The conscript army was not liable for service outside Cuba, and the administration emphasized the enlistment of several thousand volunteers who might serve in a possible expeditionary force.

War conditions still affected the island economy in 1943, in spite of an eased shipping situation. Price ceilings were set in July on various food items and on utility charges. A board of economic warfare was established in June, and censorship of all types of communication, in April. In August a postwar planning group was organized; Cuba's experience after World War I, when the bottom had dropped out of sugar prices, was a sore memory. In line with the advice of economic advisers, the government in October ordered the big Tinguaro sugar mill, damaged by fire and not repaired, put in operation at once under penalty of intervention by the government itself.

A national food congress was held in Havana in September, and Cubans interested in stimulation of diversified agriculture continued a program calling for the erection of refrigerator warehouses and dehydration plants. In July export of meat and charcoal was prohibited for a time, with the ban later partially relaxed. The widespread shortage of fuels and of rubber and manufactured articles affected transportation and the volume of retail sales.

Education.—In 1942, urban and semi-urban elementary schools numbered 4,227 lower primary schools, with 437,965 students, and 37 higher primary schools, with 7,741 pupils. Civic-rural schools (elementary level) numbered 1,113; enrolment, 57,050 pupils. There were 24 secondary schools with 18,664 students, and 4 arts and trades schools. The National university, at Havana, had an enrolment of 13,949.

Finance.—The Cuban monetary unit is the peso, officially set at par with the United States dollar. Revenue for 1942 was 95,724,000 pesos; expenditures 104,810,000 (with an additional appropriation of 16,000,000 pesos made to cover the deficit). The budget for 1943 was balanced at 89,993,595 pesos. The public debt (Jan. 1, 1943) was 118,416,000 pesos (111,099,000 external; 7,317,000 internal), not including a floating debt of over 50,000,000 pesos. In Oct. 1943, U.S. currency in Cuba totalled $164,016,729, and Cuban currency amounted to 121,847,112 pesos.

In January, the government was authorized to purchase $15,000,000 worth of gold from the United States as a reserve (plus $5,000,000 U.S. currency) for a new issue (20,408,000 pesos) of Cuban silver certificates. In March an additional 5,102,000 pesos of silver certificates were issued.

Trade and Communication.—No recent trade figures were available (1941 total value was $345,397,728), but statements issued indicated that imports for the first half of 1943 were 13% greater than in a similar period for 1942, and exports were up 26.4%. The Cuban trade balance with the United States for the first three quarters of 1943 was favourable in the amount of $103,518,000. Between 80% and 90% of Cuban trade is with the United States.

Cuba has extensive service with outside countries by sea and air. For the first half of 1943, air traffic with Miami, Fla., decreased, but inter-island traffic increased. A new air mail service to Mexico was started Jan. 1, 1943. Air express shipments (1942) amounted to 760,027 lb.; air mail to 119,227 lb. The railway system is 3,850 mi. in length (1942); the highway system amounted to 2,390 mi. improved roads and approximately 2,000 mi. unimproved. The highway maintenance appropriation for the 1942–43 fiscal year was 95,000 pesos, with 425,000 pesos available for construction. Lack of motor fuels affected transportation; by law, cars must use a mixture of 75% alcohol and 25% gasoline.

Agriculture.—The dominant crop is sugar and sugar derivatives. The 1943 crop was set at 3,225,000 short tons (1942: 4,016,000 short tons), of which 2,700,000 tons were taken by the U.S., 300,000 tons went to other export markets, and 225,000 tons reserved for domestic use. Tobacco production for 1942 was estimated at 51,400,115 lb., and it was expected that the 1943 crop would be about 16% above this figure. The 1943 banana export crop was estimated at 1,800,000 stems (1942: 2,245,000 stems), with disease affecting production. In 1942 Cuba produced 500,000 loofah (gourd) sponges.

An early season drought affected butter production (in 1942 butter exports had been 648,000 lb.; cheese exports, 959,000 lb.).

Minerals.—Cuban mineral exports for 1941 showed values of:

copper $1,329,346; manganese $6,510,131; iron ores $209,924; chromium ores $1,329,496. (*See* also WEST INDIES.)

(D. RD.)

Cudahy, John (1887–1943), U.S. businessman and diplomat, was born Dec. 10 in Milwaukee, Wis., member of a wealthy U.S. packing family. He was graduated from Harvard in 1910 and took his law degree at the University of Wisconsin, 1913. He practised law in Wisconsin until the U.S. entered World War I and then served with the A.E.F. in France. After the war, he resumed his law work and entered politics. He ran unsuccessfully for governor of Wisconsin, 1916, on the Democratic ticket, and was later a substantial contributor to the Democratic presidential campaign fund. After Franklin D. Roosevelt's election in 1932, Cudahy served successively as U.S. envoy to Poland, Ireland, Belgium and Luxembourg. He remained at his post in Brussels during the German invasion of the Low Countries, 1940, and later became an apologist for King Leopold III, whose capitulation evoked sharp criticism from Allied nations. Cudahy was killed Sept. 6, during a riding accident on his estate near Milwaukee, when he was thrown from his horse.

Cunningham, Sir Andrew Browne (1883–), British naval officer, commander of the British Mediterranean fleet after 1939, was born in Bishop's Waltham, Hants., England. He entered the royal navy in 1898. During World War I, Sir Andrew commanded the destroyer "Scorpion" and staged daring raids against enemy shipping in the Mediterranean. He was a rear admiral in 1933–36, and was made a vice-admiral commanding a battle cruiser squadron in 1937. He was also lord commissioner of the admiralty and deputy chief of the naval staff, 1938–39. In April 1940, Sir Andrew, aboard his flagship "Warspite," led a destroyer flotilla into Narvik fjord and sank seven German destroyers. Except for the Narvik battle, he had most of his naval experience in the Mediterranean, of which he was said to know every bay and inlet. At the outbreak of war in 1939, he was made commander in chief of the Mediterranean fleet, which played an important part in the North African and Italian victories. In June 1942, he was made a baronet, and in January 1943, he was promoted to the rank of admiral of the fleet. He succeeded Admiral Sir Dudley Pound as first sea lord and naval chief of staff in Oct. 1943, being replaced in the Mediterranean by Sir John H. D. Cunningham.

Curaçao. A Caribbean colony of the Netherlands, composed of the islands of Curaçao (210 sq.mi.), Bonaire (95 sq.mi.), and Aruba (69 sq.mi.) in the Leeward group some 40 mi. off the coast of Venezuela, and in the Windward Islands, St. Eustatius (7 sq.mi.), Saba (5 sq.mi.) and the southern portion of St. Martin (17 sq.mi.). The total area is 436 sq.mi. The total pop. (1941 official est.) is 109,592 (Curaçao Island, 68,217; Aruba, 31,522; Bonaire, 5,556; St. Eustatius, 1,146; Saba, 1,213; St. Martin, 1,938). The official language is Dutch; the majority of the inhabitants are Roman Catholics. Willemstad (pop., 1939 est., 31,264), on the island of Curaçao, is the capital. The colony is administered by an appointed governor and a majority-elected council. The governor in 1943 was Dr. Pieter A. Kasteel.

History.—Curaçao continued to be important in the war effort because of petroleum production, and an expansion of refining facilities took place during 1943. The colony was still affected by shipping shortages, and scarcity of some items was reported as well as a 50% increase in price levels. Maximum prices were set on essentials early in the year, and by March food cards had been issued in prospect of later food rationing. Due to the rise in living costs, government and refinery employees on Aug. 31 were given a 30% wage increase, retroactive to July 1, 1943.

DUTCH MARINES In Curaçao

Venezuela military observers, sent under mutual agreement with the colonial administration, arrived in Curaçao in March.

Education.—The school system possessed 49 elementary schools (1938) with an enrolment of 11,044.

Finance.—The monetary unit is the guilder (value in 1943 approximately 54 cents U.S.). After Jan. 1, 1943, a new currency went into use and United States paper currency was no longer allowed in circulation. The new coinage was minted in the United States. The 1944 budget estimated ordinary revenue at 17,748,417 guilders, and extraordinary revenue at 7,166,084 guilders; current expenditures at 13,220,793 guilders, and extraordinary expenditures at 7,690,240 guilders.

Trade and Resources.—The main resource of the colony is the refining of crude petroleum (primarily from Venezuela) on Aruba and Curaçao, with the large refineries further expanded during the year. This industry accounts for practically the entire export trade of the islands, and most of the import trade. No wartime statistics were made public; in 1938 petroleum product exports were valued at 151,026,135 guilders, petroleum imports at 138,740,326 guilders. Other imports are largely foodstuffs and manufactured items, with most articles (except meats from Argentina) coming from the United States in 1943. Phosphate mining was at a standstill, since supplies on hand were sufficient to meet demand for some time to come. Because of labour shortage the harvesting of aloes ceased in September with only 75% of the crop gathered (approximately 3,000 cases). In normal times there are small exports of hides and skins, Panama hats, crude salt, orange peel and divi-divi for tanning.

Communication.—Both Aruba and Curaçao have good connections with the outside world by air and steamer lines. Communication with the other islands is largely by small vessels. On Dec. 3 an air line from Curaçao to St. Martin was opened; on

Dec. 20 the first direct radio-telephone line to the United States went into operation. (*See* also HISPANIC AMERICA AND WORLD WAR II.)

Curling. Skipped by novelist Ben Ames Williams, the Country club of Brookline, Mass., won both the Mitchell and Allen medals in the Grand National Curling club tournament. It marked the first time in 12 years that one rink had won both medals, a Brookline entry having last scored a double in 1931. Novelist Williams' curlers defeated another Brookline rink, 15–10, to win the Mitchell medal, and out-stoned Utica, N.Y., 14–9, for the Allen medal. The Country club of Brookline added further to its curling honours by winning the Dykes trophy, awarded to the winner of the junior rink event. Brookline defeated Utica, 17–5, in the Dykes final. Junior curlers are those who have not competed regularly in the Grand National. In the annual competition between the United States and Canada, the latter won the Gordon International medal. Detroit won the Waterloo trophy in the annual Ontario bonspiel at Toronto, defeating the Hamilton Victoria rink, 17–13, in the final.

(M. P. W.)

Currency: *see* COINAGE.

Curtin, John (1885–), Australian statesman, born Jan. 8 at Creswick, Victoria, Australia. Educated in the state schools, Curtin later became actively engaged in politics and labour journalism. As general secretary of the Victorian Timber Workers' union, 1911–15, and editor of the *Westralian Worker,* 1917–28, he became an exponent of the Australian Labour party's dual traditions of nationalism and theoretical socialism. During World War I, he was secretary of the anticonscription campaign. He was a member of the Australian house of representatives, serving from 1928 to 1931 and again from 1934 to 1941. During the latter period he was leader of the Federal Labour party and the parliamentary opposition. He succeeded Arthur Fadden as prime minister of Australia Oct. 3, 1941.

Throughout 1942 and early 1943 Curtin stressed the danger of invasion and warned the Allies against underestimating Japanese power. To prevent such an invasion by carrying the war to the enemy he sponsored a bill allowing conscripted troops to be sent outside Australian territory. The bill was passed in the senate Feb. 18, 1943, but was later defeated in the house. On June 7, Curtin announced his belief that the danger had passed. On June 24 a vote of nonconfidence in the ministry was defeated, and on Aug. 21 the party was re-elected.

In a speech made at Adelaide Aug. 14, Curtin proposed that an empire council be established to discuss matters of empire policy.

Cycling. With bicycles on the war ration list and with most of the riders in the service of their respective countries, cycling activity was reduced to a minimum for the year 1943, and for the second year, the names of existing champions based on the last year of competition (1941) were kept on the record books. For the fourth year the colourful and popular international six-day bicycle race was called off. Similarly there was no competition for world titles and cycling organizations such as the American Bicycling league of America, the National Cycling association and the Century Road club were without competition. However, an encouraging announcement was made by Cy Panitch, president of the Bicycle Club of America, who said that membership in that organization had increased 25% in 1943.

Furman Kugler, second ranking rider in America, won the New Jersey state cycling championship, in one of the rare title events, with a total of 16 points, having finished first in the 5-mi. and 10-mi. races sponsored by the Amateur Bicycle league of America.

A summary of the 1941 records, which still stood in 1943, follows:

The N.C.A. sprint championship was won by Tom Saetta of Brooklyn, while Mike DeFilipo of Newark won the paced title. The A.B.L. senior road championship was won by Marvin Thompson of Chicago, and the junior title went to Andrew Bernadsky of San Francisco. The girls' champion was Jean Michels of Chicago.

The track championships of the A.B.L. were won by Bob Stauffacher of San Francisco, who triumphed in the senior class, and Chuck Edwards of Chicago, winner among the juniors. Stauffacher also captured the Century Road club's senior title.

The A.B.L. of America selected an all-American cycling group as shown in the table.

Name	*City*	*Points*
George Hurlburt, Jr.	Buffalo	275
Furman Kugler	Somerville, N.J.	195
Jerry Kandler	Milwaukee	190
Iggy Gronkowski, Jr.	Buffalo	115
George Woof	San Francisco	98
Johnny Weber	Milwaukee	85
James Dolle	Irvington, Ind.	84
Isamer Fiyuyama	Honolulu	79
George Edge	Philadelphia	74
Harry Naismyth	Somerville, N.J.	67
Bruce Burgess	Irvington, Ind.	65
Francis McCabe	Honolulu	64

Other events in 1941, the last of their kind to be held for the duration, included an international bike race over the Inter-American highway from Tegucigalpa, Honduras, to Guatemala City. The Guatemala team won with Fraterno Vila, 18-year-old star, pedalling at the rate of 15 m.p.h. Tommy Hayes of Dallas, Texas, won the seventh annual national 100-mi. motorcycling championship, winning in the amazing time of 1:15:46.51. Also, the six-day bike race which was held in Montreal, Canada, was won by the team of Angelo DeBacco of Newark, N.J., and René Cyr of Montreal. Second place was taken by the popular team of Jules Audy of Montreal and Cecil Yates of Chicago.

Cyprus: *see* MEDITERRANEAN, BRITISH POSSESSIONS IN THE.

Czechoslovakia. Czechoslovakia, a republic in central Europe, was dismembered in 1938–39 as a result of axis aggression (*see* BOHEMIA AND MORAVIA; SLOVAKIA). The area of Czechoslovakia was 54,244 sq.mi., the pop. (1930 census) 14,729,536. The Czechoslovak government was reconstituted in 1940 in England and recognized by all the Allies as a member of the United Nations. President (1943) Dr. Eduard Beneš; prime minister, Msgr. Jan Šramek.

History.—During 1943 the Czechs and Slovaks in their homeland continued the struggle for national liberation. Their hopes there were concentrated upon their government in England, upon the Czechoslovak army trained in Great Britain, and upon the reconstitution of the democratic Czechoslovak republic through the defeat of Germany. On Aug. 5, 1942, the British government officially repudiated the Munich agreement of Sept. 1938, and thus recognized Czechoslovakia's frontiers as of before Sept. 1938. The soviet union took the same line.

The Czechoslovak government in London represented all the different elements of the republic—Czechs, Slovaks and the Carpatho-Russians of Ruthenia. The latter were represented by two members in the Czechoslovak state council, Dr. Pavel Cibere

and Ivan Petrusčak, an active trade union journalist. Though Ruthenia is inhabited by a population related to the Ukrainians and Russians, the soviet government officially recognized Ruthenia as part of Czechoslovakia. The soviet union raised its minister to Czechoslovakia to the rank of ambassador, and on Jan. 29, 1943, the soviet ambassador Alexander Bogomolov presented his credentials to President Beneš, accompanied by two counsellors and the military attaché of the embassy.

Throughout the year Czechoslovakia maintained the most cordial relations with all the leading United Nations. Msgr. Jan Šramek, the premier of the government, broadcast on Sept. 2, the fourth anniversary of the war, a message to Czechoslovakia in which he said: "We wish to deepen our bond of alliance with Great Britain, the United States, and with France, whose return to the ranks of the great European powers we consider absolutely essential. We also wish to continue in our close collaboration with the soviet union and we believe it unconditionally necessary for Russia to take a permanent part in the European politics."

The wise and moderate policy of the Czechoslovak government strengthened Czechoslovakia's diplomatic position and prestige among the United Nations. In pursuance of this policy President Beneš arrived on Dec. 11, 1943, in Moscow to sign a treaty of friendship between Czechoslovakia and the soviet union. He was received with extraordinary honours, and the soviet government made clear the great importance which it attached to its relations with Czechoslovakia, thus cementing the long-lasting friendship between the two countries. On Dec. 12 Foreign Commissar Molotov on behalf of the soviet union, and the Czechoslovak ambassador Zdeněk Fierlinger on behalf of his republic, signed a treaty of friendship, mutual assistance and postwar collaboration between the two countries. Like the British-soviet treaty of 1941, the agreement was concluded for 20 years, and for additional periods of five years if not renounced by one of the parties 12 months before expiration.

The two powers promised mutual assistance in the war against Germany and her satellites, as well as postwar collaboration. They pledged not to enter into negotiations with any German government which did not renounce aggression explicitly, and in the postwar period to render mutual military assistance in case Germany resumed the *Drang nach Osten* policy. Both countries promised noninterference in the internal affairs of the other state.

It was of highest importance that the two countries declared the treaty open for a third power, bordering on the two states and an object of German aggression, to join the treaty, thus making it a tripartite agreement. This invitation was aimed at Poland, with whom Czechoslovakia had entered into an agreement on Jan. 23, 1942, and with whom the Czechoslovaks wished to establish the most favourable relationship. Upon leaving Moscow Dec. 22, President Beneš told the press that his government and the soviet union hoped to reach an agreement with Poland concerning a stable peace and steps to prevent future aggression by Germany.

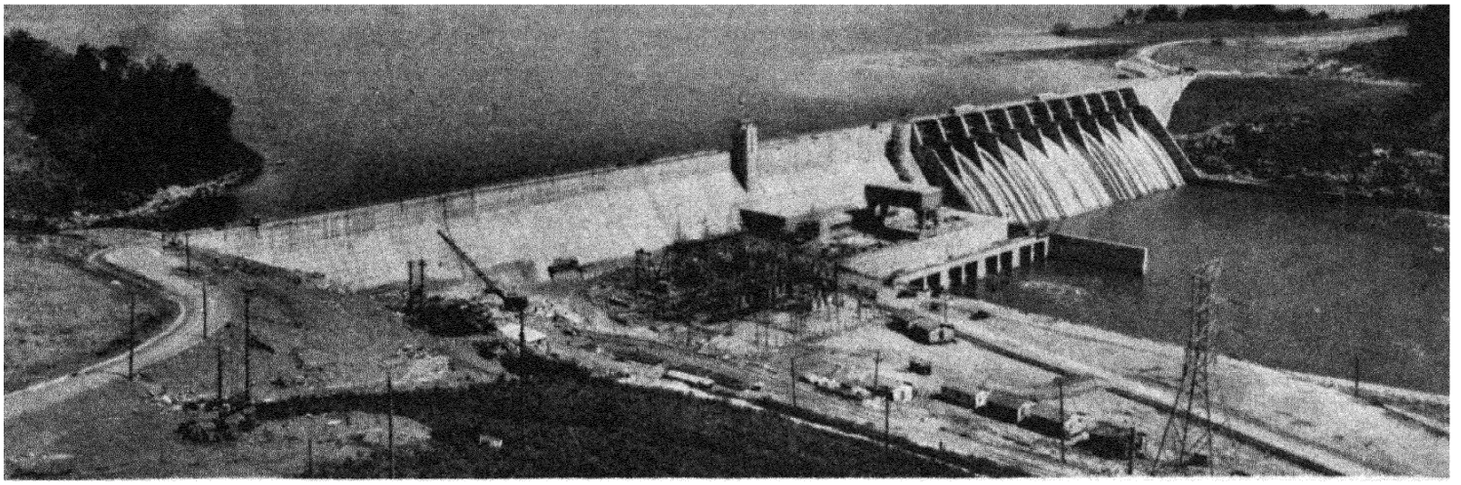
Dafoe, Allan Roy (1883–1943), Canadian physician, was born May 29 at Madoc, Ont., the son of a country doctor. He took his degree in medicine at the medical school of the University of Toronto in 1907 and practised in several Canadian mining towns before settling in Callander, an Ontario lumbering community. On the morning of May 28, 1934, he was called to the farmhouse of Oliva Dionne, a French Canadian farmer, to attend a childbirth. In the short space of an hour, Dr. Dafoe delivered five baby girls to Mme. Dionne Convinced that the infants could not live, he baptized them separately. The children, however, did survive, and then Dr. Dafoe realized that in delivering quintuplets, he had made medical history. He became legal guardian of the five Dionne babies, but resigned in 1939 because of friction with the parents of the children. Thereafter, Dr. Dafoe devoted most of his time to the children in his capacity as a personal physician. He became nearly as famous as his five protégées and his life was fictionalized in moving pictures. He died of pneumonia in a hospital at North Bay, Ont., June 2.

Dahomey: *see* FRENCH COLONIAL EMPIRE.



Dairy Industry, Bureau of: *see* AGRICULTURAL RESEARCH ADMINISTRATION.

Dairying. The number of milk cows in the United States at the beginning of 1943 was estimated by the U.S. department of agriculture to be 26,946,000 head compared to 26,398,000 head in 1942 and a 10-year average of 25,316,000 head. The number in 1943 set a new record but only a little more than equal to the high point reached in 1934. The increasing demand for dairy products caused an improvement in the breeding and feeding of the dairy cattle, thereby increasing production more than merely by the increase of numbers. An increased number of heifer calves were being kept for cows, indicating a continued increase through the year. The severe shortage of dairy feeds, particularly in the greater dairy states, caused the marketing of a large number of cows and calves. The feed shortage also reduced the milk production per cow toward the end of 1943. The amount of the more concentrated feeds used was less than in 1942 because of the great difficulty in buying these feeds in the New England states. In the corn belt, heavy feeding was practised though the amount of milk produced was not equal to that of 1942.

The milk production of 1943 was about the same as in 1942, being estimated at 118,000,000,000 lb. compared to 119,240,000,000 lb. in 1942 and the 1937–41 average of 107,903,000,000 lb. The expansion of fluid milk consumption caused a reduction in the manufacture of cheese and dried and evaporated milk in 1943. Consumption of fluid milk in large cities was estimated to be 15% above the 1942 level and 34% above the 1935–39 average. The War Food administration asked the dairymen for a production of 122,000,000,000 lb. of milk in 1944, which would require 2% increase in the number of cows and better feeding in order to produce at least 50 lb. more of milk per cow. (*See* also BUTTER; CHEESE; MILK.) (J. C. Ms.)

Dalmatia. A Yugoslav province, formerly a part of Austria, on the northeastern shore of the Adriatic sea, inhabited by Croats. When Yugoslavia collapsed under German aggression in April 1941, part of the Dalmatian coast, including the important naval ports of Cattaro and Spalato, was directly annexed by Italy, while a smaller part, including Ragusa, became officially part of Croatia, but was put under Italian military control.

This Italian military control came to a sudden end in 1943, when Italy surrendered to the Allies. A small part of the Italian army joined the Yugoslav patriot forces, the arms and supplies of some Italian divisions fell into the hands of the Yugoslav guerrillas, while the occupation of the country was taken over by the German army. The incessant warfare which Serb and Croat patriots had formerly waged against the Italian forces of occupation were now resumed against the German forces of occupation. The Partisan army under General Tito (Josip Brozovich) succeeded even in capturing for a short time Spalato and other important cities of the Dalmatian coast, but had to abandon them

DOUGLAS DAM of the Tennessee Valley authority on the French Broad river in eastern Tennessee, was placed in operation in March 1943 after a record-breaking construction period of 12 months and 19 days. The dam is 161 feet high and 1,682 feet long and was built at a cost of $36,500,000

under increased German pressure. (*See* also CROATIA; MONTENEGRO; YUGOSLAVIA.) (H. KO.)

Dams. On May 17, 1943, the royal air force attacked and severely damaged the Möhne, Sorpe and Eder dams in Germany, releasing at least 75% of the stored water and causing the most severe floods on record in the Ruhr valley and along the Rhine river below Duisburg-Ruhrort.

Several 1,500 lb. mines were dropped against the upstream face of the dams from planes flying over them at altitudes of less than 100 ft. to enable accurate placing of the explosives. After repeated attacks for more than an hour, in the face of heavy anti-aircraft fire from gun emplacements on the dam itself, a breach about 100 yd. wide was made in the centre of the Möhne dam. The Eder dam was broken down in two places, making a breach almost as wide as at the Möhne dam. The Sorpe dam was also breached.

The Möhne dam, a curved gravity structure of stone masonry, 131 ft. high and 2,132 ft. long, was built in 1913, creating a reservoir of 110,255 ac.ft. capacity. The Sorpe dam, 197 ft. high, created a reservoir of 65,666 ac.ft. capacity. Together, the Möhne and Sorpe dams controlled almost three-fourths of the Ruhr river watershed and about two-thirds of the water storage in the industrial area of the Ruhr.

The Eder dam, a curved gravity concrete structure, 157 ft. high and 1,312 ft. long, was built in 1914, creating the largest reservoir in Europe with a capacity of 163,760 ac.ft. It controlled the flow of the Weser river for navigation and flood protection. This reservoir was completely emptied through the breach.

Besides the damage caused by the flooding of industrial plants and the sweeping away of bridges and railway embankments, the loss of this tremendous amount of storage seriously affected some 300 waterworks and pumping stations, extensive canal systems for navigation, and many hydroelectric plants, the backbone of this great industrial region of Germany.

In the United States, at the Central valley project in California, construction of Shasta dam, second largest concrete dam in the world, was over 80% complete by April 1943, with 5,000,000 cu.yd. of concrete in place.

In the Tennessee valley, construction of Fontana dam, largest and highest concrete dam east of the Rocky mountains and world's fourth largest concrete dam, was over 50% complete on Nov. 1, 1943, with 1,500,000 cu.yd. of concrete in place and construction proceeding at the rate of 200,000 cu.yd. of concrete per month.

Douglas dam, also in the Tennessee valley, was closed and filling of the reservoir started by Feb. 1943, 13 months after authorization of construction. This remarkable accomplishment was made possible by the fact that Douglas dam was almost an exact duplicate of the concrete section of Cherokee dam, completed in 1942, and it was possible to use the same plans and

Chief Dams Completed or Under Construction During 1943

construction equipment with only slight changes.

The Mexican national commission of irrigation completed work in 1943 on the main structure of El Azucar dam, an earthfill four miles long on the San Juan river. Much work remained, however, on the spillway which has a capacity of 706,000 cu.ft. per sec. In Argentina, the Medrano dam, a low diversion dam on the Tunuyan river, was replaced by the Tiburcio Benegas dam to irrigate 132,145 ac. The Kariba dam, proposed as a postwar project by the government of Southern Rhodesia, was to be built in Kariba gorge of the Zambesi river, 200 mi. below Victoria falls, to provide hydroelectric power and water for irrigation.

The table on page 221 includes 20 of the many important dams of the world completed or under construction during 1943. (*See* also AQUEDUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY.)

(B. O. M.)

Dance. **Ballroom.**—In 1943, schools throughout the U.S. reported heavy enrolments in social dancing, far exceeding those of the "dance-boom years" prior to and during World War I.

People always dance more in wartime than in peacetime. It's the natural reaction to tense times. But never before had the urge to do a little plain and fancy rug-cutting been so widespread as in 1943. It was a year in which ballroom dancing stepped far beyond its former role of social pastime and became many things to many people.

In 1943, people who had never taken a rhythmic step before in their lives turned to the dance floor. Staid civilians, heretofore content to fill spectator roles, took up dancing—for relaxation, for escape, as a panacea for war nerves and a release for pent-up emotions. The U.S.O. halls, canteens, and various centres where service men gathered accented dancing as a means of recreation and fun. Defense plants all over the country discovered in music and dancing an antidote for clock-watching, fatigue, absenteeism.

In a recent survey of defense plants—where the debutante worked side by side with ex-stenographers and home girls—it was found that music and dancing speeded up production at least 8%. The workers danced during rest periods and lunch hours, and by the end of 1943 there were approximately 2,000 plants in the U.S. fully equipped with special floors, recorded music, loudspeakers and various other "ballroom" facilities.

The urge to dance came from the workers themselves. It was a way of expression the initiated saw coming long before U.S. entry into the war. At that time emphasis was placed on participation or group dances which were later to become favourites in U.S.O. centres and other gathering places frequented by service men. The participation dances are conducive to "mixing," and are therefore infallible ice-breakers. They were favourites in both civilian and military circles and bade fair to remain popular for the duration.

YOUNG MALE AND FEMALE REACTIONS to the "jive" dance music of Harry James during a concert in a New York theatre in April 1943. James was the year's favourite bandleader of the nation's "jitterbugs"

The war brought this development in the modern dance: a tempo either very slow or very fast. There was no middle-ground—the medium tempo was in 1943 practically extinct. Examples of this trend were the fast fox trot, danced to the rousing, swashbuckling "Pistol-Packin' Mama," and the slow fox trot, timed to the dreamy and sentimental "People Will Say We're in Love." It remained for Salt Lake City to coin the most amusing name for the slow-motion fox trot: "Holy Kiss Dance."

Perhaps because the fox trot is an adaptable step which can fit into either fast or slow tempo, it stood out as the most popular modern dance in 1943. There were flares of interest in the tango and the polka during 1943, but these dances seemed definitely on the wane. The once-popular conga was scarcely more than a vague prewar memory.

The rumba continued to gain adherents, especially among younger dancers. The radio and the movies carried the lilting rumba rhythms far into the hinterlands, and the dance became nationally known and generally popular. The tango, introduced by the Vernon Castles shortly before World War I, had no such means of exploitation—and never won such widespread popularity. Sharing favour with the rumba was that lively, challenging newcomer, the samba. The samba, a product of Brazil, gained new impetus after it had been nationally exhibited in a Walt Disney short.

Perhaps one reason why the samba and the rumba continued to hold the affection of dancers was that they allowed for much originality among individual couples.

The year 1943 saw a renewed interest in that most romantic of all dances, the waltz. This dance, which only a few years before was monopolized by the older generation, found increasing favour with the young. People of all ages were waltzing in 1943. The cause was not hard to find. Never before had there been such a wealth of romantic tunes, or such a wholesale revival of the old familiar waltz melodies. People like to hear the old familiar songs, and to dance the old familiar steps.

But the rumba and the waltz were, after all, created in other countries. The American spirit of nationalism still stood firmly behind the appeal of the jitterbug steps that originated on native soil. So strong was that appeal that *Life* magazine in Nov. 1943, devoted its front cover and nine full pages to the jitterbug, hailing the "Lindy Hop" as "the true national folk dance of America." Because of its strenuous routine, this type of dance was usually indulged in by the young, whose exuberance it expressed so well.

For many seasons it was possible to tell from what section of the country a "rug-cutter" came, simply by the step he did and the name he called it. There were any number of picturesque versions of the "Lindy Hop," which is the basic, nationally known jitterbug routine. Each section had its own pet steps. In Los Angeles there was the "Balboa," and in various parts of the country there were jive dances bearing such provocative titles as "Jersey Jump," "Flea Hop," "Jig Walk," etc.

But, with the war, New Yorkers suddenly found themselves in military camps and defense centres all over the country. Girls and boys from small communities invaded large cities by the hundreds of thousands. On bleak plains and in barren spots, mushroom cities surrounding defense plants sprang up overnight. There was no time for sectional differences. The Jitterbug steps done in Manhattan were learned and adapted by young people

from every state in the union—and they, in turn, gave out steps of their own improvisation.

The result was a surprising standardization of a dance whose chief characteristic had been diversity. The jitterbug, still in a stage of transition, began to fall into a definite pattern. It was no strange thing in 1943 to see a girl from Indiana or Texas dance with a boy just arrived from New York and never miss a step.

Arthur Murray, at the request of the Office of War Information, created two special participation dances. One of these, "The Victory Walk," is danced to marching tempo. The other, created for the tune, "Praise the Lord and Pass the Ammunition," is equally lively and gay. Despite the fact that these dances won national approval, they did not sweep the country off its feet. Nor was this surprising. It is an established fact that dances born in wartime are shortlived. Steps popular before the war continued in favour. Before World War I the Vernon Castles popularized the "animal" dances, such as the "Bunny Hug," "Lame Duck," "Turkey Trot," etc. It was not until 1919 that new rhythms and steps made their appearance. (A. Mu.)

Ballet.—U.S.O. shows used all types of dancing and dancers, and found the men in the service highly appreciative of the best. At the performance of the Ballet Russe de Monte Carlo at Fort Monmouth, Fort Hancock, etc., the dancers were received with the greatest enthusiasm by the soldiers. At the New York City American Theatre Wing canteen, alone, at least 520 dancers appeared.

The department of agriculture in its 1943 educational drive for food conservation and against the black market, used the dancer, Tamiris, in a principal role in its dance-play, "It's Up To You."

In the defense plants, the "Lunchtime Follies," directed by Lil Liandre, relaxed, delighted and educated the workers with popular and serious dance acts.

Throughout the country local dancing teachers organized their advanced pupils into performing groups and sent them to nearby camps, canteens, soldiers' hospitals and war benefits. Hundreds of schools gave at least one performance every week as their contribution to morale.

In the entertainment world of theatre, movie and concert, dance also became more popular through the need of lively, colourful, dynamic entertainment. Almost every Broadway show had a featured dance attraction and many had full fledged ballets by leading choreographers. To mention just a few such "hits": (1) *Carmen Jones,* ballet by Eugene Loring; (2) *Early to Bed,* premier dancer Jane Deering playing leading ingenue and dancing role; (3) *Oklahoma!* ballet by Agnes de Mille; (4) *One Touch of Venus,* ballet by de Mille; (5) *Rosalinda,* ballet by William Dollar; (6) *The Merry Widow,* choreographed by Balanchine with incidental dances by leading ballet stars.

In rehearsal for 1944 were shows with ballets by Massine, Arthur Mahoney, Tamiris, Catherine Littlefield, Charles Weidman and others.

The Metropolitan Opera company faced the criticism of long standing at the historic Opera Guild's Round Table discussion headed by Mrs. John de Witt Peltz. Agnes de Mille, Anton Dolin, La Meri and Alexis Dolinoff helped to point out the causes of criticism of the ballet at the "Met." One admirable outcome of the discussion was that Marina Svetlova, a real prima ballerina, was acquired by the "Met."

Touring dance companies did a sell-out business but suffered considerably from travel conditions. The Ballet Russe de Monte Carlo started its season on the road without a New York opening. It presented four new ballets including *The Red Poppy* by Schwezoff, *The Cuckold's Fair* by Pilar Lopez, *Etude* by Nijinska and *Ancient Russia* by Nijinska. Lubov Roudenko and M. Mladova left the company to be featured in Broadway attractions.

Ballet Theatre had its usual opening season at the Metropolitan Opera House, presenting the following new ballets: *Fair of Sorochinsk* with choreography by Lichine, *Dim Lustre* with choreography by Tudor, *Pictures of Goya* with choreography by Argentinita, and *Mademoiselle Angot* with choreography by Massine. The most noteworthy of these was the one by Argentinita, adding as it did a brilliant, varied and artistic episode in the best Spanish manner.

The illness of Alicia Markova gave opportunity to Alicia Alonzo to play the leading role in *Giselle*; to Nora Kaye in *Romeo and Juliet*; and to Rosella Hightower as the Swan Queen in *Swan Lake.* After the New York season was over, Nana Gollner with her husband, Paul Petroff, joined the company from South America. Irina Baronova took a leave of absence from the company in the spring but did not return in the fall. Karen Conrad and Sono Osato also left the company for Broadway contracts.

Colonel W. de Basil's Original Ballet Russe was practically disbanded when Colonel de Basil made an arrangement with the Teatro de Colon in Buenos Aires, Arg., to become its director and retain only about a dozen members of the company as a resident ballet.

Mia Slavenska, erstwhile ballerina of the Ballet Russe de Monte Carlo, started her own dance ensemble and opened her cross-country tour of 70 bookings the last week in 1943. Her program consisted of divertissement, classic, character and modern with a new 30-minute ballet, *Belle Starr.* Slavenska's partner was the young American dancer and choreographer, David Tihmar. Slavenska and Tihmar shared honours not only as soloists but as choreographers of the company. Other members of the company were Jack Gansert, Norma Vaslavina and Audrey Keane.

Another new company to make its debut late in the year was the American Concert ballet, a group of young dancers and choreographers who banded together in a co-operative enterprise to produce an outstanding program of four ballets: *The Five Gifts of Life* by William Dollar, *Mother Goose Suite* by Todd Bolender and *Sailor Bar* by Mary Jane Shea. Balanchine lent the company his blessing and his ballet *Concerte Baroco* to Bach music.

Edwin Strawbridge's *America Dances,* a ballet on American history, started on tour for young audiences in December. Miriam Marmein continued her yearly coast to coast tour presenting drama dances. Angna Enters continued to paint, write books and give recitals. La Meri moved to larger quarters and opened an intimate theatre where she continued her fortnightly performances of the ethnologic dance. Martha Graham gave a Broadway recital after two years' absence. Ruth St. Denis worked in an aeroplane plant for a while in Los Angeles "to do her bit," but later devoted her entire time to teaching classes in "temple dancing." Ted Shawn conducted his summer school at Jacob's Pillow with a faculty representing many phases of the dance. The Duncan Guild continued to grow and present conferences and recitals on the work of Isadora Duncan. Many schools and colleges ran special dance sessions with special dance faculties. National Dance week was celebrated for the ninth consecutive year throughout the U.S

In soviet Russia the soldiers continued to dance behind the lines to keep up their health, spirits and courage. The soviet government considered dancing so important that it frequently sent lengthy cablegrams to the American press about its new ballets and their dance artists. The periodic dance festivals were

observed under any and all conditions. The leading dancers went to the front continually to entertain the soldiers and the famous tripartite conference took time out to see the soviet ballet dance "Swan Lake."

The Sadler's Wells ballet carried on in London and in the provinces with the biggest audiences ever known. New ballets were added and the prewar favourites continued. The Ballet Rambert carried the dance to the defense workers with signal success. The Jooss ballet, with a company of 26, established themselves in a new headquarters in the Arts theatre at Cambridge, and from there toured the country with two new ballets as well as old favourites redone with their erstwhile brilliance. Ballroom and folk dancing continued to flourish in England and the London *Dancing Times* reached America regularly each month.

In the United States, *Dance Magazine*, published by Rudolf Orthwine, who took over the *American Dancer* and *Dance* and made them into a new magazine in 1942, continued its policy of representing the whole field of the dance. It added a Teachers' edition that dealt with technical information for the professional and a Skating department edited by Alan E. Murray, the skater who first translated Cecchetti to the skating world.

Certainly skating was slowly but surely becoming the dance on ice. What is more, Gloria Nord, lead in the Roller Skating show, was an erstwhile dancer and referred to as the rollerina and ballerina on wheels.

Catherine Littlefield, ballet dancer and choreographer, officiated in 1943 at the Center Theatre Ice show and Sonja Henie's yearly extravaganza. Dance producer Chester Hale choreographed the "Ice Capades" and dancer Harry Losee the movie version.

There were functioning versions of local civic dance groups of varying sizes and excellence from the full time performance San Francisco Ballet company to the creative children's ballet companies that gave one or two performances a year. In 1943, the Dancing Masters of America under the leadership of Anna M. Greene gave the movement new impetus by sponsoring the organization of civic ballet by its local clubs throughout the country. (L. MH.)

Danchenko, Vladimir Nemirovich (1858?–1943), Russian dramatist and director of the Moscow Art theatre, was born in Tiflis. A successful writer of novels and drama, he appeared frequently on the amateur stage and in 1891 was put in charge of the Moscow Philharmonic school's drama department. With the late Stanislavsky, noted Russian actor and producer, he founded the Moscow Art theatre in 1898 in a move to lift the national theatre from its artificiality and stagnation. They introduced plays by the younger generation of Russian writers and brought a spirit of realism and vitality to the stage. The Moscow Art theatre achieved a world-wide reputation, toured the continent with great success and in 1926 made a 26-week road tour of the United States. His last production, *Last Days of Pushkin* by Bulgakov, had its première only two weeks before his death. He published *My Life in the Russian Theatre* (1936), and shortly before his death received a state premium for war services awarded him by Stalin. He died in Moscow, April 25.

Dartmouth College. An institution wholly undergraduate, for men, at Hanover, N.H. Civilian enrolment of 361 during the summer 1943 term was lowest since 1894. Normal enrolment was maintained, however, with assignment to Dartmouth of the largest navy V-12 unit in the U.S., totalling 2,000 navy and marine trainees in the Navy College Training program. The college provided all instruction, housing and messing for the unit. New freshmen trainees were received every four months. The majority of military students followed prescribed curricula for a total of four 16-week terms preparing for midshipmen's schools and commissions as deck officers, or marine officer training schools and commissions in the marine corps. Other trainees at Dartmouth were preparing for medical, engineering, supply and aviation commissions. President Hopkins announced that Dartmouth would continue to offer its liberal arts curriculum to all civilian students qualifying for admission even though this number became steadily smaller. For statistics of enrolment, faculty, endowment, library volumes, etc., *see* UNIVERSITIES AND COLLEGES. (S. C. HA.)

Darwin, Leonard (1850–1943), British economist and eugenist, fourth son of Charles Robert Darwin, was born Jan. 15. He attended Woolwich Royal Military academy, and was later instructor at the school of military engineering in Chatham, 1877–82. He served on the intelligence staff in the war office, 1885–90 and left the army in the latter year with the rank of major. In 1892 he became liberal unionist member of parliament for the Lichfield division of Staffordshire. He was president of the Royal Geographic society, 1908–11, and of the Eugenics Education society, 1911–28. He also held the post of chairman of the Bedford College for Women, University of London, 1913–20. He wrote several books on economics and eugenics, among which were *Bimetallism* (1898), *Municipal Trade* (1903) and *The Need for Eugenic Reform* (1926). He died in Sussex, March 21.

Dashwood, Mrs. Elizabeth M.: *see* DELAFIELD, E. M.

Daughters of the American Revolution, National Society of. The National Society of Daughters of the American Revolution was founded in 1890 for historical, educational and patriotic purposes. Membership: about 145,000 in 2,570 chapters. President general: Mrs. William H. Pouch. Headquarters: Administration Building, 1720 D St. N.W., Washington, D.C.

The society adopted as its principal war project the D.A.R. war project fund, resulting from voluntary contributions of $1 or more from members, to be used to further the blood plasma program and to purchase surgical and medical life-saving equipment. In Oct. 1943 this fund totalled $162,000, from which purchases have been made through the American Red Cross of 33 mobile blood donor units, 17 stationary blood donor centres, 8 station wagons, 2 Buick sedans and 1 truck. Over $33,000,000 in war bonds and stamps were subscribed by members and thousands of buddy bags were sent to members of the armed forces.

During 1943, gifts totalling $77,000 for 14 approved schools for foreign-born and southern mountaineers were approved. Regular activities included instruction in the right use of leisure and respect for rights of others to 235,000 children in 7,200 Junior American Citizens clubs, which in one Pennsylvania city invested $65,000 in war stamps; and distribution of 300,000 manuals for citizenship in 16 languages, to aid in naturalization. High school seniors from every state, winners of the Good Citizenship contest, were given a war bond in lieu of the regular award of a trip to Washington, since the society now holds its annual congresses outside of Washington city during the war period. About 53,900 copies of the *National Defense News* were distributed, as well as hundreds of thousands of Flag Codes and copies of other patriotic and educational literature. Through 118 clubs the society furthered its educational endeavours in

training girls in homemaking. A student loan fund is maintained to assist worthy young persons in the pursuit of education. (H. R. P.)

Davies, Joseph Edward (1876–), U.S. lawyer and diplomat, was born Nov. 29 in Watertown, Wis. He was graduated from the University of Wisconsin, 1898, and received his law degree from the same school in 1901. Admitted to the Wisconsin bar in the latter year, he practised law until 1913. During this period he also held office as state's attorney from 1902 to 1906. He was associated with the federal trade commission, 1914–18, and after an unsuccessful candidacy for the senate in 1918, he established a law practice in Washington. In 1936, President Roosevelt asked him to become U.S. ambassador to the soviet union. The assignment was accepted eagerly and on Nov. 16 became official. The next two years were spent in carrying out the famous "mission to Moscow." Davies was extremely popular with the Russians and was largely responsible for the excellent relationship that developed between the U.S. and the U.S.S.R. He left the soviet union in 1938 and was named ambassador to Belgium. He was recalled to Washington in Jan. 1940 to serve as a special assistant to Secretary of State Cordell Hull. After his return to the U.S., Davies emphasized the necessity for mutual confidence and the closest co-operation with the soviet union. In May 1943, he carried a personal message from President Roosevelt to Premier Stalin. In the light of subsequent events, it was surmised that Davies had laid the groundwork for the Moscow and Tehran conferences, held at the end of 1943. He wrote *Mission to Moscow* (1941), an "inside" story of Russia which was later made into a motion picture.

Davis, Chester Charles (1887–), U.S. government official, was born Nov. 17 near Linden, Dallas Co., Iowa. He was graduated with a bachelor's degree from Grinnell college, Iowa, 1911, and upon leaving school was associated with several journalistic enterprises in South Dakota and Montana. In 1921 he became commissioner of agriculture and labour for the state of Montana; four years later he was director of grain marketing for the Illinois Agricultural association, and he was associated with farm organizations from 1926 to 1928. From 1929 to 1933 he was engaged in the processing business. At this period of the economic depression, the new Roosevelt administration sought to alleviate the plight of the farmer through the medium of the Agricultural Adjustment administration. Davis was chosen administrator of the AAA in 1933 and continued in this capacity until 1936. He also served with the Export-Import Bank of Washington and the Commodity Credit corporation. From 1936 to 1943, Davis was affiliated with the federal reserve system, first as a member of the board of governors and later as president of the Federal Reserve Bank of St. Louis. In March 1943 President Roosevelt named Davis food administrator. Davis soon came into conflict with the OPA, however, and resigned on June 28. In accepting his resignation, President Roosevelt criticized Davis for failure to co-operate in the system of "co-ordinated controls."

Davis, Elmer (1890–), U.S. journalist, radio news analyst and government official, was born Jan. 13 in Aurora, Ind. A graduate of Franklin college, he was a Rhodes scholar at Queens college, Oxford university, completing his studies there in 1912. Davis was a reporter and editorial writer on the *New York Times*, 1914–24, wrote a dozen books, including essays, short stories and satires, and reached the top rung of radio fame in 1939 as a news analyst for the Columbia Broadcasting system. On June 13, 1942, President Roosevelt announced his decision to fuse the various overlapping government information services into a single centralized organization and appointed Davis to head the new organization, known as the OWI (Office of War Information, *q.v.*). Davis had the delicate task of co-ordinating the government's war publicity and propaganda, both at home and abroad. His work was complicated by army and navy censorship and by the reluctance of high officials to consult him before talking to the press. Under his direction OWI took a frank view of the war, consistently warning the American people that the conflict would be long and hard. During 1943 Davis and the OWI had a rough year. They were under constant attack. Late in the year there was much criticism from professional newspaper sources, when the British released news of the Cairo conference, and the Russians of the Tehran conference, before OWI permitted American papers to use it. On Sept. 18, the OWI reorganized its overseas activities, separating propaganda and information.

Deafness. The development of such drugs as the sulfonamides and penicillin was expected to have a great effect in reducing the total amount of deafness in the United States by the extent to which the use of these drugs in meningitis, scarlet fever and similar infections prevents the complications related to hearing. The deaf benefit greatly by the extension of funds to welfare agencies charged with instruction and care of the hard of hearing. Organizations such as the Federation of Organizations for the Hard of Hearing do a great deal to extend education in lip reading and in other techniques of communication.

Statistics assembled by Harry Best indicated something over 60,000 cases of deafness in the U.S. in 1940. He also provided a complete list of schools for the deaf in the U.S. The problem of the completely deaf is modified by partial loss of hearing coming with advanced years. Important studies were made dealing with the measurement of air and bone conduction in hearing and the changes that take place in the tissues with progressive hardness of hearing.

In 1,000 cases of otosclerosis, 50% began between the 16th and 30th year of age and 14% in those younger than 16. If fixed changes occurred in the hearing before adulthood, there was not much that could be done to increase hearing.

During 1943 there was continued progress with the fenestration or window operation for loss of hearing. Operative success occurs when the opening into the semicircular canal is not refilled by bony tissue. In 1943 it was said that two factors retarded the use of hearing aids—first, sensitiveness of patients in admitting deafness by wearing hearing aids and, second, their high cost. At the end of 1943 a new hearing aid was developed which could be purchased for $40, the purchase price including the service. The result of the introduction of this hearing aid was to bring about a lowering in cost of similar devices and a wide extension in the use of such hearing aids.

Stieglitz, ed., *Geriatric Medicine: Diagnosis and Management of Disease in the Aging and in the Aged* (1943). (M. Fi.)

Deaths (of prominent persons in 1943): *see* OBITUARIES.

Death Statistics. Judging from mortality reports, health conditions in the United States and Canada during 1943 were not as good as in 1942. England and Wales, on the other hand, had an improvement. Provisional reports for the United States covering the first nine months of 1943 showed

an increase of 4.9% in the death rate over the same period of 1942. The largest increases were reported in the New England, Middle Atlantic and Pacific Coast areas, while the increases were smallest in the states of the south. According to reports for the United States as a whole, there were 1,385,033 deaths during 1942, the death rate being 10.4 per 1,000 total population. Canadian cities and towns of 10,000 or more people had 6% more deaths during the first nine months of 1943 than during the corresponding period of 1942. Total deaths in Canada during 1942 numbered 112,864, with a death rate of 9.7 per 1,000 population. London and the great towns of England and Wales experienced 2.3% fewer deaths through the first nine months of 1943 than the same period of 1942. During 1942 as a whole, there were 480,131 deaths in England and Wales, with a corresponding death rate of 11.6 per 1,000 population. Civilian air-raid deaths in that country for the four-year period of war ending in Sept. 1943 totalled 49,130. Of this number, there were 23,265 up to the end of 1940; in 1941, there were 20,520 deaths, 3,235 in 1942, and 2,110 through September of 1943.

Official figures issued by the United States as of Nov. 11, 1943, reported a total of 121,319 casualties in the armed services. These were classified as follows: dead—army 12,841, navy, 12,883; wounded—army 30,263, navy 5,640; missing—army 23,954, navy 8,918; prisoners of war—army 22,592, navy 4,228. The 25,724 dead so far in this war may be compared with the 50,510 Americans killed or died of wounds in World War I, 1,704 in the Spanish-American War, 110,070 Union soldiers and 74,524 Confederates in the Civil War, 1,549 in the Mexican War, 1,956 in the War of 1812 and 4,044 in the Revolutionary War. American experience with fatalities from wounds in World War II seemed remarkably good, as compared with experiences in previous wars. Factors contributing to the improvement were the use of sulfa drugs, blood plasma, new anaesthetics, and also the efficient organization of the medical services of the armed forces at every stage from the field to the hospitals in the United States.

For the calendar year 1942, the death rates per 100,000 population for the ten leading causes were: diseases of the heart 295; cancer 122; intracranial lesions of vascular origin including cerebral haemorrhage 90; nephritis 72; influenza and pneumonia 56; tuberculosis 43; premature birth 26; diabetes mellitus 25; motor vehicle accidents 21; and syphilis 12.

The most detailed and current account of the trend of the death rates from the leading causes was available from the records of the many millions of industrial policyholders of the Metropolitan Life Insurance company. According to this experience for the first ten months of 1943, the death rates were appreciably higher than during the like period of 1942 for the following of the more important causes of death: whooping cough, diphtheria, influenza, pneumonia, cerebral haemorrhage, diseases of the coronary arteries, chronic heart diseases and war deaths by enemy action. Decreases in death rates were recorded for tuberculosis, syphilis, suicides, homicides, occupational accidents and motor vehicle accidents.

Beginning with 1943, the United States bureau of the census issued a monthly report on "Current Mortality Analysis" based on a study of a sample of death certificates received. This report was prepared principally in order that, during the war, health officers might watch the current trend of a number of diseases and thus note significant departures that might cause concern. A complete account of this innovation is given in *Vital Statistics—Special Reports*, vol. 17, no. 26, issued by the bureau of the census, June 18, 1943. The report for August indicated that poliomyelitis reached epidemic proportions that month. The report also noted a continuation of the unusually high death rate from cerebrospinal meningitis which first showed itself late in 1942; a prognostication is made that the rates would remain high through the spring of 1944. This high mortality, which is attributed, in part, to the crowded conditions of the population during the war, was previously noted as a wartime phenomenon, although many epidemics have been experienced in time of peace. Case fatality from cerebrospinal meningitis was radically reduced by the use of sulfa drugs.

Several interesting observations were made in a study of mortality according to marital status which compared the situation in 1929–31 with that in 1939–41. The data related to the population of New York state, exclusive of New York city. It is generally established that the death rates are lower for the married than for the single, much more so among men than among women. Widows and widowers generally have the highest death rates. During the decade under review, the death rates fell somewhat faster among the married than among the single under age 40. The result has been to add to the relative advantage of the married at these ages. Among men, the difference in trend between the single and the married was very slight. Among women, the improvement was much more rapid for the married, due in large measure to the marked decreases in mortality from the conditions associated with childbearing. At ages 40 and over, the decline in mortality was more rapid among the single, so that the difference in the death rates between the single and married at these ages was reduced. Mortality of widowers during the decade under review did not improve as rapidly as that of either married or single men; the situation among widows was not as clear.

It was estimated that at least three workers in the United States are killed in accidents while off their jobs for every two who are fatally hurt while on the job. This conclusion was based upon the records of white male industrial policyholders of the Metropolitan Life Insurance company who died in accidents during 1937–39. Among the occupations practically free from special hazards were clothing factory operatives, cotton and woollen mill operatives, store clerks and salesmen, office workers and printers. Fatal accidents of nonoccupational origin were relatively more frequent than those of occupational origin even in such vocations as machinists, farmers and farm labourers, mechanics, and iron and steel mill workers. Among the occupations in which fatalities from injuries suffered on the job were relatively more frequent than those off the job are electric light and power linemen, coal miners, structural iron workers and railroad trainmen.

Some idea of the differentials in longevity according to social class is provided in "Life Tables for Social Classes in England" by C. Tietze, published in the Milbank Fund *Quarterly*, April 1943. The data reflect conditions in 1931. The professional and allied classes had an average length of life of 63.1 years; skilled workers, 60.0 years; and unskilled workers, 55.7 years.

In 1943, the United States bureau of the census published life tables for urban and rural areas in various regions of the

Average Duration of Life in Years in the United States According to Place of Residence, Based on 1939 Mortality

Sex and Place of Residence	White Persons				Nonwhite Persons			
	All Areas	The North	The South	The West	All Areas	The North	The South	The West
Males								
Cities of 100,000 or more	61.6	62.1	59.7	60.7	51.0	51.8	48.9	58.4
Other urban places	61.4	62.9	57.0	61.3	46.9	52.8	45.2	52.2
Rural territory	64.1	64.7	64.0	62.5	55.2	49.3	55.9	48.3
Females								
Cities of 100,000 or more	66.3	66.4	65.7	66.2	54.6	55.3	53.0	62.4
Other urban places	66.2	66.8	63.4	67.9	51.1	56.1	49.6	56.9
Rural territory	67.5	67.7	67.5	67.0	57.2	50.7	57.9	48.9

country. The findings were based on mortality in 1939. The table on page 226 presents the figures for average length of life from this study. On the whole, longevity is greater in the rural territory than in urban places. The south generally made the poorest showing and the north the best.

For the United States as a whole, the average length of life corresponding to the mortality statistics for 1941 was 64.36 years. The figures according to colour and sex are: white males 63.39 years; white females 68.08 years; coloured males 53.48 years; and coloured females 56.77 years. Compared with 1900–02, these represent gains of 15.16 years for white males; 17.00 years for white females; 20.94 years for coloured males; and 21.73 years for coloured females. (*See* also ACCIDENTS; CENSUS, 1940; INFANT MORTALITY; SUICIDE STATISTICS.)

Decorations, Military and Naval.

During World War II it was announced by the United States that there had been created a legion of merit in four degrees, something new in the history of the United States decorations. There was also created the medal for merit, a decoration for award to civilians—again a departure from previous practices. Both of these decorations can be awarded to foreigners, in fact the grade of chief commander, commander and officer of the legion of merit may only be awarded to officers of foreign friendly nations. Presidential naval unit citations and army distinguished unit badges have been awarded to whole organizations for collective recognition of outstanding performance in the face of the enemy.

The air medal, a popular decoration in the air forces of the army and navy was completed during 1943. The navy, following the lead of the army, created the navy and marine corps medal for noncombat service, which is similar to the conditions of award of the army soldier's medal. The navy also adopted the use of the army's silver star and Purple Heart.

Silver oak leaf clusters were authorized by the army to represent five additional awards of any army decorations. The army, following the example of the navy, coast guard and marine corps created a good conduct medal to be known as the army good conduct medal.

The merchant marine distinguished service medal was authorized April 11, 1943, and is awarded by the U.S. maritime commission to any person in the merchant marine who on or after Sept. 3, 1939, distinguishes himself in the line of duty.

Merchant marine combat bar is issued to all crew members of merchant ships attacked. A crew member forced to abandon his vessel is awarded a silver star for attachment of the bar. American Typhus commission medal was authorized Dec. 24, 1942; the ribbon consists of a maroon background with a yellow central stripe—the medal had not been struck at the close of the year.

Army of Occupation of Germany medal (1918–23) was authorized Nov. 21, 1941, for those who served in Germany or Austria-Hungary from Nov. 12, 1918, to July 11, 1923, also to members of the naval service detached from ships for shore duty. This medal was to be issued after World War II.

The American defense service medal was authorized June 28, 1941—for those of the army who were outside the continental United States a clasp "Foreign Service," and those of the navy "Fleet" for service on high seas, and "Base" for service on shore outside continental United States will be issued.

There was also authorized a women's army corps medal for award to those women who were formerly in the women's army auxiliary corps and who re-enlisted in the WAC. This was the first time a medal was created exclusively for women.

CAPT. JOSEPH J. FOSS of the U.S. marines receiving the congressional medal of honour from President Roosevelt May 18, 1943, for shooting down 26 Japanese planes. With him are his mother (left) and wife

The world was divided into three parts for the award of World War II campaign medals—American campaign; European-African-Middle Eastern campaign; and Asiatic-Pacific campaign. Clasps were to be announced as the campaigns closed. The medals were to be furnished after the war but the ribbons were worn immediately.

Silver battle stars were authorized by the army to represent five battle engagements; previously bronze battle stars only were used.

Civilian government employees of the war department were given recognition on Dec. 8, 1943, when the initial awards of ribbons (no medals to accompany these awards) were made to those employees who had performed faithful service—civilian service; meritorious civilian service or exceptional civilian service.

There were numerous foreign decorations created but these awards would not be generally known until after World War II.

Defense Transportation, Office of.

The Office of Defense Transportation was created by executive order on Dec. 18, 1941, to "assure maximum utilization of the domestic transportation facilities of the nation for the successful prosecution of the war." Joseph B. Eastman, chairman of the Interstate Commerce commission, was appointed director of the agency.

During 1943 the Office of Defense Transportation continued to exercise supervisory powers over the various branches of domestic transportation under broad programs developed in 1942. Certain orders of the agency were revised to meet changed conditions, and new controls were established as need arose. While expanding war traffic exerted increasing pressure on all types of domestic transportation, no serious failures or interruptions of service occurred.

Steps were taken early in 1943 to avert threatened congestion of rail freight movement on the western transcontinental lines. The associate director of the Office of Defense Transportation's division of railway transport, in charge of the western region, was vested with Interstate Commerce commission powers to divert traffic from heavily burdened to less crowded routes. Similar arrangements subsequently were made for traffic diversion in the eastern and southern regions.

Deliveries of petroleum products transported to the east coast in solid trains of tank cars, operated under the supervision of the Office of Defense Transportation, reached a peak of over 1,000,000 barrels a day in July 1943. Shortages of various types of freight cars were experienced occasionally in certain regions, but the car-supply situation was kept generally under control by the heavier loading required under general orders ODT 1 and 18, by utilization of refrigerator cars for carriage of general freight in the direction of the normal empty movement, and by other measures to increase efficiency of operations.

Railroad passenger travel in 1943, including organized troop movements, rose more than 65% over the record total of the previous year. The increased traffic had to be handled by the carriers without any significant additions to the supply of passenger equipment. The Office of Defense Transportation helped to alleviate crowded travel conditions, and assure space on regular trains and on intercity buses for the large volume of furlough and essential civilian business traffic, by conducting a continuing campaign to curb unnecessary civilian travel.

Conservation measures in the fields of motor transport and local transport were intensified throughout the year. Many joint action plans for pooling use of truck, bus, or taxicab facilities were put into effect. Development of an acute gasoline shortage in the northeast in May 1943, caused the agency to order sharp emergency reductions in commercial motor vehicle mileage and restriction of all wholesale and retail deliveries in that region. While the order cutting bus and taxicab mileage was revoked in August, the restrictions on deliveries were extended to the whole country in October.

The Office of Defense Transportation in mid-June 1943, broadened its permit system for control of Great Lakes shipping. Late opening of the navigation season in 1943 made it impossible to match the high 1942 record for movement of iron ore down the Lakes, but the grain movement surpassed the total of the previous year.

After the beginning of 1943, the Office of Defense Transportation acted as claimant agency for domestic transportation under the Controlled Materials plan of the War Production board. The agency functioned also as claimant for gasoline and rubber for highway use. In May 1943, as the result of a labour dispute, the Office of Defense Transportation took over operation of the American Railroad of Puerto Rico. A regional office was established in Hawaii in the summer of 1943. (*See* also Electric Transportation; Motor Transportation; Railroads.)

De Gaulle, Charles: *see* Gaulle, Charles de.

De Geer, Gerard (Jakob),

Baron (1858–1943), Swedish geologist, was born Oct. 2. A professor of geology at Stockholm university, 1897–1924, he was also founder and head of the Geochronological institute in that city. From his study of various sediments in earth layers, he was able to calculate the duration of the different stages of prehistoric eras—a branch of geology known as geochronology—and was also able to compute a climatic calendar that embraces a 16,000-year period in world history. Though he devoted most of his research to Sweden's geological and geographical changes, he also made scientific investigations in Canada and the U.S. and found a similarity in soil cross sections of both continents. He was the author of numerous scientific works on glacial and postglacial phenomena and was a member of a score of learned societies. He died in Stockholm, July 23, according to an American-Swedish news agency report.

Delafield, E. M.

(Mrs. Elizabeth M. Dashwood) (1891–1943), British novelist who specialized in gentle and restrained satire of the English middle class and excelled in the employment of the psychoanalytic technique in baring the motives of her principal characters. Among her best known works are: *Challenge to Clarissa* (1931), *Diary of a Provincial Lady* (1931), *The Provincial Lady Goes Further* (1932), *The Provincial Lady in America* (1934), *Straws Without Bricks* (1937), *The Brontes* (1938), *The Provincial Lady in Wartime* (1940) and *No One Will Know,* a three-act comedy (1941). Mrs. Delafield, who worked with the British Ministry of National Service during World War I, also served as a speaker for the British Ministry of Information in World War II. She died Dec. 2 at her home in Cullompton, Devonshire, England.

Delaware.

Delaware, nicknamed the "Diamond state," is located on the middle Atlantic seaboard of the U.S.A. and was the first to ratify the federal constitution on Dec.

7, 1787. Area 2,057 sq.mi. (land, 1,978; inland water, 79). Pop. (1940), 266,505, of whom 139,432 were urban and 127,073 rural. Native white numbered 215,695; foreign, 14,913; Negro, 35,820. Estimated population for 1943 was 273,778, of whom 187,680 were in New Castle county. Capital, Dover (5,517). Wilmington is the only larger city (112,504 in 1940).

History.—Civilian defense activities in Delaware reached their peak during 1943 with the training of gas detection, plant protection and bomb reconnaissance personnel. Air spotter programs were later reduced from 24 hours a day to one day a week, and the closely enforced dim-out along the coast was eased. The factories of the state, especially in the Wilmington area, continued their high rate of production of war materials. The estimated increase of retail and wholesale business during 1943 was not more than 15%.

The state legislature met in session on Jan. 4, 1943, and continued until April 9. Outstanding legislation included the creation of a state guard, the conferring of emergency powers upon the governor, enactment of a building code for New Castle county, and the establishment of a State Soil Conservation commission. The governor in 1943 was Walter W. Bacon; secretary of state, William J. Storey; adjutant general, Paul R. Rinard; attorney general, Clair J. Killoran.

Education.—There were 165 elementary and 44 secondary schools in 1943 with a total enrolment of 42,641 pupils and a teaching staff of 1,679. Although the loss of teachers was great, no schools were closed and only some agricultural and manual training courses had to be omitted.

Public Welfare.—The public assistance costs for the fiscal year ending June 30, 1943 were $607,740.90. In July 1942 the total case load was 3,279, but by the end of the fiscal year 1943 it had experienced a 23% decrease to 2,533. During the same period, 15 welfare institutions had case loads of 8,274 at the beginning of the fiscal year and 7,651 when the year was finished. Statistics were not available for the number of inmates in each of the county prisons.

Communication.—In 1943 there were 3,939 miles of highways under state control. All new construction ceased because of the war, and the resources of the State Highway commission were devoted toward the maintenance of the existing highways. Highway expenditures during 1943 were $2,594,961.90 as compared with $4,088,515.85 for the previous year. The Federal Aid expenditure in 1943 was $191,662.89 as compared with $708,532.52 for the foregoing year. Railroad mileage (1938) 297. The waterborne commerce for 11 months of 1943 was 153,938 tons. The 10 airfields of the state were either under the control of the army or closed to civilian traffic. There were approximately 70,000 telephones as of Oct. 31, 1943.

Banking and Finance.—There were, in 1943, 30 state banks with resources of $413,278,677.77 and deposits of $357,855,263.90. The 13 national banks had resources of $28,107,837.88 and deposits of $23,254,597.07. The resources of the 42 building and loan associations were $14,595,983.23. The state budget (fiscal year 1942–1943) was $10,967,338.14, the receipts $12,139,712.63, and the expenditures $10,111,194.22. The state's gross debt was $4,943,300 and the net debt was $4,867,845.41.

Agriculture.—The total value of agricultural production in 1943 (Jan.–Sept.) was $63,612,000. The cash income from crops was $11,016,000 and from livestock $52,596,000. A serious drought reduced the crop yields to a low level for most crops, except those harvested before the drought began on June 13.

Manufacturing.—The estimated total value of manufactures as of Nov. 1, 1943 was $171,299,798.05.

Table I.—Leading Agricultural Products of Delaware, 1943 and 1942

Crop	1943	1942
Corn, bu.	3,226,000	4,092,000
Apples, bu.	499,000	940,000
Hay, tons	95,000	92,000
Wheat, bu.	1,008,000	1,380,000
Tomatoes, tons	5,500,000	5,500,000
Strawberries, crates	69,000	110,000
Lima beans, tons	5,700,000	8,910,000

Table II.—Principal Industries of Delaware, 1943 and 1942

Industry	Value of Products	
	1943	1942
Chemicals	$22,333,203.62	$17,627,502.30
Shipbuilding	57,213,700.04	17,652,483.42
Foundries, machine shops, tools	35,454,394.14	38,750,988.04
Leather	8,510,131.61	7,409,668.74
Fibre	2,988,317.81	16,362,262.83
Textiles	35,070,462.60	15,641,112.39
Canning and packing	9,216,774.15	2,842,834.80

Mineral Production.—The chief products, granite, building stone, brick and clay products, had a total value of $172,277.96 (Nov. 1, 1943). The decrease from $325,673.19 for the same period of the previous year was largely due to the curtailment of building.

BIBLIOGRAPHY.—C. A. Weslager, *Delaware's Forgotten Folks* (1943); Gilbert Byron, *Delaware Poems* (1943); *Delaware Cases 1792–1830*, edited by Daniel J. Boorstin, (1943). (L. D. V.)

De Marigny, Alfred: *see* OAKES, SIR HARRY.

Democracy is not only a technique of government, based upon freely elected representative institutions, and upon an executive responsible to the people; it is based upon the belief of the equality of all individuals and of the equal right of all to life, liberty (including the liberty of thought and expression) and the pursuit of happiness. The denial of this equality and of individual liberty, the proclamation of authoritarianism and of the inequality of men and races as a "new order," is characteristic of fascism, which arose as a conscious and aggressive world-wide opponent of democracy.

The year 1943 saw democracy for the first time in many years again on the offensive, not only holding its own, but also beginning to defeat fascism. The advance of democracy was twofold, in the field of war strategy and in the field of ideology. In the war the tide turned definitely against the fascist aggressors. In 1940 German aggression against France and in 1941 against soviet Russia, as well as Japanese aggression against America at the beginning of 1942 had convinced many of the inferiority of democracy in the field of war and industrial mobilization: the splendid achievements of British and American industry and war strategy in 1943 proved that within a short time democracy did mobilize better than fascism could in many years of preparation and of totalitarian organization. These successes of democracy in proving its superior efficiency brought also in the ideological field a reassertion of the faith in democracy. The ignominious collapse of Mussolini, the father of fascism, and of fascist Italy in the summer of 1943 convinced many that fascism did not strengthen nations but undermined their moral fibre.

In the democratic countries the democratic liberties were everywhere maintained in spite of the war and, in many fields, even broadened. The anti-democratic movements in the United States and in Great Britain were discredited and weakened. In the western hemisphere only Argentina adopted during 1943 a strictly anti-democratic trend, yet even there the majority of the population opposed the pro-fascist policy of the authoritarian government.

The few neutral countries of Europe reflected in 1943 the growing faith in the victory of democracy. In spite of the strong German pressure the Danish people, under German occupation, gave a smashing demonstration for democracy in their parlia-

mentary elections in March 1943. More than 90% of the electorate voted, and the five democratic parties polled 362,000 more votes than in the elections of 1939. The greatest gain was shown by the Social Democrats, the strongest single party, and by the violently anti-nazi conservative party whose political leader was in Great Britain leading the fight against Germany. The two non-democratic parties, the Danish nazis and the Farmers' party, received together only 68,000 votes out of a total of almost 2,000,000. Thus the elections became a heavy blow to the prestige of German fascism and forced the Germans to take over the administration in Denmark.

A similar success for democracy was achieved in Switzerland where the elections in the fall of 1943 brought a great gain to the Social Democrats who for the first time became the strongest political party in the National council having almost 25% more seats than in 1939. The two leading fascist organizations in Switzerland, the Nationale Gemeinschaft and the Rassemblement Federal, were dissolved in July 1943 and their newspapers suppressed.

Of even greater importance as an indication of a swelling world-trend in favour of democracy were the elections held in July 1943 in the Union of South Africa. The democratic parties, which had supported the war from the beginning, received under the leadership of Field Marshal Jan Christiaan Smuts 107 seats while the pro-fascist opposition, which had opposed South Africa's participation in the war, received only 43 seats. While the democratic and pro-war parties had had in the last parliament a majority of only 18, they gained in 1943 a majority of 64. All cabinet ministers were re-elected, some with record majorities The number of voters was unusually large. (*See* also COMMUNISM; EDUCATION; FASCISM; GREAT BRITAIN; UNION OF SOVIET SOCIALIST REPUBLICS; UNITED STATES.)

BIBLIOGRAPHY.—Basil Mathews, *United We Stand* (1943), Ernest Jackh, *The War for Man's Soul* (1943). (H. KO.)

Democratic Party. The Democrats retained control of both the house of representatives and the senate through 1943, but their majority was so slight that they suffered many reverses on the domestic front. Teaming with the Republicans, conservative members of the dominant party staged numerous rebellions against the congressional leadership and the administration.

Capitol hill recalcitrancy became more marked as the result of a July-August recess spent among the home folks. Constituents criticized chiefly the "bureaucrats," especially the Office of Price Administration, the administration's alleged coddling of labour and huge expenditures of money. It was this accumulation of complaints which inspired an unprecedented display of bipartisan bitterness toward the executive branch.

As the year ended, 40 or 50 Democrats, principally southerners, were voting with the Republicans on many controversial domestic policies. With the majority having only a few more seats than the opposition—219 to 208 in the house and 58 to 37 in the senate—the Democrats were fortunate that they did not receive more rebuffs. The Republicans, however, exercised unusual restraint in many instances lest they be accused of hampering the war effort.

Almost every major measure considered or enacted into law concerned the war effort and domestic problems arising from the conflict.

Appropriations voted by the first session of the 78th congress totalled $114,500,000,000, and of this amount only $11,000,000,000 was allocated for financing the civilian establishments and the public debt. The balance was for war purposes. This sum brought the amount of money voted for military or naval or associated activities since July of 1940 to approximately $350,000,000,000.

The lend-lease act was extended for another year, or until March 11, 1944, and an additional $6,273,629,000 was set aside for this account. Since the original passage of the measure on March 11, 1941, lend-lease money and departmental sums made available to the Allies amounted to $60,653,629,000 by the end of 1943.

These extraordinary financial demands necessitated raising the debt limit from $125,000,000,000 to $210,000,000,000, which was voted without opposition.

Two new revenue acts were passed during 1943. The first one, which became law on June 9, 1943, provided for a modified pay-as-you-go plan under which partial collections are withheld at the source by the employer. In the second taxation program submitted in September, the treasury asked for an additional $10,500,000,000 in new levies, but the house responded with only $2,140,000,000. The senate increased the amount to $2,275,000,000, but the measure had not been acted on by that body when congress adjourned on Dec. 23, 1943.

Robert L. Doughton, chairman of the house Ways and Means committee, estimated that these two measures would raise an additional $43,000,000,000 in a full year of operation, as against federal receipts of only $5,700,000,000 from all sources in the prewar year of 1939.

The authority to negotiate reciprocal trade agreements was extended for two years, or until June 12, 1945. The administration had asked for a three-year renewal. Only a personal appeal by Cordell Hull, secretary of state, prevented the congress from scrapping this legislation on the theory that economic disturbances caused by the war had outmoded it.

Sporadic strikes, and especially a walkout by 600,000 United Mine Workers in the spring, led to passage of the Connally Anti-strike bill, as it is generally known. This empowers the government to take over and operate any kind of property where production of articles necessary to the war effort is impeded by strikes or other causes.

Differences over methods for preventing inflation precipitated the most serious struggles between the congress and the White House Under pressure from their constituents, the legislators rebelled against executive controls on prices and wages

In July the president vetoed a measure continuing the Commodity Credit corporation, which finances subsidy payments designed to keep down the cost of living, on the ground that it was "inflationary." In October Mr. Roosevelt asked again for renewal of this agency's life and for further power to use federal funds to check price rises by supporting farm income levels.

Congress, however, rejected the subsidy scheme. It voted to extend the CCC to June 30, 1945, but it prohibited the use of consumer subsidies after Dec. 31, 1943

Soldiers' legislation provoked extended debate. A proposal to set up a federal commission to supervise armed service balloting in the national elections was defeated by a coalition of "states rights" southern Democrats, who contended that the scheme invaded the 48 commonwealths' prerogatives, and Republicans. A bill providing for the draft of pre-Pearl Harbor fathers was amended so as to place the benedicts at the bottom of all selective service lists.

The Democratic leadership of congress remained unchanged during 1943. Vice President Henry A. Wallace of Iowa presided over the senate, and Senator Alben W. Barkley of Kentucky served as majority leader. Sam Rayburn of Texas held office as speaker, and Representative John W. McCormack of Massachusetts as house floor leader

Edward J. Flynn of New York resigned as Democratic national chairman in January of 1943. He was subsequently appointed

minister to Australia, but he asked the president to withdraw his name when it appeared that he could not be confirmed by the senate.

Postmaster General Frank C. Walker of Pennsylvania supplanted Mr. Flynn as national chairman. Representative Patrick Henry Drewry of Virginia continued as chairman of the Democratic Congressional committee, and Senator Joseph F. Guffey of Pennsylvania as head of the Democratic Senatorial committee. (*See* also UNITED STATES.) (R. TU.)

Denmark. A monarchy of north central Europe. Area, 16,575 sq.mi.; pop. (est. 1940) 3,844,312. Capital: Copenhagen (890,130). Other principal cities: Aarhus (99,881); Odense (85,521); Aalborg (55,652). Religion: Lutheran Christian. Ruler in 1943: King Christian X (*q.v.*); prime minister: Erik Scavenius, Nov. 8, 1942 to Aug. 29, 1943, after which there was no government except the illegal regime of the occupying Germans; Dr. Werner Best was "minister" and General Hermann von Hanneken military commander.

History.—Before the end of 1942 it was amply clear that the nazis had failed utterly to win over the Danes, their neighbours and their "racial brethren," or to make of Denmark the model collaborationist community which they had promised the world. The Danish army at last had to give up 100,000 rifles to the Germans, but its 3,000 horses were kept for farm work. The mounting encroachments against Danish sovereignty led to mounting resistance.

The underground press continued to flourish, despite the elimination by the gestapo of all but one of the staff of the largest paper, *De Frie Danske*. The number of police was approximately tripled. Parachutes brought powerful explosives from planes prepared in England. "Para-Danes" committed well-planned acts of destruction and trained thousands in the art of sabotage. The power station at the Recoil-Rifel syndicate's plant in Copenhagen was blown up; a building made over into a hospital for the nazis was burned down just after 500 new beds had been installed; locomotives exploded; bridges were blown up; tracks were torn up; switch towers were ruined; roads were mined; metal and machine shops were destroyed by bombs; shipyards were swept by fire; tunnels to Jutland were dynamited.

In Jan. 1943 the Germans announced that the Danish elections scheduled for March 23 could not be held; then for some reason they changed their minds, and two weeks prior to the date set the elections were permitted. The largest parties quickly combined in common newspaper advertisements appealing to the citizens to vote for any one of them as an expression of their Danism and their democracy. The coalition parties polled 363,000 more votes than in 1939. "Dansk Samling," which had only 8,553 votes in 1939, was not in the coalition, and stood for direct protest against German occupation; this party increased its vote fivefold to 43,257. The Danish nazis polled only 43,277 votes against the combined total of 2,009,295 who spoke out for Denmark versus Germany. The claims of democratic Danes that 98% of the people were with them were spectacularly confirmed.

This evidence of unity among themselves, coupled with the successes of the Russians and the Allied armies in Italy, led to increased sabotage and an inevitable German crackdown. The occasion came with the Swedish restrictions on German traffic and transit through Sweden to Norway (Aug. 15 and 20). This heightened the importance of routes through Denmark, and made more serious the general strikes at Esbjerg and Aalborg. An aluminum plant was wrecked, "unpopular persons" were thrown into canals, and a clash between Danish and German soldiers led to a declaration of "state of emergency" on Fyn (Aug. 20). Premier Scavenius tried to resign, and the nazis demanded that

GERMAN TROOPS chasing Danish patriots in Axeltory square, Copenhagen, during the anti-nazi uprisings in Aug. 1943

the death penalty be decreed for sabotage. Rapidly disturbances spread until strikes and riots tied up nine cities. The king broadcast an appeal for cessation of violence, but refused the German request to declare martial law.

The crescendo of German impatience and Danish wrath rose to its finale on Aug. 28, 1943. In the early morning of Aug. 29 the Germans took the final step, and the irretrievable break was made. Scavenius and his cabinet were out, the king was taken a prisoner to Sorgenfri ("Without-Care") Castle; and the German army was sole master in Denmark. Many labour leaders, editors, professors and army officers were arrested.

Vice Admiral H. A. Vedel rose early in the morning to get to Naval Headquarters, and sent a message to the fleet: "Now or never. Proceed to Sweden or scuttle the ships." Nine small warships raced successfully to the Swedish shore; one light cruiser, the *Niels Juel,* was sunk by German torpedo planes in the attempt; 45 other vessels were blown up in harbour, along with ammunition dumps and harbour installations. The king pledged that he would not authorize any new Danish government while Germans remained in Denmark. (Frits Clausen had disappeared in disgrace, having reportedly embezzled funds.) In Denmark government was suspended.

Repeatedly the nazis had demanded the application in Denmark of the Nuremberg laws against the Jews. The king had said that if the yellow "J" was required in Denmark he would wear one himself. In Sept. 1943 Curt Daluege, right hand man to the late "Hangman" Heydrich, came to Denmark and on Sept. 30 a general search for Jews began, synagogues were burned and arrests were made. About 1,100 were taken to a camp at Maria Theresien Stadt in Czechoslovakia; 143 communists were sent to Stutthof, near Danzig. But Sweden protested and offered asylum, and some 8,000 Danes fled across the sound (of whom about 5,000 were Jews).

German demands for forced labour continued, 35,000 men being called for in November. This number was reportedly reduced later to 7,000. Fines for violence were levied on Odense (1,000,000 kroner) and on Copenhagen (5,000,000 kroner). Farms and houses were requisitioned for bombed-out German families. Food and other supplies were taken at an increasing rate, and goods (such as coal) in return amounted to only about one-fifth of the "exports." The National bank showed a German debt to Denmark of about 3,500,000,000 kroner—a figure about six times the total revenue of the Danish state in 1937–38.

Denmark was a potential landing point in 1943 for a continental invasion, hence the Germans busied themselves with

defense works—guns, mines, fortifications, airfields, tank traps. General von Hanneken moved his headquarters from Copenhagen to Silkeborg, then to Holsted, and Minister Best was reported likewise to have moved with all his property to Jutland. Troops were increased to 10–15 divisions.

Education.—In 1940 there were 407,355 students in the elementary schools and 67,064 in the middle and secondary schools. In the two Danish universities 6,474 students were enrolled.

Economic and Financial Conditions.—Denmark, a rich agricultural country, was not starving in 1943. Lack of fodder and slaughter of livestock, however, were beginning to show serious effects. Coal was unobtainable in needed quantity from Germany, and 40,000–50,000 men were put to work cutting peat. Sabotage threw thousands of workers out of normal employment and destroyed productive establishments. (F. D. S.)

Dennis, Charles Henry (1860–1943), U.S. newspaper editor, was born Feb. 8 on a farm near Decatur, Ill. After graduating from the University of Illinois in 1881, he worked on a local paper, the Champaign *County Gazette*. Subsequently he went to Chicago, where he was hired by Victor Lawson in 1882 as reporter on the Chicago *Daily News*, then an enterprising six-year-old newspaper. He worked for the paper 61 years, rising from reporter to editor, 1925–34. He retired in the latter year as editor emeritus but continued to write a feature column on the editorial page. He was the author of *Eugene Field's Creative Years* (1924) and *Victor Lawson* (1935). Dennis died in Evanston, Ill., Sept. 25.

Dentistry. Schour and Sarnat described some of the oral manifestations of occupational origin. These manifestations, which are reactions to noxious agents, chemical, physical or bacterial, take one or more of the following forms —abrasion, decalcification of the teeth, inflammation and circulatory disturbances of the mucous membranes. Of particular interest was the observation that munition workers exposed to acids often show decalcification of the teeth; metal workers develop enamel pigmentations. Gingival haemorrhage and ulceration and necrosis of the mandible were reported among those exposed to benzine, such as coke-oven and smokeless-powder workers. These developments naturally stimulated employers of labour to develop dental programs and dental care in their plants.

Thomas, in a paper on "Mouth Infection in Industrial Workers" pointed out the importance of maintaining oral health as a means of preventing enormous loss of man hours and of increasing production. Hooper, dental consultant for the Chicago, Milwaukee, St. Paul and Pacific railroad, stated in a paper on "Dental Services in Industry," that, "No student of the problem of employee absenteeism resulting from non-occupational illnesses, can come to any other conclusion than that oral sepsis is a major, if not the major, underlying 'root' cause of an astonishing proportion of it. The industrial executive . . . the president, or the operating vice-president must consider what oral antisepsis, insisted upon and maintained among his employees, would mean in more production. If he will give this the same kind of businesslike analysis that he gives his other production problems, there will be a great and sudden increase in the number of dental clinics set up in industry."

A recognition of the importance of these conditions resulted in the council on dental health of the American Dental association making a study of the problems of industrial workers. In fact, industries developed dental service with the employment of dentists in their plants, so that an organization of industrial dentists was formed during 1943.

The problem of loss of manpower in the war services through dental disease, was of equal importance with loss of manpower in industry, and the dental corps of the army had a large expansion during 1943, to take care of the dental conditions of the armed forces. A completely healthy dental apparatus, from every point of view, is of especial importance, it was found, among men in the Aviation corps. Flight surgeons studied this problem carefully. Joseph and his colleagues pointed out that of the men exposed to simulated altitude runs in low pressure chambers, 1.2% experienced toothache. The pain was due to (1) reaction of vital pulps of carious teeth to lowered atmospheric pressure; (2) reaction of degenerated pulps to lowered pressure; (3) the presence of inlays with residual air spaces beneath them. Expansion of the air trapped beneath the inlay may cause pain or expulsion of the filling. The histologic structures allow little compensation for changes in circulatory or gaseous volume within the confined area of the pulp chamber, root canal or apical alveolar structure; therefore, pathological conditions may become apparent in the low pressure chamber.

War accidents to face and jaws stimulated the study of methods to improve the treatment of fractured jaws. The method most commonly used in fracture of the lower jaw was the wiring of the teeth of the lower jaw to those of the upper, using the upper teeth as a splint. This made it impossible for the patient to open the jaw or to eat solids during the period of bone repair, and patients had to live on fluids. A new method of "skeletal fixation," which made possible the use of the jaw while the fracture was healing, had a remarkable development in use and popularity during 1943. Winter reviews 50 cases of the use of the Roger Anderson skeletal fixation appliance in mandibular fracture. Pins are inserted in the bone on either side of the fracture, the fragments are brought in proper alignment and the clamps attached to the pins are tightened on a connecting rod which holds the fractured fragments firmly in position. The advantages of this appliance were its ease of application, complete functioning of the mandible, minimum of nursing care, and no feeding problem. Similar types of appliances are in use, and many articles appeared in the literature during 1943 describing the results of this type of treatment, most of which were favourable.

Dental caries is a hardy perennial, and every year many articles are devoted to this subject. Fluorine as a protective against dental caries continued to attract the centre of attention. The low incidence of dental caries among persons living in areas supplied by waters containing fluorides, was reported from many sections of the world. Dean reported that less than 0.5 parts per million of fluorine in drinking water brings high caries experience, while in 0.5 parts per million of fluorine or more, there is low caries experience. The addition of fluorine to drinking water supplies as a mass means of controlling dental caries is alluring. Dean commented that, "Viewing the domestic water problem in this light, one might with justification expect that the community's public water supply is destined to play an important role in communal dental health."

Dermatology. Interest in tropical medicine stimulated a symposium on tropical diseases of the skin. The following subjects were included: "Tropical Mycoses" by L. McCarthy; "Medical Entomology in Relation to Tropical Dermatoses" by M. E. Obermayer; "Yaws, Cutaneous Leishmaniasis and Pinta" by H. Fox; "Tropical Lymphangitis and Abscesses" by A. W. Grace; and "Leprosy" by C. N. Frazier.

Dermatitis due to contact with the manzanillo tree (beach apple) was reported by Satulsky and Wirts in a detachment of soldiers on the Canal Zone. Sixty men were affected, half of whom had temporary blindness from conjunctivitis and oedema of the eyelids. The cutaneous eruption was erythematous, often with vesicles or even large bullae. All recovered without sequelae in a week.

Under the title of "Dhobie Mark Dermatitis," Livingood, Rogers and Fitz-Hugh reported 52 cases in one military organization of an eruption due to marking clothes by native "dhobies" (laundrymen). The eruption varied from a mild erythematous to a bullous one, and was caused by the juice of nuts of a native tree. The authors thought it unlikely that fungous infections of the skin were due to laundering by dhobies.

Two cases of Calabar swelling (filariasis due to Loa Loa) were reported by Guy, Cohen and Jacob. The patients were missionaries returned from the French Cameroons in West Central Africa. Microfilariae were demonstrated in the blood and two adult worms were removed under local anaesthesia from the palpebral conjunctiva.

The histamine test was performed by Pardo-Castello and Tiant in approximately 300 cases of leprosy. It was reliable in delimiting areas of anaesthesia, particularly in maculo-anaesthetic lesions of the tuberculoid and nonspecific types. A reaction on normal skin consisted of a wheal with a surrounding erythema. In anaesthetic areas of leprosy, the erythema was always absent. The test was of no value in Negroes.

Among 20,000 men examined for induction into the army, Bereston and Ceccolini found 27 cutaneous entities, comprising 733 cases of dermatoses or syphilis. The commonest diseases of the skin in the order of frequency were acne vulgaris, psoriasis, pyoderma, tinea, varicose eczema, disseminated neurodermatitis, lipoma, sebaceous cyst, seborrhoeic dermatitis and nevus flammeus. Generalized psoriasis was the commonest cause of rejection, with disseminated neurodermatitis second, and neurofibromatosis third.

In view of the extensive use of sulfonamide drugs locally as well as internally, attention was called to the possible danger of sensitization by topical applications by Shaffer, Lentz and McGuire. Cohen, Thomas and Kalisch thought that sulfathiazole was potentially too dangerous a drug to use indiscriminately in mild ointments and that its intermittent use might produce dangerous reactions. Weiner considered that the incidence of sensitivity was low. Following the report by Bloom of two severe cutaneous reactions (one fatal) to sulfonamides, the section on dermatology at the annual meeting of the New York State Medical society voted unanimously to condemn the indiscriminate use of sulfonamides for relatively harmless diseases of the skin, and also the use of prepared dressings containing sulfonamide drugs, which are sold promiscuously to the laity.

Schwartz reported an outbreak of "cable rash" among electricians who were installing heat and flame proof cables in ships. The eruption which he had first described in 1935, was due to constant handling of cables in which halowax was flaked off upon the skin. The eruption occurred on the exposed parts, chiefly the face, and consisted of pinhead to pea-sized, straw-coloured cysts, due to plugging of the pilosebaceous follicles.

The histochemistry of lesions of pemphigus with special reference to bullous formation was studied by MacCardle, Baumberger and Herold. They concluded that hydrostatic pressure was not the prime factor in forming the bullae; that cohesion in pemphigus was good in spite of the Nikolsky sign; that polarographic studies showed no changes in bullous fluid as compared with normal serums. They found that the entire skin in pemphigus vulgaris contained increased amounts of silicon, iron, manganese and selenium.

What was apparently the first epidemic of erythema infectiosum in New York city was described by Chargin, Sobel and Goldstein. It affected 80 of 137 children in an orphanage. The incubation period varied from 1 to 12 days. The characteristic erythema of the cheeks was associated with mild constitutional symptoms and followed by frequent relapses, but no sequelae. Laboratory and epidemiologic studies failed to give any clue as to the causation.

Swartz and Lever treated 13 patients with dermatitis herpetiformis during the past two and one-half years with various sulfonamide compounds. Sulfapyridine controlled the eruption only as long as the drug was administered. Sulfanilamide was less effective even in larger doses. Sulfathiazole was of little value, while sulfaguanidine and sulfadiazine had no effect. No damage to the haemopoietic system was observed in any case. (*See* also MEDICINE.)

Destroyers: *see* NAVIES OF THE WORLD.

Detroit. Fourth largest city of the U.S.A., Detroit is the centre of the large industrial area of southeastern Michigan. Area, 137.9 sq.mi.; pop. (1940) 1,623,452; estimated (Dec. 1, 1943), 1,875,000. Foreign-born white, 320,664, of whom 110,698 were British and Canadian; 52,235 Polish, ranking second. Assessed value as of July 1, 1943, $2,794,425,810; gross bonded debt as of Dec. 31, 1942, $347,022,739, which included $91,788,739 of utility debt; net debt, $246,308,889 excluding all utilities; gross city appropriation, fiscal year ending June 30, 1944, $182,989,931 including utilities; tax levy, city and school purposes, $78,319,372; combined tax rate $28.03. Mayor, Jan. 1, 1944: Edward J. Jeffries, Jr.

The outstanding event of 1943 in the civic life of Detroit was the race riot of June 19 and 20. The affair had its roots in the large increase in Negro population (from 40,858 in 1920 to 149,119 in 1940 with later increases) and the resulting housing congestion, discrimination in certain war plants, unsatisfactory social conditions, and resentment on the part of some whites at the taking over of public recreation facilities by Negroes. The immediate cost was the loss of 34 lives, 1,000 persons injured, and $2,000,000 in property destroyed, with incidental financial losses due to absenteeism and extra-governmental costs (*see* RACE RIOTS).

There was the usual political aftermath to this unfortunate

affair. Mayor Edward J. Jeffries and his administration were accused by some whites of coddling the Negroes and of laxity in police activity. The Negroes in turn charged the police with unnecessary harshness and the administration with neglect and discrimination. In consequence, the Negroes joined with organized labour (both C.I.O. and A.F. of L.), and the Democratic organization in an effort to elect a "labour" ticket.

As a city whose industrial life depended originally on the automobile and then upon arms production, the problem of transition from war back to peace had much official and civic attention in 1943. The city government proposed to cope with the possibly resulting unemployment situation by extensive public works for which detailed plans were being drafted. To meet the costs, an appropriation of $6,000,000 a year was being accumulated. Effort was also made to supplement this fund by heavy taxes on the gross income of certain privately owned utilities, a tax on racing and much increased state-aid.

The graft inquiry begun in 1941 was brought to final and successful conclusion with the denial of appeals to some of the more prominent accused. In addition to numerous police officials, a prosecutor and sheriff were incarcerated. (L. D. U.)

Devers, Jacob L. (1887–), U.S. army officer, was born Sept. 8 in York, Pa. On his graduation from West Point in 1909 he was commissioned a second lieutenant in the field artillery. During World War I he served at Fort Sill, Okla., first as an artillery instructor and later as executive officer. He later spent five years as instructor of military tactics at the U.S. Military academy. As a division commander under Maj. Gen. Adna R. Chaffee, who built up the armoured force, he became experienced in the problems of mechanization, and in 1939 he was sent to Panamá as chief of staff in charge of mechanization of the Panama canal defenses. The next year he was recalled to direct the construction of Ft. Bragg. On Gen. Chaffee's resignation in 1941, Gen. Devers was appointed to fill his post as commander of the armoured force at Ft. Knox, Ky., and in Sept. 1942 he was advanced to the rank of lieutenant general. He remained at Ft. Bragg until May 1943, when he was named to succeed Lieut. Gen. Frank M. Andrews, killed in a plane crash, as commander of U.S. forces in the European war theatre. On Dec. 28, President Roosevelt announced the appointment of Gen. Devers as deputy commander in the Mediterranean theatre under Gen. Sir Henry Maitland Wilson.

Diabetes. A discovery which eventually might lead to the heart of the diabetic problem occurred in 1943 when J. S. Dunn, H. L. Sheehan and N. G. B. McLetchie produced necrosis or destruction in the islands of Langerhans of a rabbit's pancreas with alloxan.

The pancreas has been known to be the seat of diabetes since its removal by Joseph von Mering and Oscar Minkowski in 1889 was followed by that disease. Twelve years later E. L. Opie and L. W. Ssobolew localized the carbohydrate controlling function in groups of cells, constituting a 20th of the gland by weight, named the islands of Langerhans and from which in 1921 Frederick G. Banting and C. H. Best extracted insulin. Later in 1937 the experimental production of diabetes by repeated injections of anterior pituitary extract by F. G. Young was accompanied by the degeneration of the islands. When Dunn *et al.* injected alloxan into rabbits intravenously in the strength of 200 milligrams per kilogram weight, the animals died in 14 to 48 hours and save for slight involvement of other organs, the only pathological lesion found was a selective necrosis of the islands of Langerhans. The rabbits at first exhibited a temporary rise of blood sugar and then a fall to low levels of sugar such as is observed after an overdose of insulin. Arguing that since the islands were destroyed, if the animals could be kept alive during the hypoglycaemic phase, they should eventually develop diabetes, C. C. Bailey and O. T. Bailey protected and revived the rabbits with intravenous injections of 50% glucose and were rewarded by the appearance of hyperglycaemia, glycosuria and full-fledged diabetes the next day. J. S. Dunn and co-workers in Glasgow, C. C. and O. T. Bailey in Boston, and M. G. Goldner and G. Gomori in Chicago confirmed and extended the original experiments with rats and dogs thus establishing a third method whereby diabetes can be produced, the first by means of a chemical.

Alloxan at the close of 1943 had not been recognized in pure form in the body, but its structure is such that it is easy to believe it might play a significant role in man's daily metabolism. It is the ureide of mesoxalic acid and a powerful oxidizing agent. It can be produced by the oxidation of uric acid, the end product of purine metabolism in man. A satisfactory test for alloxan in body fluids had not been devised by the close of the year.

The diabetes of the alloxan rabbit or rat extraordinarily resembles that of the human subject. One of the Baileys' rabbits weighing 1,520 grams showed polydipsia and polyuria with water intake ranging between 350 and 700 cc., and urinary output between 160 and 470 cc. daily. The blood sugar rose to 640 milligrams per 100 cc. and in another rabbit not given insulin the blood sugar reached 700 milligrams, the lipaemia 8,412 milligrams and total acetone bodies expressed as acetone 144 milligrams per 100 cc. In a rat typical symptoms of diabetic coma, including Kussmaul respiration, developed. That rat died, but another with similar acidosis recovered with insulin. All five rabbits with alloxan diabetes under observation for two and a half months to five months developed cataracts and cataracts were also seen in an alloxan rat. Transitory diabetes was brought on when repeated small doses of alloxan, not less than 40 milligrams per kilogram body weight, were injected instead of the customary 200 milligrams per kilogram.

The ease with which alloxan diabetes can be produced in rabbits and rats and its close similarity to that in man furnish opportunities for the study of the disease and its complications both with and without treatment under conditions not hitherto so easily available and also the possibility of penetrating further than before into the causation of the disease.

The average duration of life of a diabetic at the beginning of the 20th century was 4.9 years, but by 1938–40 had reached 14.1 years. Based upon life expectancy as calculated by the Metropolitan Life Insurance company for one large clinic, the expectancy for different age groups approximated two-thirds of the corresponding population as a whole. This period of duration is far too short.

Diabetic coma caused two-thirds of all diabetic deaths in large diabetic clinics both in Germany and the U.S. up to 1914. Treatment was hopeless. From then until 1922 the rate fell to 40% among the clientele of one large clinic as a result of J. G. Allen's introduction of undernutrition and the better education of the patient. Insulin lowered the mortality still more rapidly and between 1922 and 1925 it fell to 20%. The downward trend was accelerated in 1936 by the discovery of H. C. Hagedorn's protamine and D. A. Scott and A. M. Fisher's protamine zinc insulin when only 3.6% of 929 diabetics after discharge from one clinic succumbed to this needless complication. Treatment of the actual coma state also progressed, but even in 1943 the treatment of coma was often unsuccessful. It is therefore worthy of mention that in one recent series of 104 successive diabetic coma cases death occurred in but one instance. Success in this series was attributed to the preliminary organization of the clinic for emergency admissions, available help from the laboratory day and

night, Sundays and holidays, and the prompt and detailed clinical and nursing care of such cases by physicians of wide diabetic experience, the use of insulin in adequate dosage, the alleviation of dehydration with salt solution and especially to the avoidance of confusing or obscuring the blood picture by the employment of glucose or alkalies. No diabetic should die of diabetic coma.

Diamonds. World production of diamonds is shown in the accompanying table; official figures on output are lacking in many cases and the data for the war years are those of S. H. Ball.

World Production of Diamonds
(Thousands of carats)

	1938	1939	1940	1941	1942
Angola	651	690	784	787	792*
Belgian Congo	7,206	8,360	9,603	5,866	6,018
Gold Coast	1,297	1,088	825*	1,000	1,000*
Sierra Leone	690	600*	750	850	850*
South Africa	1,238	1,250	543	112	106
South West Africa	155	35	30	47	60
Brazil	235	350*	325	325	300
Others	148	127*	152*	118	128
Total	11,620	12,500	13,012	9,105	9,254

*Estimated.

Production in 1942 was thought to have improved slightly over 1941, though outputs in most of the major producing countries were far below their usual levels. With Congo, Gold Coast, Sierra Leone and Angola producing 93% of the total output, there was a higher percentage than ever of industrial stones in the total, but so long as war demand lasted, industrials would be of more importance than gem stones. It was estimated that sales of industrial stones were in 1943 approaching in value the sales of gem stones. There were three reasons for this shift in the relative position:

1. Gem stones were a luxury, the sale of which was not greatly encouraged, while industrial stones were essentials in the war program.
2. War production heavily increased the already rapidly growing uses for industrial stones.
3. While gem sales served to increase an ever-growing pool of stones in the hands of the buying public, from which there were no deductions except irretrievable losses and such small amounts as were involved in recutting old gems, industrial stones were subject to such heavy wear that the average life in constant use was about two years.

The scale on which industrial diamonds were in use was not known, but it was quite possible that replacement of wear alone, without considering additions for new uses, might be of the order of two or three million carats a year, and possibly even more.

DIAMOND PRODUCTION OF THE WORLD and the major producing countries as computed by *The Mineral Industry*

Sales of diamonds by the Diamond Trading company increased from about £7,000,000 in 1941 to £10,500,000 in 1942, and were expected to exceed £17,000,000 in 1943, with most of the increase in industrial stones.

Belgium and the Netherlands were no longer factors to be considered in the cutting trade, which was in 1943 carried on chiefly in Palestine, United States, South Africa, Great Britain, Puerto Rico, Cuba and Brazil. The number of cutters available was only a fraction of the number formerly working in the Low Countries, and many of these, especially in the United States and Great Britain, were engaged in the preparation of industrial stones, rather than in the cutting of gems.

In Nov. 1943, it was reported that a 530-carat diamond had been discovered in Sierra Leone. This would rank about eighth in size among the large stones on record. (G. A. Ro.)

Diatomite. Production was not reported in the United States, where about one-third of the world's output is made; production was estimated at 114,300 long tons in 1941, and presumably increased somewhat after that year, since many of the uses were enlarged by war demands. (G. A. Ro.)

Dickinson, Luren Dudley (1859–1943), U.S. politician, was born April 15 in Niagara county, N.Y. He was educated in Michigan's public schools and taught rural school for 19 years before entering the political arena. He was state representative for three terms between 1897 and 1908, state senator for one term and was seven times elected lieutenant governor of Michigan. In March 1939, he succeeded to the governorship after the death of Gov. Frank D. Fitzgerald but lost his seat in the 1940 elections. Shortly after he took over the executive office, Mr. Dickinson gained national prominence as a crusader against "high life in high places." He died at his farm near Charlotte, Mich., April 22.

Dickinson, Willoughby Hyett Dickinson, 1ST BARON (1859–1943), British statesman, politician and pacifist, was born April 9, the son of a British parliamentarian. He attended Eton and Trinity college, Cambridge, studied law and was called to the bar in 1884. He served on the London county council, 1889–1907, and was its chairman in 1899. He was chairman of the London Liberal federation, 1896–1918, was made a privy councillor in 1914. He was created first Baron Dickinson of Painswick in 1930 and joined the Labour party the same year. Lord Dickinson, who was chairman of the League of Nations society, 1915–18, was widely credited with being the originator of the League of Nations. In 1923, he was substitute delegate to the Geneva assembly. He was also life president of the World Alliance for Promoting International Friendship Through the Churches. He died at his home in Painswick, England, June 1.

Dictatorships: *see* COMMUNISM; FASCISM; GERMANY; JAPAN; RUMANIA; SPAIN; UNION OF SOVIET SOCIALIST REPUBLICS.

Dietetics. The Food and Nutrition board of the National Research council reported on dehydrated fruits and vegetables, on fats, on milk, and on the nation's protein supply. One group sponsored a survey of dental caries, another the nutritional aspects of ageing, while a different group reported on early recognition of dietary deficiencies. The recommended dietary allowances formulated by the Food and Nutrition board in 1941 were used to guide the planning and appraisal of peace

and wartime dietaries. Studies indicated that adults may be maintained on diets somewhat lower in thiamin and riboflavin than the figures given in the dietary allowances. Additional recommendations were made by the Food and Nutrition board relative to iodine, copper and vitamin K.

Further investigations were reported on the essential amino acid requirements of humans, and on the amino acid composition of foods. Tools were thus provided to construct a program for supplying an adequate protein intake with the use of supplementary vegetable proteins where there is a shortage of animal proteins.

The Committee on Food Composition appointed by the Food and Nutrition board of the National Research council assembled, co-ordinated and appraised these recent data. Data were assembled to meet the need for information concerning the composition of commercially produced dehydrated vegetables and soups. As a supplement to this survey comparison was made of various special methods of dehydration; it was found that the use of heated, natural gas as the dehydration atmosphere resulted in high vitamin C retention in certain vegetables. The committee also correlated and planned experiments to determine losses of nutrients during the processing, preparation and storage of foods.

Further appraisals of the dietary intake of certain population groups in terms of currently accepted standards indicated a need for continued efforts to raise the level of intake of various nutrients. The use of foods of high nutritive potency provides one of the most effective means of bringing about a quantitatively significant increase in intake. In the large-scale feeding of industrial workers, dried yeast was incorporated in various dishes with considerable success. The tremendous expansion in the production of soya products permitted United States civilians to use large quantities of these high protein products. In 1943, 300,000,000 lb. of soya products were made available, representing 140,000,000 lb. of high-quality and low-cost protein, as well as substantial amounts of vitamins of the B complex, and iron, phosphorus and calcium. This offered enough protein for a full year's requirement for more than 2,000,000 people. The Office of Foreign Relief and Rehabilitation Operations developed food products of high nutritive potency such as spaghetti to which dried egg and soybean flour were added; and dehydrated soup powder which contained split peas, soybeans, dried skim milk, brewer's yeast and seasoning. Since these products were for foreign consumption, each of the processed foods was subjected to acceptability testing with nationality groups. The Committee on Food Habits of the National Research council assumed responsibility for this project. Flour enrichment in the United States was further modified. Riboflavin limits were not less than 1.2 or more than 1.5 mg. per pound of flour, while thiamin was from 2.0 to 2.5 mg. per pound of flour. The lower and higher limits for niacin were 16.0 and 20.0 mg. per pound of flour, while iron was not less than 13.0 or more than 16.5 mg.

The nutritional analysis of the estimated civilian food supply in the United States for the full year 1943 indicated that the per capita consumption of most nutrients would be slightly higher than the yearly average during 1935–39. The increases in the consumption of calcium, riboflavin and thiamin were a result of the further enrichment of white flour and the increased consumption of fluid milk. With rationing of the more important foods and with greater purchasing power, more people received a fairer share of the total nutrients in 1943 than in the prewar period. According to V. P. Sydenstricker, this seemed to be the situation in England also. (*See* also FOOD RESEARCH; VITAMINS.)

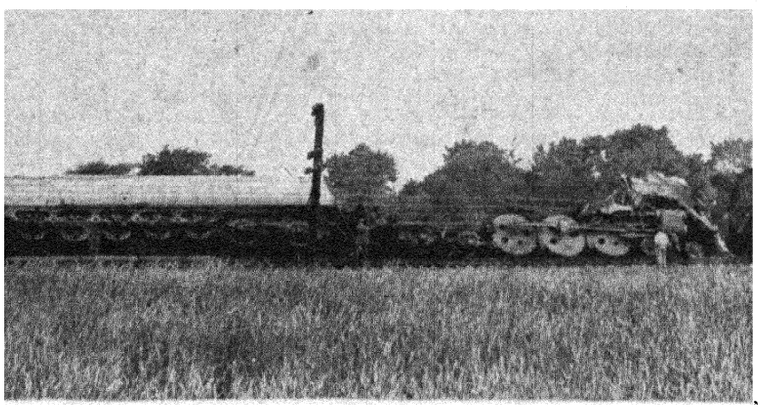
Disasters.

During 1943 loss of life and property in accidents included the following:

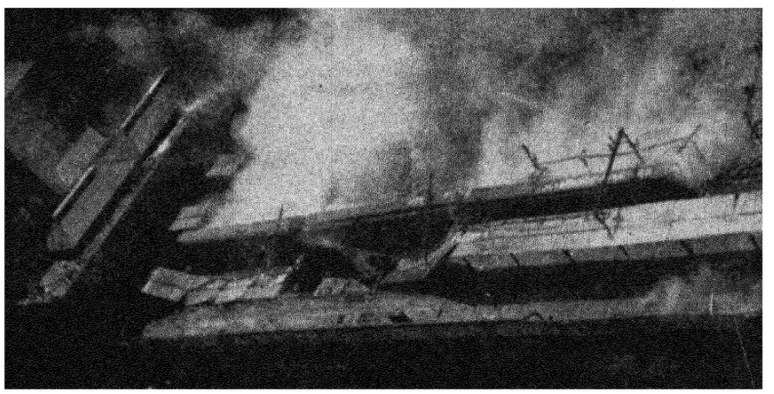
Aviation



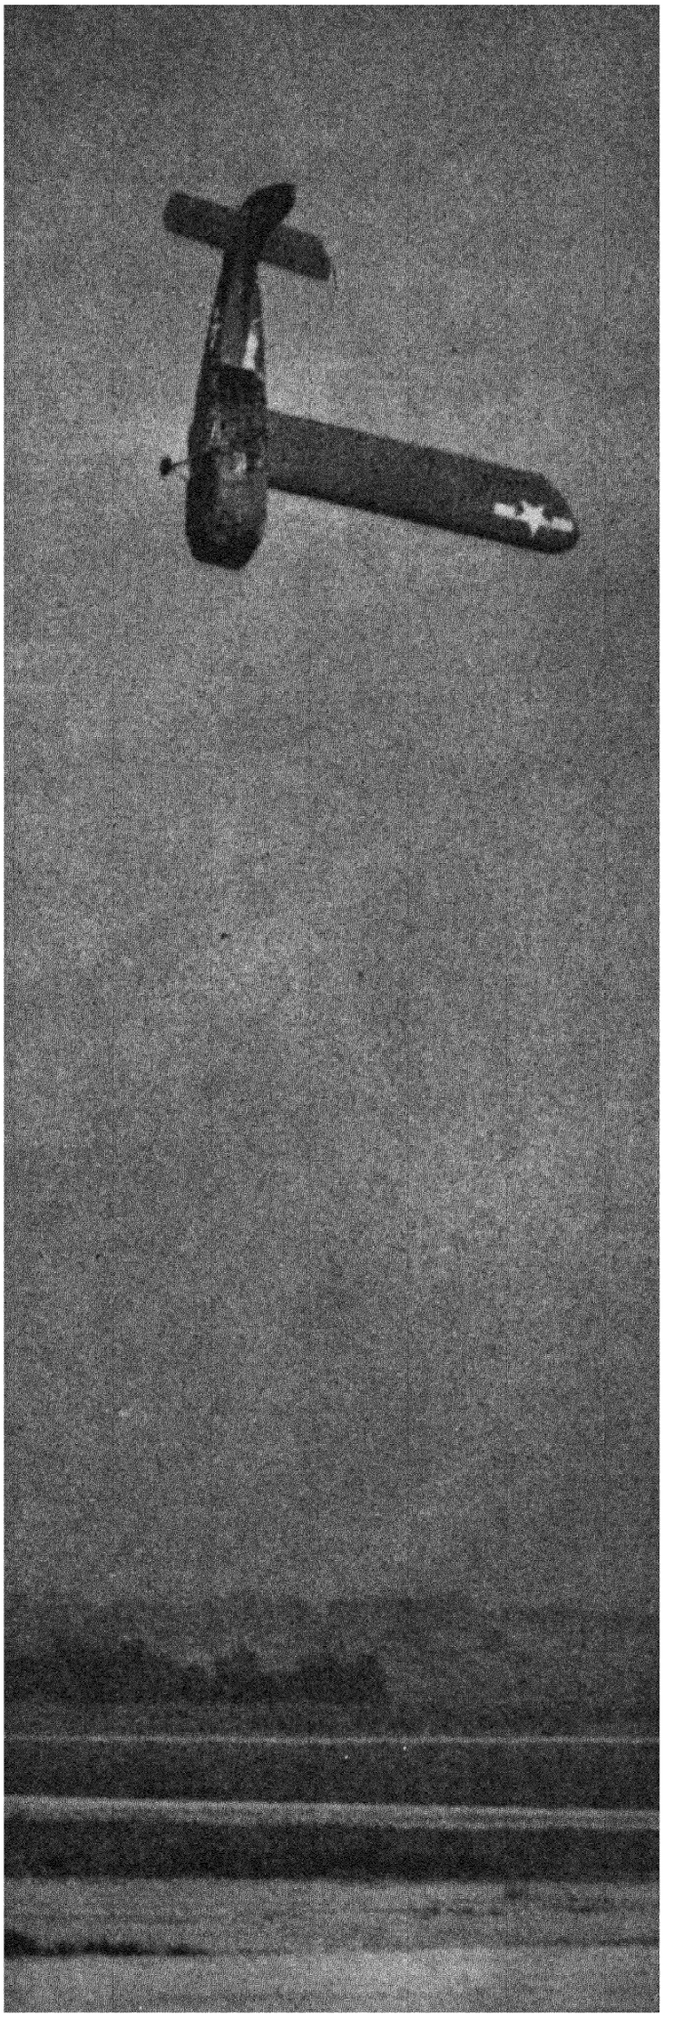
Jan. 15	Near Paramaribo, Dutch Guiana. Maj. Eric Knight, novelist, was among 35 persons killed when transport plane crashed in jungle.
Jan. 22	Pacific ocean. U.S. navy reported that transport seaplane carrying crew of 9 and 10 naval officers was more than 24 hrs. overdue on flight from Pearl Harbor to San Francisco.
Jan. 26	Near Flomaton, Ala. Brig. Gen. Carlyle H. Walsh and nine others were killed in crash of army transport plane.
Feb. 9	Newfoundland. Ferry-command plane crashed, killing 13 passengers and crew of 6.
Feb. 18	Seattle, Wash. Fourteen persons were killed, 13 others were injured when bomber crashed into packing plant. Twenty employees in plant were reported missing.
Feb. 22	Lisbon, Portugal. Four persons were killed and about 20 others were missing after a Clipper flying boat crashed in landing on Tagus river.
May 3	Iceland. Lt. Gen. Frank M. Andrews, Bishop Adna W. Leonard and 12 others were killed in crash.
May 13	Near El Paso, Tex. Fifteen men were killed when two army bombers collided at army field.
May 20	Chicago. Twelve persons aboard army bomber met death when plane crashed into giant gas storage tank and set aflame 18,000,000 cu.ft. of gas.
June 6	Near Austin, Nev. Bodies of 15 persons were found in wreckage of army plane; plane had been missing for 6 days.
July 4	Gibraltar. Premier Wladislaw Sikorski of Polish government-in-exile, his daughter, Mme. Sophia Lesniowska, and 14 others were killed in crash of plane soon after taking off from Gibraltar.
July 28	Near Bowling Green, Ky. Twenty persons were burned to death when air liner crashed and exploded.
Aug. 1	St. Louis, Mo. Ten persons, including Mayor William D. Becker of St. Louis, were killed in crash of army troop glider.
Aug. 26	Rio de Janeiro. Crash of air liner into Rio de Janeiro bay brought death to 18 of 21 persons aboard plane.
Sept. 20	Maxton, N.C. Crash of army transport plane at Laurinburg-Maxton airfield resulted in death of 25 persons aboard craft.

Fires and Explosions

Jan. 31	Near Seattle, Wash. Twenty-eight patients were burned to death in fire that swept through sanatorium for aged invalids.
March 24	Ravenna, Ohio. Ten workers were killed and two others were injured in explosion at government ordnance plant.
March 28	Naples, Italy. At least 79 persons were killed and 1,179 were injured when an ammunition dump in port area blew up. (Berne dispatches said at least 400 were killed and 2,000 injured.)
May 4	Elkton, Md. Munitions plant blast took toll of 13 known dead.
May 5	La Follette, Tenn. Ten miners were trapped and killed in coal mine explosion.
July 9	Chicago. Seven firemen were killed and two others severely injured in collapse of flame weakened roof and walls of four-story structure.
July 12	Eglin Field, Fla. Seventeen officers and men were killed and 51 others injured in accidental explosion at army air base.
Aug. 19	Kearny, N.J. Thirteen persons were killed in explosion that destroyed war plant.
Aug. 28	Birmingham, Ala. Nineteen persons were killed and 25 others injured when two gas explosions sealed coal mine tunnel.
Sept. 7	Houston, Tex. Forty-five men died in fire that swept old hotel in Houston's midtown section.
Sept. 12	Philadelphia. Fire swept through Broad Street station and adjacent buildings, destroying large part of terminal, and causing damage estimated at $250,000.
Sept. 17	Norfolk, Va. Twenty-four persons were killed and 250 others injured when "ammunition in transit" at Norfolk naval air station blew up.
Dec. 24	New York city. At least 17 persons were burned to death when flames razed dilapidated lodging house.
Dec. 25	Wildwood, N.J. Fire that started on ocean pier destroyed three theatres, two hotels, an amusement pier, 25 stores and nine homes.



A BURNED-OUT JOURNAL BOX on a coach caused the worst U.S. train wreck in 25 years Sept. 6, 1943, at Philadelphia, Pa. Seventy-nine passengers of the Pennsylvania's "Congressional Limited," bound from Washington to New York city, were killed



Above: LOCOMOTIVE AND TENDER of the "Twentieth Century Limited" lying on an embankment after the locomotive boiler exploded Sept. 7, 1943, near Canastota, N.Y., killing three crewmen and derailing the train

Right: WITH ITS RIGHT WING SHATTERED, this glider plunged to earth Aug. 1, 1943, at the St. Louis, Mo., airport, carrying ten men to their death, including the mayor of St. Louis. A faulty wing connection caused the crash

Below: THE PENNSYLVANIA RAILROAD'S Broad Street station in Philadelphia was partially destroyed by fire Sept. 12, 1943. Damage was estimated at $250,000

Marine

March 5 Near Carrabelle, Fla. Fourteen soldiers were believed drowned during manoeuvres in Gulf of Mexico off Florida when landing ramp of their army barge was accidentally lowered.

April 19 Near Sayville, N.Y. Seven sea scouts were drowned and three others were 'ost when their cabin cruiser capsized near shores of Sayville.

June 6 Near Norfolk, Va. Eighty-four men were killed in explosion that followed collision between ammunition ship and oil tanker off east coast of U.S.

Aug. 31 Near east coast Canadian port. Death of 30 seamen in collision of two Allied merchantmen off eastern seaboard was disclosed.

Oct. 20 Off Florida coast. Eighty-eight men died when two blacked-out tankers, one of which carried thousands of tons of aviation gasoline, collided and exploded off the Florida coast.

Natural Disasters

Jan. 1 Point Pleasant, W.Va. Ohio river flood waters caused estimated damage of $1,500,000, left about 17,000 homeless in northern West Virginia communities and temporarily halted industry in war plants.

Nov. 26 Ankara, Turkey. About 1,800 persons were killed and 2,000 others were injured in series of quakes that rocked northern Turkey, Ankara dispatches reported.

Railroad

May 23 Near Delair, N.J. Fourteen persons were killed and more than 100 were injured when passenger train crowded with week-end tourists jumped tracks.

June 4 Bombay. Fifty-two persons were killed and 100 were injured when Bombay-Calcutta mail train crashed.

Aug. 30 Wayland, N.Y. At least 27 persons were killed when freight engine moving from siding crashed into locomotive of crack express train.

Sept. 6 Philadelphia. Seventy-nine persons were killed and more than 100 others were injured when over-heated journal on end of car axle broke, derailing Congressional Limited as it was rounding curve within city.

Sept. 7 Near Canastota, N.Y. Three persons were killed and seven were injured when 20th Century Limited jumped tracks near Wampsville crossing.

Dec. 16 Near Rennert, N.C. Seventy-two persons were killed and scores injured when three coaches of a southbound train were derailed and fell on adjoining tracks directly in path of speeding northbound express.

Miscellaneous

March 4 London. 178 persons were killed and 60 others were injured when woman carrying baby tripped on stairs, causing panic at entrance of air raid shelter during German air attack.

(*See* also ACCIDENTS.)

Disciples of Christ. Statistics as of June 30, 1943, showed a total membership of 1,679,012 in the United States and Canada (Canada 9,341). This was a net gain of 14,069 for the year—a slight offset to a net loss of 107,023 for the previous year. Reported additions were about normal—46,760 by baptism, 43,827 otherwise, or 2,861 less than in 1942. (Actual additions must be more than reported, to balance losses by death and provide even a slight increase.) In 1943, there were 8,050 churches in the United States and Canada (a gain of 48), and 7,801 ministers (a gain of 108). Chaplains in service increased from 203 in 1942 to 339 in 1943. Disciples had churches in 39 other countries, most of which were not mission fields. There were 13,030 members in Great Britain, 30,605 in Australia, 4,222 in New Zealand (losses of 415, 455 and 309, respectively). There was no report in 1943 from Poland, previously listed as having 65 churches and (estimated) 40,000 members. The world membership in 1943 was 1,842,123—a gain of 15,689, or nearly double the loss in 1942. Receipts and expenditures increased: for local church maintenance in the United States and Canada to $15,109,797 (gain $1,629,423); for missions and benevolences, almost tripled, to $5,505,779 (gain $3,482,165). Collection of the Emergency Million, subscribed in 1942, was completed in 1943, liquidating the long-standing debt of the United Christian Missionary society and furnishing funds for special war projects. The foreign missionary agency was able to continue its work in all fields except Japan and the Philippines. The missionary magazine, *World Call*, increased its monthly circulation to 46,154 (gain 6,604, after a gain of 3,953 the year before). The latest international convention of Disciples of Christ (U.S. and Canada) met at Grand Rapids, Mich., July 28–Aug. 2, 1942. The next, scheduled for May 1944, was expected to be postponed until October. Its president in 1943 was the Rev. C. E. Lemmon of Columbia, Mo.

(W. E. GA.)

District of Columbia: *see* WASHINGTON, D.C.

Ditter, J. William (1888–1943), U.S. congressman, was born Sept. 5 in Philadelphia, Pa. He received a law degree from Temple university law school in 1913, and was admitted to the Pennsylvania bar the same year. In 1921 he taught history and commerce in Philadelphia high schools, and in 1925 he established a private law practice. He was elected on the Republican ticket to the national house of representatives by the 17th Pennsylvania district in 1933, and served in that capacity until his death. While in congress, Ditter was chairman of the Republican congressional committee and a member of the powerful house appropriations committee. As ranking minority member of the appropriations subcommittee on naval affairs he maintained a close working relationship with the navy department. He was killed when the naval plane in which he was flying from Massachusetts to Philadelphia crashed on the night of Nov. 22.

Divorce: *see* MARRIAGE AND DIVORCE.

Dodecanese: *see* ITALIAN COLONIAL EMPIRE.

Doenitz, Karl (1892–), German naval officer, was born in Mecklenburg province. He was commissioned an ensign in the Imperial German navy in 1913 and served in the submarine division during World War I. Taken prisoner by the British in 1918, he was subsequently committed to a Manchester asylum for the insane. His repatriation followed in 1919, but the suspicion existed that he had feigned insanity to hasten his release. After the war, he resumed his service with the German navy and was associated with the U-boat service. In 1933, Doenitz was believed engaged in building submarines in hidden shops and in training the crews to man them, in violation of the Versailles treaty. By Oct. 1935 the first flotilla was afloat, and in 1936 Doenitz was linked publicly with the nazis when he was named commander of the 1st submarine flotilla. His rise was swift. A commodore when World War II started, he was promoted to the rank of rear admiral in Nov. 1939, and in Jan. 1943 he replaced Grand Admiral Erich Raeder as commander in chief of the German navy. His appointment gave strength to the belief that the Germans were putting more reliance on U-boat campaigns to halt the flow of U.S. supplies to Europe. Employing his "wolf-pack" method of attack, Doenitz inflicted grave losses upon Allied shipping. However, improved escort technique and constant patrol, both by sea and air, enabled the Allies to overcome the U-boat menace.

Dog Racing. Boston again proved the capital of dog racing during 1943, with the Wonderland track setting records in crowd and pari-mutuel handle. Because of the transportation problem, the Massachusetts Racing commission refused licences to Massoit and Taunton tracks but the sport still managed to hold up with the usual dozen tracks in operation throughout the nation. Although attendance at Florida tracks fell off as much as 30%, betting held fairly close to the 1942 season and the handle at Miami Beach, Jacksonville and Tampa was each over that of the previous year. Fern Nature was recognized as the champion racer of Florida, winning the Flagler derby and other stakes. Gypsy Band and Hetty Andrews featured the racing at Boston.

(M. P. W.)

Dog Shows: *see* SHOWS.
Dominica: *see* WEST INDIES, BRITISH.

Dominican Republic. A West Indian republic occupying the eastern two-thirds of the island of Hispaniola or Haiti. Area, 19,326 sq.mi.; pop. (1939 est.) 1,654,993. The greater part of the population is concentrated in two areas: the Cibao lowlands in the north, and around Ciudad Trujillo in the south. At least 75% of the population is of mixed blood. Capital city: Ciudad Trujillo (formerly Santo Domingo) (pop. *c.* 100,000); other cities are: Santiago de los Caballeros (33,919) and Puerto Plata (11,777). Religion: Roman Catholic; language: Spanish. President in 1943: General Rafael Leonidas Trujillo Molina.

History.—No change in the administration policy of cooperation in hemisphere defense took place in 1943. Official censorship of all mediums of communication was established April 16. United States representation, and that of Peru, was changed to the status of embassy during the year.

While shipping operations improved, war conditions continued to cause shortage in the Dominican Republic, as everywhere, of such items as gasoline, iron and steel, and electrical appliances. Due to the lack of tires in particular, truck operation was reported as reduced by 60%, with horse-drawn vehicles used wherever available. Control commissions were set up for several commodities, such as textiles and nails, and in spite of price-fixing legislation, the cost of living steadily increased. Thanks to an agricultural diversification program started about a decade ago, basic food conditions were much better than in some other Caribbean states, and some foodstuffs were available for export.

Crops for 1943 were generally good. The cocoa harvest was unofficially estimated at 240,000 bags, and exports for the season were 50% over 1942. Sugar production, estimated at 473,000 tons, lower than the 530,000 tons of 1942, was not a serious problem since much of the previous year's crop had not been moved. Little unemployment was reported, largely due to a government building program in preparation for a centennial celebration in 1944.

The coffee quota of the republic for the 1942–43 year, under the inter-American coffee agreement, was increased from 132,554 bags to 194,691 bags.

Education.—In 1941 the educational system of the republic had schools and enrolments as follows: 616 basic primary, with 77,049 students; 147 graduate primary, with 46,592 students; 16 secondary, 3,133 pupils; 57 vocational, 3,702 students; 5 adult night, 584 students. The budget (1941) was set at 1,330,168 pesos for education; local governments contributed an additional 56,561 pesos.

Finance.—The monetary unit is the peso, equal in value to the United States dollar. Revenue in 1942 was 14,943,061 pesos; expenditures, 12,788,925 pesos. The external debt (Dec. 31, 1941) was officially indicated as 14,430,000 pesos; it was unofficially estimated as having been reduced to approximately 10,000,000 pesos by the end of 1943.

Trade and Communication.—Trade figures for 1941, the latest year available, showed a total of 28,862,968 pesos for the year (1940: 28,812,789). Imports were valued at 11,739,031 pesos (up 11%); exports at 17,739,031 pesos (down 6.4%). Raw sugar is the largest item of export; others are molasses, cacao, coffee, rice, cattle, gold. Principal imports are cotton and manufactures, chemicals and pharmaceuticals, machinery and paper products. In 1941 the United States took 51% of Dominican exports. The republic had a favourable trade balance with the United States of $362,000 in Sept. 1943.

The republic has 163 mi. of public railway and 622 mi. on sugar plantations. There were approximately 1,190 mi. of first-class highway, 2,150 mi. of unimproved; the highway appropriation was set at $461,650. During the year four schooners were built for inter-island trade.

Manufacturing.—A total of 1,829 manufacturing establishments listed for 1941 had a capital investment of 75,969,535 pesos; the total number of workers was approximately 38,000.

(D. RD.)

Donations and Bequests. Giving away of money by the American people surged to an all-time high in 1943, with individual and institutional contributions estimated at more than $2,000,000,000.

Increased national income and multiplying war-charity appeals were probably the obvious causes for the diversion of this vast amount of money to philanthropic causes, but it was also true that the lowering of income tax exemptions, which caused more persons to file returns, brought to light deductions for philanthropic purposes by those persons in the lower income brackets who, heretofore, had been the unknown quantity in giving.

In 1941, the total contributions to philanthropic funds amounted to $1,465,024,000 from all sources and, of this amount, $1,236,711,000 was reported to the government as contributions of individuals. In 1942, this amount jumped to $1,916,098,000, of which $1,669,541,000 came from individuals.

It is on the basis of these figures, and the still further lowering of income tax exemptions, that the estimate is made that American philanthropic funds would stand at well over $2,000,000,000 for 1943.

The continued study by The John Price Jones corporation of New York of publicly announced gifts of $1,000 and more in eight large cities (New York, Chicago, Washington, Philadelphia, Baltimore, St. Louis, Boston and San Francisco) presented a gauge of the trend in American giving for the year 1943. The total of gifts in these cities for 1943 was $135,203,402 compared with $78,269,358 for 1942. This study showed that the most popular types of philanthropy were American war organizations, such as the Red Cross and National War Fund, which received $36,521,930; community war chests, that is, community chests which included in their quotas funds for war emergency work, $71,976,602; and foreign relief, $10,157,072.

It is interesting that, although most of the philanthropic funds for 1943 went to these organizations, giving to other types of organized philanthropy, in most cases, showed gains over 1942.

The study of bequests for 1943 in these eight cities showed that $40,710,881 was willed for charitable purposes. In the case of bequests, the trend was as in other years, $16,925,831 going to educational institutions, $7,780,926 for health purposes, $5,253,126 to fine arts and $4,820,876 to religious organizations.

New York continued to be the most generous city with philanthropic gifts of $51,044,470 and bequests of $29,660,303. (*See* also CARNEGIE TRUSTS; COMMONWEALTH FUND, THE; COMMUNITY CHEST; FALK FOUNDATION, THE MAURICE AND LAURA; ROCKEFELLER FOUNDATION; ROSENWALD FUND, THE JULIUS; RUSSELL SAGE FOUNDATION; WAR RELIEF, U.S.) (J. P. J.)

Doolittle, James (1896–), U.S. army air officer, was born Dec. 14 at Alameda, Calif. He joined the army as a flying cadet during World War I and became an officer, but the army refused to let him go overseas, declaring he was too valuable as an instructor. After the war, he studied engineering, graduating from Massachusetts Institute of Technology in 1925 with a doctor of science degree. An expert pilot, he toured European and South American capitals, thrilling crowds with stunt flights. In 1930, he won the Harmon trophy

for his experimental flights; in 1931, he won the Bendix trophy race from Burbank to Cleveland; in 1933, he won the Thompson trophy. He then retired from racing to join the army board studying reorganization of the air corps. In July 1940, he was ordered back to active duty as a major in the air corps reserve and in Jan. 1942, he was promoted to lieutenant colonel in the air corps. On April 18, 1942, Doolittle electrified the world by leading a U.S. bomber squadron in a spectacular daylight raid over Tokyo. For this exploit, he was awarded the congressional medal of honour by President Roosevelt and was promoted to the rank of brigadier general. He was sent to Africa with Gen. Dwight D. Eisenhower, and on Nov. 21 was promoted to major general. On Feb. 26, 1943, he became head of the bomber command in the Northwest Africa air forces under Maj. Gen. Carl W. Spaatz and British Air Marshal Sir Arthur Tedder. A few days after Eisenhower was named invasion commander, Doolittle was appointed (Dec. 28, 1943) to head the 8th U.S. air force, which included all U.S. air units in Britain.

Drew, George Alexander (1894–), Canadian politician, and premier of Ontario. He was born at Guelph, Ont., May 7, and received his education at the Collegiate institute of Guelph, Upper Canada college, and the University of Toronto. His military career began in 1910 when he joined the 16th battery Canadian artillery at Guelph. He had a distinguished record in World War I going overseas in 1915. Wounded in 1916, he was invalided home, but was not discharged till June 1919. Among Drew's writings are *Canada's Fighting Airmen, The Truth about the War,* etc. Admitted to the bar in 1920, he practised in Guelph till 1925, and then in Toronto. Entering the provincial legislature, he became the leader of the Progressive Conservative opposition. In 1942, Drew denounced the Canadian government's action in despatching troops to Hongkong. Proceedings were initiated against him, but were later dropped. After the formation of the Progressive Conservative party at the Winnipeg convention, Dec. 1942, Drew returned to organize the party's forces in Ontario. In the general provincial elections, Aug. 4, his party was successful in securing the largest number of seats; Drew became premier, assuming the portfolio of education. (J. I. C.; S. LEA.)

Drought. The year 1943 as a whole did not have notably deficient moisture in any of the important agricultural regions of the world.

In the Pacific, Asiatic and Australian theatres of war no important drought conditions were reported, although because of war restrictions the information coming from these areas was very meagre. In Europe, the latter half of the year 1943 appeared to have been more or less dry in the northern portions and wet in the Mediterranean region. During a long period in autumn, abnormally high pressures existed over the British Isles and neighbouring regions, producing a drought which in some localities reached serious proportions. The winter grasses and cereals were retarded in their growth during that portion of the year. In Italy, on the other hand, troops at this time were fighting through rain and mud.

In the United States, the conditions were favourable during the growing season in most localities, but a fall drought similar to one which occurred in 1939 affected some of the more important agricultural areas. In the winter wheat areas where the plants are supposed to germinate and begin their growth in the fall, the prospective crops were seriously reduced. In the great winter wheat region of Kansas, the November precipitation was only 17% of the normal for that month over the state as a whole, and the ample rains which finally came in December were, in some localities, too late to restore the wheat to its proper condition. In Oklahoma, Arkansas and parts of Kansas, November was the driest on record since 1910. The drought was accompanied by numerous dust storms. Many farmers planted wheat in the dust, expecting rain to come. Considerable quantities failed to germinate or dried after germination.

The region of autumn drought extended from Colorado through the Dakotas to the Great Lakes region and southward to northern Tennessee, Arkansas and northern Texas. Thus, approximately 17 states were more or less seriously affected by the drought. Throughout the entire region the water shortage affected the condition of pastures and necessitated stall or yard feeding of stock. Water had to be hauled for cattle. The drought conditions also extended through West Virginia and into North and South Carolina, parts of Georgia and Alabama. During the three fall months of September, October and November the following percentages of the normal precipitation were measured in the various states: North Dakota 55%; South Dakota 92%; Nebraska 56%; Kansas 72%; Oklahoma 75%; Iowa 64%; Illinois 71%; Ohio 59%; Kentucky 63%; West Virginia 64%; North Carolina 55%; South Carolina 57%.

Late summer and early fall drought conditions occurred in certain eastern states, particularly Pennsylvania, New Jersey, Delaware and Maryland. The drought in the Carolinas, parts of Georgia and Alabama started in late summer. In Pennsylvania, September was the driest ever recorded. July and August were also dry. Water had to be hauled and special feeding had to be employed for livestock. Many wells, previously dependable, dried up and streams dwindled until special sanitary precautions had to be taken. Crops were, of course, extremely poor. The planting of winter grains was delayed and fall plowing was impossible in the hard, dry soil. In New Jersey, August was extremely dry, and important truck crops in the southern part of the state were greatly curtailed. In some sections the second cutting of alfalfa was almost a complete failure. In Maryland, the summer drought ended with ample rains on Sept. 30, only after about 50% failures of most crops. Dairying suffered through lack of adequate pasturage.

Dust storms which usually have their maximum occurrence during the spring months were more commonly observed in the autumn of 1943. In South Dakota, several severe but somewhat localized dust storms were observed in October, while dust storms and wind erosion of the bare soil occurred through extensive areas of Kansas, Nebraska and Oklahoma. In some cases in these sections, the small quantity of winter grains which penetrated through the dry soil later had the soil blown from the roots in dust storms.

In addition to dust there were numerous prairie and forest fires. The forest fire conditions were particularly noted in Arkansas where large stands of timber, rendered inflammable by the drought, were destroyed by fire.

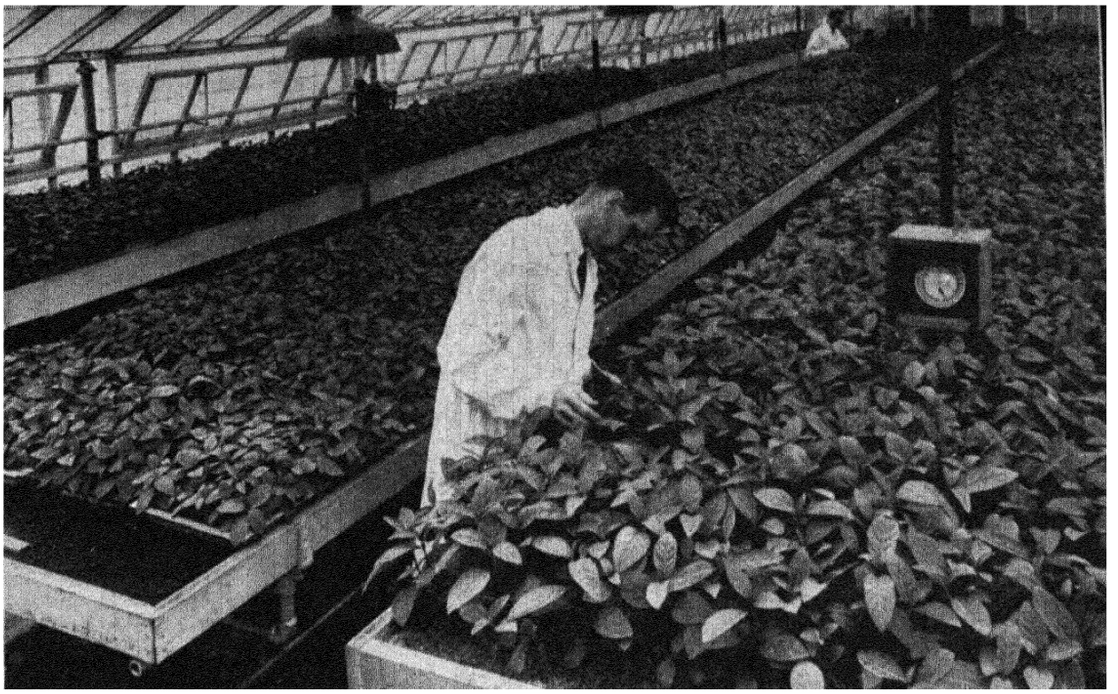
South America during 1943 appeared to enjoy more than ample rains throughout. (*See* also AGRICULTURE; IRRIGATION; METEOROLOGY; SOIL EROSION AND SOIL CONSERVATION.)

(H. R. B.)

Drugs and Drug Traffic. The drug industry in the U.S. was called upon to increase its output of essential items while facing wartime disruptions resulting from shortages in skilled manpower, in basic raw materials, and in equipment. To safeguard consumers from the viola-

tions such conditions might foster, the Food and Drug administration gave increased regulatory attention to possible breakdowns of control in the manufacturing and packaging of drug products and to unauthorized substitutions for scarce ingredients. During the shortage of physicians for civilians, public safety required intensified surveillance over the directions, warnings and therapeutic claims on the labels of preparations with which persons might attempt self-medication.

In the fiscal year 1943, attention was given to the output of 2,738 manufacturers of drugs, therapeutic devices and vitamin preparations destined for both civilian and military use. Seizure of 287 violative shipments was effected. The consignments thus removed from consumer channels comprised 16 preparations alleged to be dangerous to health; 107 bearing false and misleading claims, inadequate directions and warnings, or without mandatory label statements; 111 items differing from required standards of potency; 3 containing filth and decomposition; and 50 that were short in contents or otherwise constituted economic cheats. Fewer drug products containing dangerous ingredients or mixtures were seized than in 1942; the number of substandard-drug seizures almost doubled. Permission was given for the introduction of 148 new drugs into interstate commerce after the filing with the federal security administrator of applications establishing their safety for use.



Court decisions rendered in the 1943 fiscal year affecting public protection under the federal drug laws included an appeals court ruling that an article may be misbranded by the addition of false and misleading circulars after shipment, while it is being held for sale. (W. G. Ca.)

League of Nations.—The opium section of the League of Nations continued to function despite difficulties of communication. The Permanent Central Opium board discharged its duties even though seriously impeded by current conditions. Statistical returns were received from 50 governments out of 66 contracting parties and from 62 out of 99 dependencies and colonies. No government denounced the conventions. There were three accessions to the conventions since the outbreak of the war. International control continued and was likely to be operative over a considerable part of the world. Its complete re-establishment would be a matter of utmost urgency on cessation of hostilities. In all belligerent territories, with the exception of Japan, the system of import and export certificates for narcotic drugs continued in force.

Leaks developed. Much Iranian opium manufactured by the government monopoly found its way into the illicit traffic. Clandestine production of opium in Mexico continued on a large scale. The Mexican government took stringent measures to stamp out this traffic.

Opium supplies, in contrast to other strategic materials, appeared to be satisfactory in all territories. Several South American countries started opium production on a small scale.

A substitute for morphine, known as demerol in the United States and dolantin in Europe and South America, appeared on world markets. It was placed under anti-opium legislation in every country where it was consumed. A recommendation was to be made to place it under Article 10 of the Geneva Narcotic convention of 1925.

CINCHONA SEEDLINGS in a greenhouse of the U.S. department of agriculture at Glenn Dale, Md. Plantings were made in quantity during 1943 to replace the supply of quinine from the Netherlands Indies cut off by the Japanese in 1942. The bark of the cinchona tree yields quinine in about ten years

On Sept. 21, 1943, the United States government addressed aide-memoire to the British, Netherlands and other interested governments in regard to the suppression of the nonmedical use of narcotic drugs in areas in the far east occupied by Japanese forces when such areas would be reoccupied by the armed forces of the United Nations.

The British and the Netherlands governments announced in November that they had decided to prohibit the use of opium for smoking and to abolish opium monopolies in their territories when those territories were freed from Japanese occupation.

Duncan, Sir Patrick (1870–1943), British politician, was born Dec. 21. He attended Balliol college, Oxford, and entered the colonial service in 1894. He was made treasurer of the Transvaal colony in 1901, succeeded to the post of colonial secretary, 1903–06, and was acting lieutenant governor in 1906. Sir Patrick held the interior, public health and education ministries, 1921–24, and was minister of mines, 1933–36. He assumed the office of governor general of the Union of South Africa in 1938, the first South African resident to become a representative of the king in the dominion. It was during his governorship that Premier Hertzog sought to prevent a declaration of war against Germany at the outbreak of World War II, a measure which Sir Patrick helped to defeat. As a result Hertzog resigned. Sir Patrick died in Pretoria, Union of South Africa, July 17.

Du Pont, Richard Chichester (1911–1943), U.S. glider champion, was born Jan. 2 in Wilmington, Del. He learned to fly in 1930 and was National Soaring champion in 1934, 1935 and 1937. He established a U.S. soaring distance record of 158 mi. in 1934 and a

U.S. altitude record of 7,200 ft. in 1938. As special assistant to Gen. Henry H. Arnold, chief of the U.S. air forces, he was sent on a mission to Sicily in 1943 to observe glider forces in operation. Less than a week after his return to the United States, he was killed in the crash of a glider at March field, Calif., Sept. 11.

Dyestuffs. The paramount task facing the organic chemicals industry in 1943 was no different from that of the previous year and consisted primarily of satisfying the greatly expanded demands of the army and navy. The War Production Board Conservation Order M-103 which was in effect from April 1, 1942 on proved its workability. Quotas were set quarterly and were determined by the supply of raw material available for the manufacture of dyestuffs. Military and civilian requirements were considered, and the production of specific dyes or groups of dyes was controlled and regulated to provide a regular flow of colouring material in sufficient quantities to satisfy essential needs. Order M-103 was revised on Oct. 23, increasing the sale and delivery of certain classes of dyes for civilian consumption from 15% to 17½% per calendar quarter. The augmented allotments for civilian use were made possible by smaller military requirements for certain types of dyes due to reduction in purchases of woollen and worsted fabrics. Export quotas were increased also from 15 to 17%. These were set up after a study of past shipments and potential demands and, unlike the American civilian quotas which were based on past use, the export quotas were based on production. They were applicable to friendly nations who were no longer able to obtain their supplies of dyestuffs from Europe and were dependent upon the United States.

The policy of the War Production board was to make available dyes of high quality and performance in order to maintain the standards of civilian war textiles as close as possible to the desirable properties of fabrics processed during peace. The shortage of fibres of different kinds compelled the textile manufacturers to use their ingenuity in developing fabrics from available materials. Old-staple fibres were blended with newer synthetics and the resulting mixtures presented technical problems in colour application. Scientific research in the further development of dyes and dyeing processes to colour these complex textiles was actively carried out in the laboratories of dyestuff manufacturers. High-speed methods were developed which had previously been thought impossible. An outstanding contribution by dyestuffs technicians was a procedure for the continuous dyeing of indigo on navy wool flannel, effecting savings in time and operating cost.

Production of coal-tar dyestuffs in 1942 amounted to 151,878,000 lb., which was 17,000,000 lb. less than the peak output for 1941. Sales were 144,847,000 lb., and valued at $99,431,000. Vat-colour production, exclusive of indigo, was 27,432,000 lb., 3% higher than in 1941, and accounted for a slightly larger portion of the 1942 production, although, in general, little change occurred in the relative importance of the dyes by class of application. The principal colours manufactured were vat, direct, sulphur and acid, which accounted for approximately 78% of the total. The quantity of unclassified dyes listed by the U.S. tariff commission, including the more important military dyes, increased by 2,600,000 lb. and that of the classified dyes decreased by 19,000,000 lb. Figures for 1943 production and sales were not available.

(A. G. BN.)

EAC: *see* EUROPEAN ADVISORY COMMISSION.

Eaker, Ira C. (1896–), U.S. army air officer, was born April 13 in Field Creek, Tex. He studied at the University of the Philippines, Columbia and Southern California universities and was commissioned as second lieutenant in the infantry reserve in 1917. Transferred to the Philippines in 1919, he served in the air corps and later was given command of the Manila air depot. In 1929, he was co-pilot in an army plane which established an endurance flight record of 150 hr. and 40 min., and some years later he made a cross-continent "blind flight." He served as executive officer in the air corps headquarters in Washington, 1937–40, and by Jan. 1942, he had become a brigadier general. He was made chief of the U.S. bomber command in the European theatre of war in the summer of 1942. Upon the transfer of Maj. Gen. Carl Spaatz to North Africa in Dec. 1942, Eaker succeeded him as commander of the 8th U.S. air force on Feb. 15, having been advanced to rank of major general. His force was doubled by summer and greatly increased again by October, when it had assumed full partnership with the R.A.F. in bombing the axis. Promoted to lieutenant general, Eaker stated in October that the task of the air force for the winter would be to destroy Germany's production and transportation facilities so that invasion could be carried out with fewer casualties. On Dec. 28, 1943, Gen. Eaker was appointed commander of all Allied air units in the Mediterranean theatre. He was succeeded as commander of the 8th air force by Maj. Gen. James H. Doolittle.

Ear, Nose and Throat, Diseases of. From the point of view of the otolaryngologist, it is imperative that a flier should possess normal nasal function, average ears and hearing, eustachian tubes and sinuses without obstruction, normal balancing mechanisms and no vertiginous episodes. He must be free of cold or acute respiratory infection.

On descent, most individuals can equalize the relative negative pressure of the middle ear pneumatic system through swallowing, yawning or making some movements of the lower jaw. If some obstruction is present in the eustachian tubes secondary to a pharyngitis or an acute head cold, aeration of the middle ear cavity is interfered with so that a cycle of events takes place that brings about aero-otitis media. When the negative pressure inside the middle ear reaches 100–120 mm. Hg (mercury), pain is severe and a moderate amount of hearing loss takes place in the low tone range. The drum membrane becomes sharply retracted, the blood vessels of the handle of the malleus are congested, later ecchymosis in the flaccid membrane develops, and after some hours, depending upon the differential negative pressure, serosanguineous fluid and bubbles form in the middle ear. The fluid elements in the middle ear cavity constitute a recovery cycle, as the relative negative pressure is reduced proportionately to the amount of fluid formed. In time, however, pressure is equalized. It takes from 3 days to 3 weeks for recovery from aero-otitis media; very few cases become infected, and politzerization and catheterization of the eustachian tubes when performed immediately is effective, though not so efficient as one would wish.

The best treatment is to return to the level at which block of the eustachian tube and middle ear cavity took place, either in actual flight or in a pressure chamber, and to descend to ground level slowly, swallowing frequently. In this manner, the pressure outside the drumhead and that of the air passing through the eustachian tube are altered simultaneously, whereas in catheterization and politzerization only that entering the eustachian tube is altered. If aero-otitis is present for a few days, heat

causes an increase in fluid production in the middle ear, analgesics relieve pain and a shrinking solution to the orifice of the eustachian tube mouths decongests the swollen mucosa. All of these measures afford considerable relief to the unbalanced state of affairs present. Opening of the drumhead (myringotomy) is best avoided.

Aerosinusitis is a similar cycle of events taking place in the accessory sinuses of the nose and has increased in frequency as greater altitudes and speeds of ascent have been achieved. On ascent, the pressure inside an obstructed sinus becomes greater than that outside with consequent expansion to the limit of the elasticity of its walls or structures. Pain results.

During descent, the opposite effect is present. Redundant tissue or polyps may then form a ball valve over an ostium, or pus flowing over an ostium can be drawn into a sinus which may have been empty and sterile. If the relative negative pressure inside a sinus becomes great enough, the mucous membrane may be torn away from its walls. Haemorrhage in the cavity or haematoma beneath the mucosa is not rare. The best treatment for aerosinusitis is to carry out the general suggestions outlined under the treatment for aero-otitis media, namely, to provide conditions for the equalization of pressure as quickly as possible as well as to relieve pain and discomfort.

Eastman, Joseph B. (1882–), U.S. government official, was born June 26 in Katonah, N.Y. He was graduated from Amherst college in 1904 and studied law at Boston university. He was appointed to the Interstate Commerce commission by President Wilson in 1919 and was reappointed by succeeding presidents until 1933, when he served as President Roosevelt's federal co-ordinator of transportation. During his 14-year tenure on the ICC, Eastman was considered a "government-ownership" man by many railroad presidents because he fought to lower freight rates and executive salaries. He denounced the unnecessary duplication of services and sought to outlaw dummy corporations and holding companies. In 1936, he returned to the ICC and in Dec. 1941, Mr. Eastman, then chairman, was appointed by President Roosevelt as director of the newly-established Office of Defense Transportation (ODT), designed to co-ordinate federal and private transportation policies. During 1942 and 1943, he curbed civilian use of motor cars, trucks, buses and trains in a variety of ways to save fuel and to make possible constantly increasing traffic in war materials.

Economic Development, Committee for: *see* COMMITTEE FOR ECONOMIC DEVELOPMENT.

Economics. Contributions to applied economics were more significant than to theoretical economics during 1943. In May about 675,000 man-days were lost through strikes because labour leaders questioned the validity of the War Labor board decision to restrict wage increases to the cost of living index of the bureau of labor statistics. They charged that it did not give proper weights to items in family wartime budgets, so an impartial committee of experts known as the Mills committee was set up to investigate and in October reported that the index "defined with satisfactory accuracy" the changes in living costs, and that it was the purpose of the index to measure changes in prices, not changes in standards of living, as labour leaders had urged. Had this index been found wanting the "little steel" formula used as a model for wage stabilization would have been abandoned and governmental price controls definitely endangered.

Sir John Maynard Keynes submitted a plan for a postwar international clearing union of the United Nations designed to stabilize foreign exchange based upon assigned "bancor" quotas for member countries. Under this plan, gold possessed only "great psychological value," although the clearing union would not dispense with it immediately but would supplant it eventually with credits for international settlements. Simultaneously, the federal treasury submitted the White plan for an international currency in "unitas," not dollars, designed to maintain stability with a gold stabilization fund. Preliminary conferences were held and both plans given widespread professional consideration pending the call of a conference of representatives of the United Nations to consider the problem of international monetary stability in the postwar period.

The Brookings institution published a brief appraisal of the theories underlying federal debts, unbalanced budgets, postwar deficits, employment and inflation. The conclusions were critical of prolonged deficits and continued spending. The Conference on Research in Income and Wealth of the National Bureau of Economic Research published significant findings on income size distributions within the United States, conceding that much statistical groundwork remained to be done.

Among government publications, perhaps the reports of the National Resources Planning board, submitted to congress by the president in March, required the most careful scrutiny. These reports recommended a postwar readjustment period with extended wartime controls to prevent booms and depressions; gradual demobilization of the armed forces co-ordinated with re-employment; guarantees of right to work, to fair pay and to an adequate living; enterprise free from arbitrary public and private authority; a cabinet post for social security, education and youth programs; maintenance of national income at a level of $125,000,000,000 annually; and higher income and lower consumption taxes. Among the most important fields of private research were those dealing with war contract termination problems, the government surplus disposal program, postwar re-employment, lend-lease, international settlements, removal of trade barriers, taxation and fiscal policy.

Graduate study and research in economics in the universities came almost to a standstill. Many courses emphasized contemporary and postwar problems. Some teachers were drawn into the armed services. Others entered civil service, holding strategic positions, and congress launched attacks against "Washington economists," primarily those whose academic training had been in the field of pure theory, or whose civil service classification designated them as "economic analyists" regardless of their lack of professional training. Research organizations, private industry and law firms added large numbers of professionally trained economists to their full-time staffs during the year. (E. H. HE.)

Economic Stabilization, Office of. The function of the Office of Economic Stabilization is to provide over-all direction and co-ordination for the government's program of stabilizing wages and living costs. The director is assisted by a board composed

of the heads of agencies concerned with price and wage control and representatives of labour, management and farmers appointed by the president. Because it is concerned primarily with policy-making, the Office of Economic Stabilization operates with a very small staff.

The office was established on Oct. 6, 1942, by executive order, with former Justice James E. Byrnes of the supreme court as director. On May 29, 1943, Mr. Byrnes resigned to become director of the Office of War Mobilization, and Fred M. Vinson, who had been associate justice of the federal court of appeals for the District of Columbia and chief judge of the emergency court of appeals, was appointed to succeed him. (F. M. V.)

Economic Warfare, Office of: *see* FOREIGN ECONOMIC ADMINISTRATION.

Ecuador. A Pacific coast republic of South America, located astride the equator. The area of Ecuador was claimed to be 337,392 sq.mi. (including the 2,400 sq.mi. of the Galápagos Islands) previous to the settlement of a boundary dispute with Peru in 1942. Pop. (1942 census): 3,085,871; of this figure 28% are estimated as white, 30% as Indian, 40% as mestizo. The capital is Quito (pop. 150,347); other cities are: Guayaquil (159,940); Cuenca (45,000); Riobamba (24,000); Latacunga (18,000); Loja (18,000). President in 1943: Dr. Carlos Arroyo del Río.

History.—During 1943 there was no change in Ecuadorian co-operation in inter-American policy. On March 26, publication of news on hemisphere defense or local military developments was prohibited. In May all communication with axis countries was terminated, and property of axis nationals was taken over by the government. All vessels of over 20 tons were placed under national control. On Feb. 23, arrangements were made whereby the United States was to purchase all Ecuadorian quinine available for export, and in June the same nation extended a $5,000,000 stabilization fund agreement for an additional year. In November the extraordinary powers which had been granted to the executive because of world conditions were continued in force until Aug. 1944.

Ecuadorian internal politics were marked by preparation for the 1944 presidential election. At least six candidates were reported as in the field in May, one of them being Former President Ibarra. In February several Liberal party candidates for congress were arrested on a charge of political conspiracy, and a minor revolt, in August, was easily suppressed.

In the economic field, conditions in Ecuador generally improved through the year, although a flour shortage occurred in May. Most serious was an increased cost of living, estimated as over 50% higher than in 1939. Price control was not altogether effective. Late in April, after the visit of Henry Wallace, the U.S. promised to send urgently needed locomotives and railway equipment, and a comprehensive social and sanitary improvement program was outlined. Defense construction at Salinas (90 mi. from Guayaquil) and in the Galápagos Islands by the United States gave employment, and demands for balsa and rubber, in addition to usual agricultural work, absorbed all available labour. The coffee, cacao and rice crops (the latter important in Ecuadorean domestic economy as the staple food of the masses) were all estimated as heavier than in 1942; sugar, and probably cotton, production was expected to be under the previous year. On Oct. 6, a National Bank of Provincial Development (capital: 100,000,000 sucres) was established with the purpose of furthering the agricultural program and other projects.

Platinum exports were prohibited in November.

Education.—The school system in 1941 had 3,140 primary schools, with 6,076 teachers and an enrolment of 248,905 pupils; 23 public secondary colleges, with 9,137 students; 12 vocational schools, with 1,288 students; 4 universities, with 1,755 enrolled. The 1943 budget allowance for education was 24,647,000 sucres (14% of the total).

Finance.—The monetary unit is the sucre, value in 1943 approximately 7 cents U.S. The ordinary budget for 1943 was balanced at 159,383,000 sucres (1942: 119,567,000 sucres). The 1944 budget was set at 198,260,000 sucres. The circulating medium totalled 437,592,502 sucres in April 1943. The public debt in 1941 was 47,062,645 sucres.

Trade and Communication.—Foreign trade in 1942 was valued at 498,405,000 sucres (exports: 298,690,000 sucres; imports: 199,715,000 sucres). The United States normally leads in Ecuadorian trade (Ecuador's favourable trade balance in Sept. 1943, was $5,759,000). In at least one month in 1943 (April), Argentina supplied more goods to Ecuador than the United States.

Major Exports of Ecuador, 1942 and 1941

Product	Value, 1942	Value, 1941
Rice	59,214,841 sucres	24,041,646 sucres
Cacao	40,326,409	34,364,452
Rubber	35,481,212	6,978,249
Panama hats	22,121,127	16,230,669
Balsa	25,613,454	8,638,814
Coffee	17,277,646	23,827,134
Tagua	7,042,289	6,120,478
Hides and skins	3,886,330	3,563,233
Bananas	3,106,860	4,658,297
Mineral concentrates	25,374,413	29,425,725
Crude petroleum	24,820,362	13,425,462
Copper and lead	13,492,992	17,658,510

The principal manufacturing industry is in textiles, with approximately 20 cotton mills in operation in 1941, with 3,500 employees, and 10 mills producing other textiles.

External communication is by sea and air; nearly all traffic is through Guayaquil. Ecuador possesses about 600 mi. of railways, and 4,231 mi. of highway, of which approximately one-sixth is paved. The highway appropriation for the fiscal year ending March 30, 1943, was for 7,140,000 sucres, with half to be spent on new construction. Domestic airlines and the Guayas river afford additional means of communication. (*See* also HISPANIC AMERICA AND WORLD WAR II.) (D. RD.)

Eden, (Robert) Anthony (1897–), British statesman, was born June 12 and was educated at Eton and at Christ Church, Oxford. After service in World War I from 1915 to 1918, he contested the Spennymoor division of Durham in 1922, and in the following year he was elected for Warwick and Leamington, which he thereafter continued to represent. He was lord privy seal and a privy councillor, 1934, and in 1935 he entered the cabinet as minister without portfolio for League of Nations Affairs, holding this post until the following December, when he became foreign minister. Disagreement with Prime Minister Chamberlain over the latter's policy of "appeasing" Germany and Italy led to his resignation Feb. 20, 1938. Upon the outbreak of war Sept. 3, 1939, he re-entered Chamberlain's cabinet as dominions secretary. On May 11, 1940, he was named secretary of state for war in Churchill's cabinet, and on Dec. 23, 1940, he was appointed to the foreign ministry again.

On Nov. 22, 1942, Eden replaced Sir Stafford Cripps as leader of the house of commons, although he still retained his post as foreign secretary. During 1943 he participated in a number of international conferences, notably the parleys with Stalin at Moscow and Tehran and the Cairo conferences with Chiang Kai-shek and President Ismet Inönü of Turkey.

Education. The chief issues which occupied the attention of educators in the United States in 1943 were the

continued and mounting shortage of teachers, the large number of boys and girls who, lured by wage-earning opportunities, left school without completing their courses, and the problem of providing financial support for education. At the level of higher education the difficulties of adjusting the relations between the colleges and the armed services were removed but a new issue, the future of the college curriculum, arose. Finally, active attention was devoted to the problem of training men and women when hostilities cease.

The Shortage of Teachers.—The shortage of teachers, which had already begun to make itself felt in 1942, increased during 1943, when it was estimated that more than 100,000 teachers had left the profession to join the armed forces or to enter defense industries. It was anticipated that this number would continue to grow, particularly since steps were not taken immediately to adjust teachers' salaries to the increasing cost of living. With 40% of the teachers receiving less than $1,200 a year and 8% less than $600 a year, the temptation to enter well-paid positions in defense industries could not be resisted. The exodus of teachers was in the main from rural and village schools; teachers who left the urban schools were chiefly those whose special training was needed in defense industries and by the armed forces. The effect on all schools—rural and urban—was serious. In rural schools it was estimated that about 6,000,000 pupils would be taught by inexperienced teachers, assuming that the schools were opened at all. In urban schools serious difficulties were encountered in replacing teachers of mathematics, chemistry, physics and industrial and physical education. The War Manpower commission, as a result of pressure brought to bear upon it by school officials and educational associations, declared teaching an essential occupation and sought, under its stabilization plan, to regulate the transfer of teachers from one position to another for increased pay. Nevertheless, the turnover of teachers was nearly double that in any normal year (189,000 as contrasted with 95,000).

In an effort to check the migration from the profession a variety of schemes was tried. Attention was directed to the importance of education in a democracy; parent-teacher associations conducted publicity campaigns among the public and among teachers; promises of better conditions of service, tenure and old-age security were made; promising candidates were encouraged to enter the profession; and emergency training courses were established for inexperienced teachers or for those who had been out of the profession for some time and wished to help during the emergency. In many localities the services of citizens were secured to give part-time instruction in such subjects as music, art and physical education. Courses were also offered to experienced teachers who were ready to change from their own fields of specialization to those in which there were serious shortages. Many of the teacher-training institutions offered accelerated courses to meet the situation. Among the methods of publicity employed to recruit teachers were such pamphlets as that issued by the Michigan state department of education under the title "Should I Consider Teaching? Is It the Career for Me?" or such posters as that distributed to the high schools in Washington, "You Are Needed to Teach." In one field—physical education—a national committee on meeting teacher shortage in wartime physical education was formed.

To meet the emergency created by the teacher shortage President Roosevelt submitted a proposal to congress to provide a fund of $3,900,000 to assist colleges and universities, including junior colleges and normal schools, in offering short training courses for rural- and elementary-school teachers and teachers of vocational subjects, physical science, mathematics and such other subjects as might be essential to meet wartime needs as determined by the chairman of the War Manpower commission. (See *Journal of the National Education Association* and *Education for Victory*, bi-weekly of the U.S. office of education.)

The Exodus from School.—It was estimated by the middle of 1943 that 2,000,000 boys and girls between the ages of 14 and 18 had left school to enter wage-earning occupations, and that of these 25% were under 15. This was a consequence of the labour shortage and the high wages which could be earned after a very short period of training. To some extent the disruption of school organization through the shortage of teachers and lax enforcement of compulsory attendance laws may have exercised some influence. The situation became sufficiently serious for the War Manpower commission, the children's bureau of the department of labour, and the U.S. office of education to issue an announcement to urban communities stating that "The first obligation of school youth is to take advantage of their educational opportunities in order that they may be prepared for citizenship and for service to the Nation. . . . School authorities, employers, parents and other interested groups should recognize the obligation to safeguard the physical and intellectual development of youth." The educational policies commission of the National Education association issued a similar recommendation: "School attendance until graduation is the best contribution to the war effort which school-age youth can make." Both groups urged that arrangements be made to combine part-time work in war occupations with the continuation of regular schooling until high-school graduation. Not only was the academic education of youth being sabotaged but young workers were being exploited and were not being paid the "wages paid to adult workers for similar job performances"—the policy of the War Manpower commission. (See *Education for Victory*, official bi-weekly of the U.S. office of education, especially the issue for Sept. 15, 1943.)

Juvenile Delinquency.—The increase in juvenile delinquency which was noted during the year was found among wage-earning adolescents as well as among younger children who were left without supervision when their mothers entered defense industries. The increase of 10% in juvenile delinquency in 1941 grew to 25% or more in 1942 and continued to grow in 1943, creating serious problems for child-care agencies, educational institutions and juvenile courts.

Schoolwork and the War.—The work of the elementary schools was not seriously affected by the course of the war. Such adjustments as were necessary were made. Largely through the efforts of a number of educators working in co-operation with the Civil Aeronautics administration, courses and textbooks dealing with aviation were made available as part of a program to make children air conscious.

In the high schools a definite shift of emphasis was noted from the humanities, especially foreign languages, to such subjects as mathematics, physics, chemistry, flight aviation, physical education and vocational education. This was due in part to the introduction of preinduction courses, prepared by the preinduction training section, headquarters services of supply of the war department and the U.S. office of education. Outlines and textbooks were provided in electricity, radio, shopwork, machines and automotive mechanics. In some schools courses on postwar planning were introduced. The general trend to practical or wartime subjects stimulated teachers and organizations interested in foreign languages to engage in active campaigns to maintain and encourage their study.

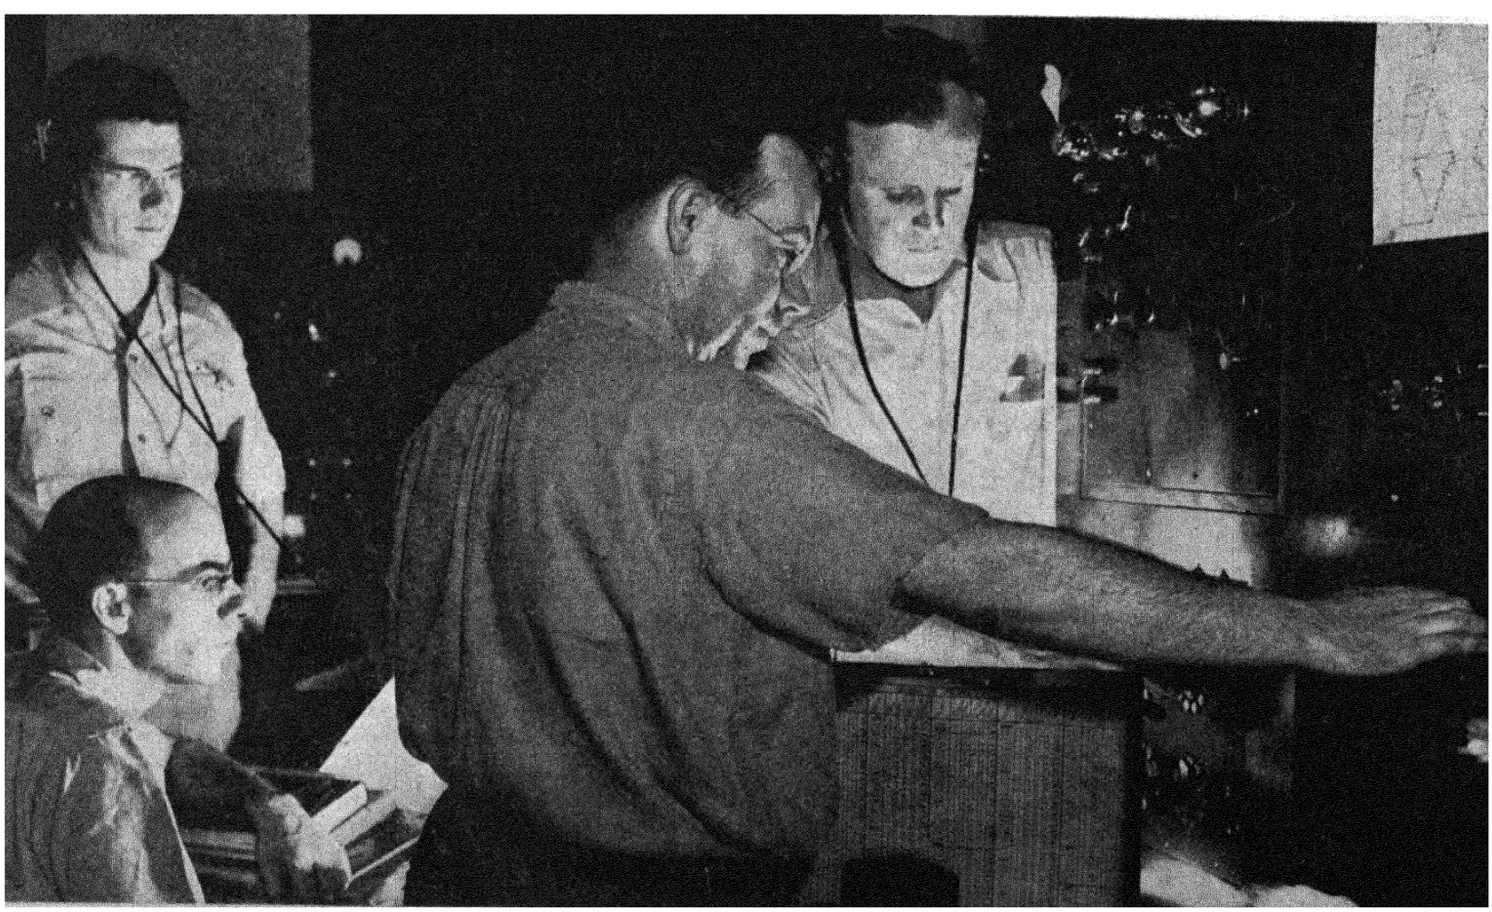
The chief emphasis at the high-school level was on vocational training. The enrolments in federally aided vocational schools and classes showed an increase from 2,434,641 in 1942 to 2,630,097 in 1943, distributed in vocational agriculture, trade and industrial, home economics and distributive education classes.

The Study of United States History.—The New York *Times*,

which in 1942 had published the results of an investigation into the place of the history of the United States in high schools, carried the investigation further, into the college. Considerable interest and controversy were aroused when the results of a test in the subject, given to 7,000 students in 36 colleges and universities, were published. The report of the survey seemed to point to neglect of the subject and a great amount of ignorance of American history among college students. The challenge was taken up throughout the country; by some the test itself was criticized from the technical point of view; others alleged that the students had not taken the test seriously; others, again, attributed their failure to show an adequate knowledge to the gradual substitution of "social studies" for the study of history in high schools.

The senate committee on education and labour discussed the report of the survey and considered a proposal to promote the study of American history in schools and colleges by means of federal aid. The New York *Times* report of the survey was ordered by the senate to be published as a senate document. The subject was one which was definitely included in the army and navy courses given in colleges under the scheme adopted for training of army and navy personnel, and it was urged that the subject be included in the high-school victory courses sponsored by the U.S. office of education.

The American Legion at its annual meeting passed a resolution stressing the importance of the teaching of United States history. In Illinois a law was enacted requiring publicly supported institutions of education to teach American history and the principles of American government. Similar action was proposed in other states.



Nor was the challenge ignored by professional organizations more closely concerned with the status of the teaching of history in schools and colleges. The American Historical association, the Mississippi Historical association, and the National Council for the Social Studies appointed a committee to undertake a comprehensive survey to promote the improvement of the teaching of history, to investigate both the teaching and textbooks in the subject and to investigate the number of pupils in elementary and high schools who study the subject. The committee, of which Prof. Edgar B. Wesley of the University of Minnesota is chairman, was expected to publish the results of its survey early in 1944.

Civil Liberties and Salute to the Flag.—The litigation arising from the refusal of parents belonging to Jehovah's Witnesses to allow their children to salute the flag in school exercises, which had resulted in their prosecution, finally reached the supreme court. In a significant decision the court ruled that children whose parents are opposed to the practice of salute to the flag in schools cannot be compelled to participate in the exercise as a condition of attending a public school. The decision was widely approved as a guarantee of civil liberties and as an illustration of continued respect for the Bill of Rights even in time of war and of the sincerity of American faith in the "Four Freedoms."

Higher Education.—The specialized training programs for army and navy personnel were launched in the spring of the year in some 500 colleges and universities of the country. The institutions were approved after inspection and received contracts to carry out the programs which they were best equipped to give. The programs for specialized training covered the following types of activities: engineers, aviation cadets, WACs, basic training, personnel psychology, area and language training, premedical and medical training, dental training, veterinary medicine, meteorology, chemical warfare, etc., in accordance with the needs of the army and navy respectively.

The selection of suitable candidates for admission to the colleges and universities for the specialized courses of training was carried out by classification and unit personnel officers, following

STUDENTS in a class in communications at Duke university, offered in collaboration with the U.S. Office of Education's program for college training of war workers. The 1943 program included World War II veterans discharged from the army

uniform standards and procedures adopted for the whole country. In the case of the army specialized training program (ASTP) enlisted men were assigned to the selected institutions as privates and were provided with free quarters, mess, clothing, equipment and instruction. All were required to follow a basic program in English and history, mathematics, physics and chemistry, after which they might be recommended for admission to officer candidate schools, or for immediate service with combat troops or for participation in an advanced program in accordance with their special aptitudes. A corresponding program was developed for the training of naval personnel. While the objectives to be attained were formulated by the army and navy authorities, the methods of attaining them were left to each institution.

During the year the army specialized training reserve program was introduced, under which qualified 17-year-old men could receive academic instruction preparatory to army specialized training. For this program 17-year-old high-school graduates were required to take a test administered jointly by the army and navy. If selected they pursued three 12-week courses in English, geography, history, sciences and mathematics. They enjoyed an inactive status and were not in uniform but received instruction, room and board and medical service. At the end of the term in which they became 18 they were placed on active military duty and sent to army training centres for military training, on completion of which a further selection took place for continuation in the army specialized training program.

Although the uncertainties about the immediate future of institutions of higher education were removed by the settlement of the status of selectees, enrolments in general inevitably showed a decrease. In the men's colleges the undergraduates were either below the draft age or in deferred occupations, or else were deferred, together with graduate students, under a liberal policy of the Selective Service bureau, if they were engaged in preprofessional or professional studies, agriculture, forestry, pharmacy, optometry or as internes. Deferment was granted in this way in some 20 scientific and specialized fields to full-time students, if the institution attended certified to their competence and promise of completing their studies successfully by July 1, 1945.

Statistics of enrolment for the academic year beginning in the fall of 1943 were not available for the whole country, chiefly because the academic year was completely disrupted. Reports from 497 institutions showed that there had been a decrease in enrolments of 11.6% among men and 3.5% among women during the year. Colleges now admit students at different times of the year and those which were on a semester basis fell into line with the army or navy programs and adopted 4 terms of 12 weeks each. It seemed not improbable that the accelerated programs adopted practically throughout the country might remain permanent, provided that the necessary adjustments could be made for faculty members and means of support could be found for students who in the past had earned money for their education during the long vacations. "Class" lines as such began to disappear and commencements were held at different times of the year.

So far as aid to students was concerned the possibility of restoring the system administered by the National Youth administration, which was abandoned when congress refused its request for a new appropriation, was suggested as a permanent policy of the federal government. The work of the National Youth administration was referred to as a "most acceptable experience," which combined both work and education as a condition of student aid. The national examinations given under the joint auspices of the army and navy would serve as a guide to the selection of promising high-school students for aid to assist them in continuing their education in college.

The Future of Higher Education.—The future of the liberal arts college occupied the attention of many educators. The shortage of specialists for war needs directed attention to certain defects which would require correction. The shortage of language specialists stimulated experiments in the teaching of languages. The whole approach was broadened to include not only the language but every cultural aspect of the country in which it is spoken; the methods and scope of the "language-area studies," as they have come to be known, would have an important influence on the teaching of all foreign languages. The report of the first year of the experiment, published by the American Council of Learned Societies, testified to its success in the teaching not only of the languages usually taught in schools and colleges but in a vast array of the lesser-known languages.

The emphasis placed by the army and navy specialized programs on technical and scientific studies aroused great concern about the future of the humanities. At the beginning of the year Wendell Willkie, in an address at Duke university on "Freedom and the Liberal Arts," directed attention to the seriousness of the situation. The American Council of Learned Societies and some of the educational foundations organized discussions and research into the future of the humanities and of the liberal arts in general. The Association of American Colleges published an important report of its committee on "The Restatement of the Nature and Aims of Liberal Education." The report recommended a program of liberal education adapted to the needs of the modern world, in which enduring human values would be definitely included. Among other matters the report suggested more flexible methods of admission to college, particularly for demobilized members of the armed forces, more individual instruction and less lecture methods, reform of examination procedures and effective guidance of students.

In addition to many articles in general and professional journals a number of books began to appear on the subject of the college and school curriculum. Among these were Robert M. Hutchins' *Education for Freedom* (Louisiana State University Press, Baton Rouge, La.), Jacques Maritain's *Education at the Crossroads* (Yale University Press, New Haven, Conn.) and Mark Van Doren's *Liberal Education* (Henry Holt and Company, New York).

Postwar Education of Service Men and Women.—Plans were developed during 1943 to provide for the postwar education of service men and women. These plans concerned two groups in particular: (1) the great majority of ex-service men who require short periods of training and (2) others, including those whose education was interrupted by the period of service and those specially qualified who could benefit by a more extended program of general, technical or professional education.

In October President Roosevelt sent a message on the subject to congress urging immediate planning and action so that service men and women might be demobilized into a sound and prosperous economy with a minimum of unemployment and dislocation and that with the assistance of the government they might be given an opportunity to find jobs for which they are fitted and trained, with special training and education for those who desire it. He urged federal assistance to make such training possible for such periods as were needed by individuals according to ability. The federal government would provide the necessary funds and supervise their expenditure under generally accepted standards, but the control of education and certification of trainees and students would be left to the states and localities. Special provision would be made for the rehabilitation of disabled veterans.

The president's address was based on the report of a committee appointed in 1942 and reporting in Aug. 1943. The committee distinguished between the two groups mentioned by the president. For those in the second group—those qualified for ad-

vanced and professional and technical education—the committee recommended selection on a competitive basis, and that the award of scholarships, carrying with them reasonable maintenance allowances, should be determined by the needs of technical and professional occupations in which shortages of adequately trained personnel exist. Scholarships should be tenable for a period not to exceed four years, their continuation depending on the academic and general progress of the students.

In a bill introduced by Senator Claude Pepper and intended to provide loans to personnel in the armed forces and to merchant seamen, provision was made to grant loans up to $4,800, the estimated cost of four years of education, including living expenses, tuition, books and supplies as well as living expenses for dependents. If the student "showed good faith and diligence in his or her work" on certificate from the institution attended, only half of the loan would have to be repaid at 1% interest and in 10 instalments, if necessary.

It was expected that some provision would also be made for the re-education of men and women working in war industries to equip them for the changed occupations in peacetime industries.

National Scholarships for Girls.—Seven women's colleges—Barnard, Bryn Mawr, Mount Holyoke, Radcliffe, Smith, Vassar and Wellesley—informally associated in the Seven College conference planned to award 21 scholarships to incoming freshmen. The plan, which was to go into effect in May, 1944, was intended to encourage students of exceptional promise to come to these colleges from distant parts of the country. A prize of $100 was to be awarded to each successful candidate with additional amounts on the basis of need, to cover the cost of tuition, board and room in whole or in part. Scholarships would be renewable for the full college course, if the winner maintained a high honour record. The executive secretary of the conference in 1943 was Mrs. F. Murray Forbes, Jr., 21 Beaver Pl., Boston. (For statistics of institutions *see* UNIVERSITIES AND COLLEGES.)

Federal Aid for Education.—The effort to secure federal aid for education, which began during World War I, was continued during 1943 but was again defeated. Since 1917 the need for federal aid to implement the American ideal of equality of educational opportunity was believed by some educators to be greater than ever. The war revealed the differences in educational provisions in the country as never before. Under the selective draft system large numbers of draftees were shown to be wholly or functionally illiterate, and another large number were rejected on physical grounds. The shortage of teachers revealed the low standards of remuneration which prevailed in the country.

In June 1943, the Thomas-Hill bill (S. 637) was approved by the senate committee on education and labour. The bill provided for the allocation of $200,000,000 a year to the states during the war "for payment of increased teachers' salaries and other unusual expenditures" arising out of the emergency, and a continuing postwar appropriation of $100,000,000 a year to be used for the equalization of opportunities among and within the states for public elementary and secondary education, including kindergarten and nursery schools and education through the 14th grade (*i.e.*, junior colleges).

The fund for emergency purposes was to be provided: (1) to keep schools open and to pay teachers' salaries; (2) to employ additional teachers in order to reduce the size of the larger classes; (3) to raise substandard salaries; and (4) to adjust salaries to meet the increased cost of living. The average number of pupils in average daily attendance was to be employed as the basis for distributing appropriations to the states.

The basis for the distribution of the equalization fund was to be the number of persons 5 to 17 years of age and the total income payments in each state; the larger amount of aid would under this formula go to the poorer states which had the larger number of children and the lower income payments.

The index of need in the states was, according to the bill, to be computed by the U.S. commissioner of education, in whom the administration of the bill's provisions was to be vested. The control of education was to be left to the state and local school authorities. The distribution of the federal funds was to be made by the state authority in each state. To prevent the use of federal funds to replace or reduce state funds for education each state would, according to the bill, be required to continue to spend as much for education as it had in 1941 in order to qualify for federal aid. A similar safeguard against the reduction or replacement of state or local funds by federal aid was provided in the special aid to be given to maintain schools for minority races on the basis of their proportion to the total population.

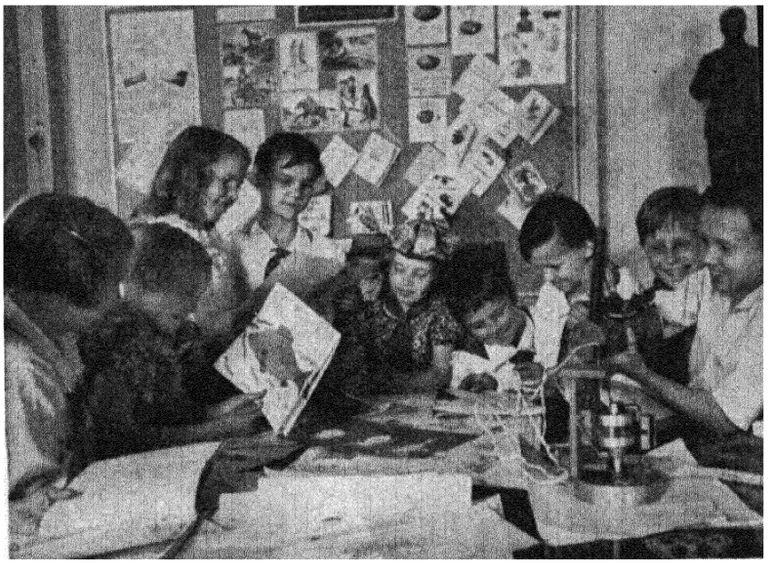
The bill came before the senate in October but was defeated on the following amendment: "Provided that there shall be no discrimination in the administration of the benefits and appropriations under the respective provisions of this act or in the state funds supplemented thereby on account of race, creed or color." The bill was referred back for further action to the senate committee on education and labour. The corresponding bill, H.R. 2849, was still scheduled to be discussed in the house of representatives.

In view of the continued need of labour, it was estimated that if care were provided for the children of working mothers, the number of women engaged in defense industries—about 18,000,000—could be increased. Under the Lanham act, 1942, provision had been made for the care of children and for other emergency needs. Funds had already been made available to the extent of $300,000,000 up to June 30, 1943, for the construction, maintenance and operation of community facilities, including schools. An additional amount of $200,000,000 was authorized by congress to be used until the War-area Child Care act of 1943 should become effective. Under the latter act the administration of provisions for the care of children was transferred from the Federal Works agency to the children's bureau and the U.S. office of education. Care was provided in 1943 for 320,000 children, of whom 60,000 were between the ages of two and five. Guidance in the organization of wartime child-care programs and state and local programs of child welfare, nursery schools and extended school services was given by the director of community war services of the Federal Security agency.

Educational Needs of the Future.—The National Resources Planning board in its recommendations outlined the financial needs of American education in the postwar era. On the basis of the total expenditures for education of $2,817,000,000 in 1940, the board recommended an expenditure of $6,100,000,000. Among the items to be included were the following: For preschools, elementary and high schools, $3,000,000,000; for junior colleges, $400,000,000; for colleges, universities, professional and technical institutions, $1,000,000,000; for adult education, $300,000,000; for student aid, $300,000,000; and for public libraries, $200,000,000. For the five-year period immediately following the war the board recommended an expenditure of $2,380,000,000 to eliminate building deficiencies in education (the cost in 1940 was $382,000,000).

The board included in its program of education increased attention to education for health and safety, vocational training, leisure education, education in home and family living, training for national security and citizenship, social and economic education, retraining of men and women demobilized from the armed forces and defense industries and provision of opportunities for those whose education had been interrupted by the war. In order to equalize the educational opportunities throughout the country

the board urged the provision of adequate funds by the federal government. The board also recommended that the functions of the U.S. office of education should be enlarged so that it might become "the major instrument in educational research and planning."



International Relations in Education.—Considerable attention was devoted during 1943, both in Great Britain and in the United States, to the future of education, the rehabilitation of education in Germany and to the creation of an international agency for education. In the United States the division of cultural relations of the state department and the Office of the Coordinator of Inter-American Affairs continued their activities in promoting relations between the United States and the republics of Latin America, and plans were considered by the former for the extension of its sphere of work to other parts of the world.

The third report of the Commission to Study the Organization of Peace, issued in Feb. 1943, contained a paper by I. L. Kandel on "Education and the Postwar Settlement" in which were discussed such topics as "Education an International Concern," "Need of an International Educational Organization," "The Pattern of Educational Reconstruction," "Educational and Intellectual Rehabilitation" and "International Centers for the Study of Education."

In May 1943, the educational policies commission of the National Education association issued a report on *Education and the People's Peace.* After reviewing the international status of education in the period between the two wars and the opportunity offered for correcting past mistakes the report urged: (1) the importance of developing public opinion in the United States on the issues of peace and international organization; (2) the necessity of creating a council of education for the United Nations; and (3) the need of a permanent international agency for education related to other parts of the emergent world organization. The function of an international agency for education would be "to keep constantly in touch with educational procedures throughout the world, and to report its findings publicly." (National Education Association, Washington, D.C.)

The Universities Committee on Post-War International Problems issued a pamphlet on *Education and World Peace,* prepared by members of the faculty and students of the graduate school of education, Harvard university. In this pamphlet the major problem indicated in the title was broken down into the more specific questions implicit in it, and the more important arguments for and against the principal current answers were formulated. Among the questions discussed were the following: the relation of education to world organization for international peace and order; the creation of a permanent international office of education; the establishment of an international university; and the formation of an international education association. (Published by the World Peace Foundation, Boston.)

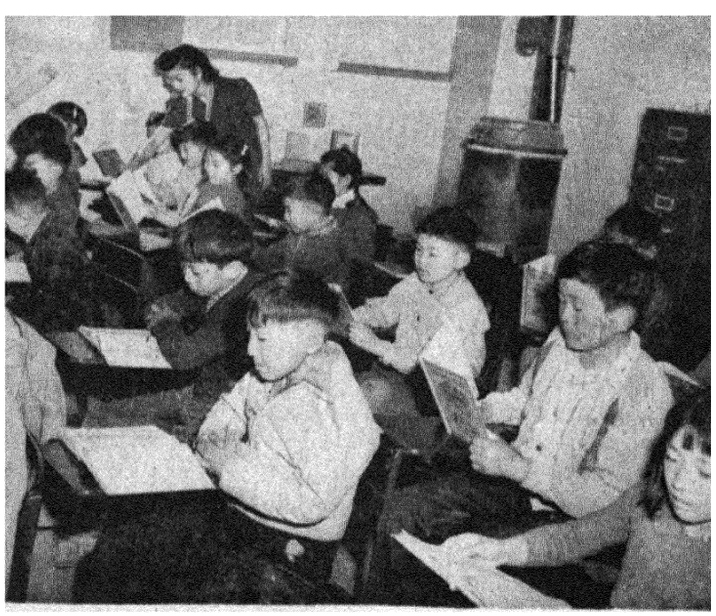
In September an international education assembly met at Harper's Ferry, Va., under the auspices of the Liaison Committee for International Education, which consists of representatives of various educational organizations in the United States. The assembly voted in favour of the establishment of an international commission for education to co-operate with governments in rebuilding educational and cultural programs in war-devastated countries, to assist new governments in axis countries in reconstructing their educational systems in harmony with peace aims, to eliminate educational and cultural activities that threaten peaceful relations among nations, to encourage the provision of equality of opportunity in education, to assist in the elimination of illiteracy and to encourage the establishment of international institutions for the training of educational and cultural leaders.

EXHIBITION OF RUSSIAN CHILDREN'S WORK at the Palace of Young Pioneers, Leningrad, in June 1943

The assembly unanimously voted for the establishment of an international education office.

In England the Joint Commission of the Council for Education in World Citizenship and the London International assembly issued a report on *Education and the United Nations* (reprinted by the American Council on Public Affairs, Washington, D.C.). The London International assembly is an unofficial assembly of members, lay and professional, representing all the United Nations, together with representatives of some of the Allied governments and ministries of education in London. The report dealt with the status of education in nazi-occupied countries and with the future of education in the enemy countries, especially Germany, and in the United Nations and proposed the establishment of an international authority for education. The report recommended that (1) since education would be one of the chief responsibilities of the United Nations, a United Nations bureau of educational reconstruction be established at once; (2) during the occupation of Germany education should be under the control of a high commissioner to insure that nazi and militarist influences are eradicated and to supervise the re-education of the German people; (3) an international organization of education be created as soon as practicable for the advancement of education and the promotion of education in world citizenship—such an organization to be one of the principal parts of any new international authority that might be established and to consist of representatives of governments, education authorities and associations of teachers, parents and students; and (4) in order to keep the United Nations united by a dominating motive to build a better world and to educate in principles of world citizenship educational facilities be extended, with financial aid if necessary, from the community of nations.

Education in the Occupied Countries.—An inter-Allied bureau was established in London to consider measures needed to restore the educational services in the occupied countries. The bureau was the result of conferences held by ministers of education of the governments-in-exile in co-operation with the president of the English board of education. The United States was represented at these conferences by an unofficial observer. The chairman of the bureau in 1943 was Jules Hoste, Belgian undersecretary for education. The bureau's work would include the purchase and distribution of books and periodicals, the preparation of films and other visual aids and the collection of scientific equipment. Plans for the financial support of education when re-established in the occupied countries were also the subject of discussion.



Soviet Union.—During the summer of 1943 it was announced

that coeducation, which had been introduced in the early years of the revolution, would be abolished in the secondary schools of the soviet union. The measure had already been proposed in 1940 but was delayed by the outbreak of war. The reasons put forward for the separation of boys and girls were that the needs of the two sexes were different and that each should be given that education which would best equip them for their future lifework. The emphasis in the education of boys would be on technical and military training and in that of girls on handicrafts, domestic science, hygiene and child care. Girls would continue to enjoy equal opportunities with boys to enter the universities.

Academic Freedom.—It is interesting to note that there were no cases during World War II of dismissal of academic personnel on charges of disloyalty. This is in striking contrast with the dismissal of a small number of professors for disloyalty at the outbreak of World War I, including the *cause célèbre* of the late Dr. James McKeen Cattell. The situation in 1941–43 was due in part to the hostile attitude already engendered against the nazis for their persecution of intellectuals and institutions of learning generally and against the Japanese for their insidious attack on Pearl Harbor. In part it was also due to the fact that strong professional organizations were developed after World War I for the protection of academic freedom.

The uncertainty of the future of colleges and universities after Pearl Harbor, when there was pressure for financial retrenchment in these institutions, created a feeling of insecurity among faculty members. The difficulties were overcome, however, by the absorption of specialists in public services and war industries, by the selective draft and enlistments and by the adoption of many institutions for the training of army and navy personnel. Although some institutions were compelled by circumstances to retire members of their staffs, the retirements did not constitute cases of violation of tenure principles.

In a report published in the February issue of the *Bulletin* of the American Association of University Professors, it was stated that 149 cases had been considered by its committee A on academic freedom and tenure in 1942. Of these, 80 had been closed at the end of that year. The majority of the cases concerned wrongful dismissals, violating the principles adopted by the association in 1915, 1925 and 1940 and reprinted in the February issue of the *Bulletin*. The December issue of the *Bulletin* of the association contained a list of 12 "censured administrations," that is, administrations of institutions "not observing the generally recognized principles of academic freedom and tenure, endorsed by this Association, the Association of American Colleges, the Association of American Law Schools, and the American Association of Teachers Colleges." CLASSROOM of Japanese evacuee school children at a U.S. relocation centre in 1943

Great Britain.—*Reform Proposals.*—On July 16, following more than two years' discussion and negotiation with parties concerned, the president of the board of education, R. A. Butler, presented to parliament a White Paper (*Educational Reconstruction*, Cmd. 6458) outlining the government's policy for postwar reform of the education service.

The changes proposed demanding legislation included a complete recasting of the public system of education, to comprise three successive stages—primary, secondary and further education; the laying of a statutory duty upon the local education authorities to secure "the provision of efficient education throughout those stages for all persons capable of profiting thereby"; the laying of a statutory duty upon the parent "to cause his child to receive efficient full-time education suitable to the child's age and aptitudes"; provision where needed of nursery schools for children below compulsory school age; raising of the age of compulsory full-time attendance at school from 14 to 15, and later to 16; institution of a system of compulsory part-time education for all young persons between leaving school and the age of 18; completion of the reorganization of the existing public elementary schools to make available well-designed and -equipped primary schools for all children up to the age of 11, and secondary schools with varied facilities for advanced work for all children over that age; provision of adequate and co-ordinated facilities for technical and adult education; expansion of the school medical service to include treatment as well as inspection and its extension to cover the system of part-time education; transformation of the power to provide meals, milk and other refreshment at school into a duty; the laying of a statutory duty upon all primary and secondary schools to begin each school day with a corporate act of worship and to give religious instruction; more complete maintenance and a 50% grant toward the cost of any required alterations of premises, on conditions, to managers or governors of voluntary schools; retention of county councils and county borough councils only as local education authorities, the county authorities to be assisted in their areas by district committees to which powers might be delegated if desired; and registration and inspection of private schools.

Administrative changes proposed included a progressive decrease in the size of classes in primary schools; abolition of the special place examination deciding entry to secondary schools; a common code of regulations for all secondary schools; remodelling of the secondary school curriculum; expansion of the Service of Youth; improvement of the facilities for enabling poor students to go to the universities; and reform of the methods of recruitment and training of teachers. The ultimate additional cost of the reforms was estimated at £67,400,000; and to ease the burden on local rates it was proposed to increase the aggregate exchequer grant from 49.36% to 55%.

The White Paper proposals as a whole were warmly welcomed by parliament, press and public, but several criticisms were widely made: The timetable for bringing the reforms into operation was considered dilatory, the financial allocation to technical and adult education too small. The total extinction of the smaller local education authorities was condemned. A definite date for the raising of the school age to 16 was demanded. The proposals concerning the voluntary schools and religious instruction were variously criticized along familiar lines.

After further consultations Mr. Butler introduced an education bill into parliament on Dec. 15. This included all the legislative

changes proposed in the White Paper, with some modifications in deference to public criticism. The timetable was speeded up and April 1, 1945, appointed for raising the school age to 15—a delay of two years being permitted if exceptional circumstances demanded. The age was further to be raised to 16 by order in council as soon as the minister deemed it practicable. The financial allocation to technical and adult education was more than trebled. The proposal for district committees was dropped in favour of one for "divisional executives" with statutorily delegated powers, while boroughs and urban district councils having populations of 60,000 or a school population of 7,000 were given the right to frame their own scheme of delegation. Some slight concessions were made to the voluntary bodies.

Important new proposals included the translation of the board of education into a ministry and the investing of the minister with appropriate powers (the old style and title being retained in both cases); and the setting up of two central advisory councils for education, one for England, the other for Wales and Monmouthshire, with the duty of taking the initiative in offering advice to the president. Eggs. The production of eggs in the United States in 1943 reached a new high record of nearly 5,000,000,000 dozen, more than the goal set for the year. This amount is about 50% above the average from 1933 on. After 1926 the total crop of eggs produced ranged from about 2,800,000,000 dozen to 3,220,000,000 dozen. The manner in which poultry raisers responded to the war need was much beyond the expectation of those who were planning the goals. While this high rate of production was not likely to be maintained in 1944 the surplus of 1943 was expected to go a great way to meet the large requirements for military, lend-lease and other special uses. There were about 32% more laying hens in farm flocks at the end of the year 1943 than the 10-year averages and also a large increase in the number of pullets not yet of laying age. This increase resulted from a heavy late hatch in the early summer. The factors that favored this heavy egg production were the high price of eggs and the large number of layers on farms. The total income from chickens and eggs in 1943 was estimated to total over $2,000,000,000, compared to $1,300,000,000 in 1942. This increase resulted from both higher prices and a larger volume of production. Cash income from poultry in 1943 was about 13% of total farm cash income, having increased more than the over-all livestock or crop production.

The goal for 1944 was set at the high total of 5,000,000,000 dozen eggs, but the shortage of feed in late 1943 threatened to reduce production sharply in some areas. A campaign to cull flocks 10% was proposed to save feed and the goals for poultry meat were reduced.

The demand for eggs for military, lend-lease and other uses continued to increase through 1943. Dried egg production was about 275,000,000 lb. in 1943 compared with 236,000,000 lb. in 1942. Egg-drying facilities were expanded several times after 1941 and could produce about 420,000,000 lb. annually if operated to full capacity at all times. Dried egg production increased rapidly during the first half of 1943 but slowed down later in the year when the prices of shell eggs rose in relation to eggs for drying. A total of 800,000,000 dozen eggs was estimated to be the total requirement for 1943 to meet the schedule of deliveries to war agencies. This was about 16% of United States egg production compared with less than 1% so used prior to 1941. All the dried product was reserved for government uses. (*See* also POULTRY.) (J. C. Ms.)

EGG POWDER on a packing line after dehydration

Egypt. An independent kingdom of northeast Africa; bounded N. by the Mediterranean, S. by the Anglo-Egyptian Sudan, N.E. by Palestine, E. by the Red sea, W. by Libya and the Sahara. Area *c.* 383,000 sq.mi. (arable land 13,600 sq.mi.); pop. (est. Dec. 31, 1939), 16,680,000. Chief towns (pop. 1937): Cairo (cap. 1,307,422); Alexandria (682,101); Port Said (126,907); Tanta (94,421); Mansura (68,637); Damanhur (61,791); Assuit (59,925). Ruler, King Farouk I; premier, Mustapha Pasha Nahas (Feb. 5, 1942); language, Arabic; religion, Mohammedan 91%; Copt 7%.

History.—The war receded from Egypt's borders as the Allied armies pursued and finally annihilated the German Afrika Korps. The Mediterranean ceased to be "closed" and at the end of the year convoys were beginning to arrive regularly from the west. Finally, domestic politics were unruffled by ministerial crises and Nahas Pasha remained firmly in power as prime minister. In the early summer the premier made some important changes in his cabinet, an outstanding new-comer being Amin Osman Pasha as minister of finance.

Egypt's economic problem was a serious government preoccupation throughout the year. Her position as the great war-entrepôt of the whole middle east brought money into the country where opportunities for sound investment were scanty. This led to ill-advised local speculation. At the same time, owing to the war shortage of shipping, the normal import of goods and commodities was so curtailed that supplies fell far short of public demand. The result was hoarding and black market speculation.

Amin Osman Pasha's program to control prices and check profiteering was only moderately successful. Energetic police action was taken sporadically against profiteers; but conditions in Egypt did not lend themselves to rationing control on normal lines, and by the end of the year the cost of living figure stood at 250%

above the 1939 index.

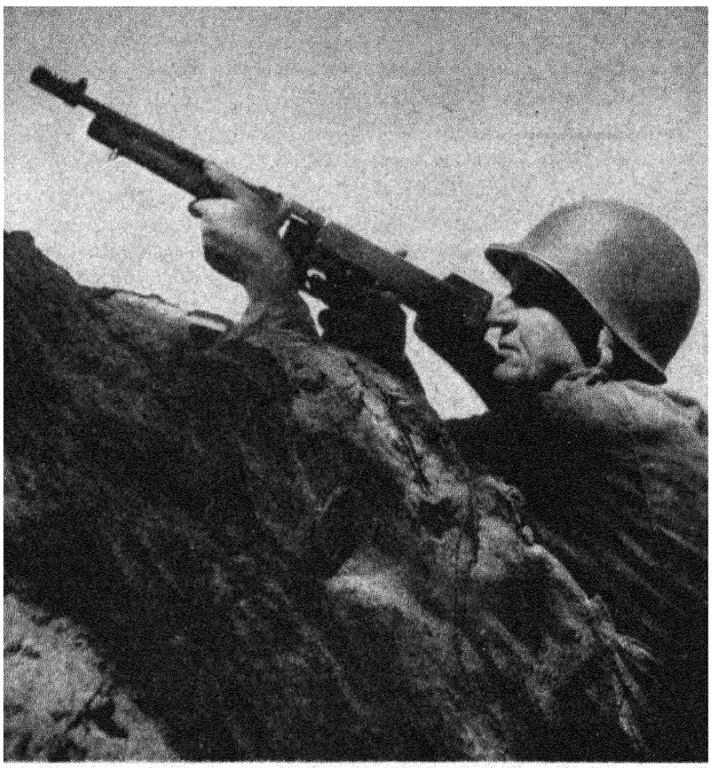
But the finance minister's handling of the problem of the surplus and idle accumulations of private money was an outstanding success. Between October and the end of the year the Egyptian government issued five loans—long and short—totalling about £E80,000,000. The public response was excellent and on each occasion the lists were closed as fully subscribed on the day of issue. The greater amount was to be applied as national loans to convert in Jan. 1944 the whole of the existing unified and preference loans which were long-standing international obligations on the country.

Simultaneously, to ease the local economic situation, the government maintained the previous restrictions on cotton cultivation so as to keep sufficient land for food production to meet the war shortage in wheat importations, etc. Again, to assist the agricultural population, and to prevent speculation in land, the rents of farms were frozen on the existing 1943 level.

During the year three historic war conferences were staged in Cairo. In January, Winston Churchill visited the middle east command in connection with the Allied operations in North Africa. In November, he and President Roosevelt and Generalissimo Chiang Kai-shek conferred on the far eastern campaign. In December, the president of the Turkish republic discussed the position of Turkey with the British prime minister and President Roosevelt.

In the summer, in response to an Egyptian appeal for funds to commemorate the El Alamein victory of Oct. 1942, upwards of £80,000 was subscribed by Egyptians of all grades. A sports club for British soldiers was opened in Cairo and steps were being taken to equip a rest hostel in England for the lasting benefit of troops of the British 8th army. In December a third daughter was born to King Farouk and Queen Farida. (O. M. T.)

Education.—(1938–39): Elementary and secondary schools 4,065; scholars 1,064,209; colleges 8; scholars 1,980; **Fuad I** university: scholars male 8,393; female 7,043; foreign schools (1936–37) 410; scholars 76,750.



Banking and Finance.—Revenue (est. 1942–43) £E53,526,000; expenditure (est. 1942–43) £E53,526,000; public debt (May 1, 1941) £E93,363,680; notes in circulation (Jan. 31, 1943) £E74,500,000; gold reserve (Jan. 31, 1943) £E6,300,000; foreign assets reserve £E76,400,000; exchange rate (£E1 = 100 piastres): (average 1942) £E1 = 413.8 cents; (May 1943) £E1 = 413.8 cents.

Trade and Communication.—External trade (merchandise): imports (1940) £E31,600,000; exports (1940) £E62,000,000. Communications and transport, 1938: roads, main 1,240 mi.; secondary 3,430 mi.; railways (1939), state 3,550 mi.; agricultural 879 mi.; shipping (1939) 110,000 tons gross; entered ports 35,390,325 tons gross; passed through Suez canal 25,827,977 tons gross; motor vehicles licensed (Dec. 31, 1938): cars 29,382; commercial 4,074; cycles 2,051; wireless receiving set licences (Dec. 31, 1938) 78,823; telephone instruments in use (April 30, 1938) 59,922.

Agriculture and Minerals.—Production (1940) (in short tons): cotton, ginned 454,148; maize 1,685,967; wheat 1,499,789; rice 727,298; petroleum 1,024,037; natural phosphates 201,721; cane sugar, refined 191,800; barley 265,765; ground-nuts 17,967. (*See* also ANGLO-EGYPTIAN SUDAN.)

LIEUT. GEN. ROBERT L. EICHELBERGER at a front-line gun position near Buna village, New Guinea, before Japan's total defeat there in the first week of Jan. 1943

Eichelberger, Robert Lawrence (1886–), U.S. army officer, was born March 9 in Urbana, Ohio. A graduate of West Point, he was commissioned a 2nd lieutenant in 1909, saw service on the Mexican border and the Panama Canal Zone and in 1918 was awarded the D.S.C. and D.S.M. while serving with the army of occupation in eastern Siberia. In addition, three decorations were bestowed upon him by the Japanese government. After World War I, he was stationed in the orient. On returning to the United States, Eichelberger was attached to the general staff for several years in the early 1920s. He returned to West Point, where he held the post of adjutant, 1931–35. He was then transferred to Washington, where he acted as secretary to the general staff in the years preceding the outbreak of World War II. In 1940, Eichelberger was re-assigned to West Point, where he streamlined the entire curriculum of training. During his 14 months as superintendent of the academy, he introduced an air training course which enabled cadets to qualify for commissions in the air force. Made a brigadier general in 1940, Eichelberger was promoted to the rank of major general in Oct. 1942, and in Jan. 1943, Gen. Douglas MacArthur revealed that Eichelberger had been placed in command of U.S. troops in Papua. For his participation in this campaign, he was awarded the distinguished service cross for the second time.

Eire. Eire is the southern portion of an island to the west of Great Britain, extending from 51° 26′ to 51° 21′ N., and from 5° 25′ to 10° 30′ W. Under the constitution, operative since Dec. 29, 1937, the name "Irish Free State" given by the treaty of 1921 to the 26 counties and four of the county boroughs of southern Ireland was replaced by that of "Eire," or Ireland. President: Dr. Douglas Hyde (*de h-Ide*). National flag: the tricolour of green, white and orange.

Area 26,601 sq.mi.; pop. (est. June 30, 1942) 2,963,000. Chief towns (pop. register 1941): Dublin (cap., 489,276); Cork (76,758); Limerick (42,522); Dun Laoghaire (41,924); Water-

ford (28,481). Languages: Irish and English; religion: Christian (Roman Catholic 93%).

History.—The chief interest of the year 1943 centred in the general election (June 22). In April the government introduced two bills to amend the electoral law. The General Election (emergency provisions) bill, which was passed, provided for the continuance in office of the existing Oireachtas until a new one had been elected. The Elections (Duration of Dáil Eireann) bill, which was withdrawn after second reading, provided for the extension of the life of future parliaments from five to six years.

External affairs played practically no part in the election campaign. In his speeches Eamon de Valera reiterated his assurance that since the agreement of 1938 the only problem outstanding between Eire and Great Britain was that of partition. William Cosgrave gave a special turn to the campaign by his promise, if given a majority, to form a "national government" representing all parties. This promise was ridiculed by de Valera, who referred to the proposed government as a "mixus-gatherum."

The result of the election was highly disappointing to both the principal parties. In the old Dáil, de Valera, with 77 deputies, had a majority of 16 over all other parties combined. The figures for the new Dáil were: Fianna Fáil, 67; Fine Gael, 32; Labour, 17; Farmers, 14; Independents, 8. Fianna Fáil had thus lost ten seats, but Fine Gael (Cosgrave's party) had gained no advantage, having itself fallen from 45 to 32, and having lost three of its leaders—General Richard James Mulcahy, Professor John Marcus O'Sullivan and John Costello. The chief surprise of the election was the re-emergence of the Farmer's party, which in the previous Dáil was virtually nonexistent. The new party was in effect a coalition between disparate groups, and its stability was by no means assured.

On July 1 de Valera was again elected Taoiseach by 67 votes to Cosgrave's 37, Labour and Farmers having abstained from voting. On July 2 he announced the names of his ministers; the only change was the addition of Seán Moylan as minister for lands. An election for the senate took place on Aug. 25 on a complicated and much-criticized system. Prominent new senators were General Mulcahy, Professor Fearon of Trinity college, Dublin, and Donal O'Sullivan, who was clerk of the senate abolished by de Valera in 1938.

In March the office of Ulster king-of-arms, created in 1552, was abolished, and its functions transferred to the National library. In England the Ulster title was added to that of the Norroy king-of-arms.

While efforts to make Eire self-sufficient in home-grown wheat had given satisfactory results, the 1943 harvest, largely because of wet weather, did not entirely come up to expectations. An increase in the compulsory tillage area and a rise in the price of wheat from 50*s*. to 55*s*. per barrel was announced for 1944. Owing to the growing shortage of pork and bacon, it was found necessary to discontinue the maximum price for live pigs.

(M. T.)

Education.—In 1940–41: elementary schools 5,076; scholars 462,245; secondary schools 352; scholars 38,713; universities, National, 4,039 students; Trinity college, Dublin, 1,391.

Banking and Finance.—Revenue, ordinary (1941–42) £36,980,000; expenditure, ordinary (1941–42) £40,625,000; revenue (est. 1942–43) £38,365,000; expenditure (est. 1942–43) £44,270,000; public debt (March 31, 1942) total, £55,684,675; notes in circulation (April 30, 1943) £29,200,000; reserve, gold (April 30, 1943) £2,601,685; securities reserve £20,600,000; exchange rate (Dec. 1943) £1 ≐ $4.035 U.S.

Trade and Communication.—Foreign trade (merchandise): imports (1942) £34,692,000; exports and re-exports (1942) £32,616,000; roads, main (1940–41) 10,000 mi.; secondary, 39,000 mi.; railways, total track mileage (1941) 2,492 mi.; shipping (1941): vessels 505; net tonnage 37,272; motor vehicles licensed (Aug. 1942): private cars 7,991; other vehicles 23,508; wireless receiving set licences (1940–41) 183,578; telephones, installations (1940–41) 27,870.

Agriculture, Manufacturing, Mineral Production.—Production (1941) in metric tons: oats 695,400; wheat 442,400; potatoes 3,748,600; barley 145,200; beet sugar 97,000; coal 155,000; wool 7,421. Livestock, number (June 1, 1940): cattle 4,023,027; sheep 3,070,588; pigs 1,049,089. Agriculture and fisheries, net output (1940–41) £55,048,000. Number of insured workers (1940–41) average 440,756; number of unemployed, average (1941) 74,656; (July 31, 1942) 55,000.

Eisenhower, Dwight D.

(1890–), U.S. army officer, was born Oct. 14 at Denison, Tex. He was admitted to West Point, graduating in 1915, and during World War I was an instructor at several U.S. army camps. After graduating from the Army War college, he served in the office of the chief of staff in Washington. In 1935, he went to the Philippines as Gen. MacArthur's chief of staff and helped plan the commonwealth's defenses. In June 1942, Gen. Eisenhower was given command of the newly established U.S. headquarters in England for the European theatre of operations and was promoted to the rank of lieutenant general. On Nov. 8, 1942, he led a huge force of U.S. troops which landed in French North Africa. He subsequently concluded a politico-military arrangement with Adm. Jean Darlan to join the Allied cause.

On Feb. 6, 1943, Eisenhower was named commander of all Allied forces in the North African theatre of war and was appointed to the rank of full general five days later. Under his command the Allied forces chased the axis armies out of Tunisia and on July 10, 1943, they invaded Sicily, completely overrunning the island by Aug. 17. Eisenhower then launched the invasion of Italy on Sept. 3. Five days later he announced the Italians' unconditional surrender. On Dec. 24, 1943, Pres. Roosevelt announced that Eisenhower had been named to command the Allied armies scheduled to invade western Europe in 1944. Several days later, Eisenhower predicted that Germany would be defeated completely sometime in 1944.

Elections.

The 1943, off-year elections, although few and scattered, were highly significant. As the first to be held since the United Nations began to achieve large-scale victories in North Africa, Italy the southwestern Pacific and in the skies over Germany, they furnished an index to the nation's mood under changing conditions and the people's response to new issues and problems born of the war. The Republicans scored heavily in all major tests. Their triumphs marked their greatest resurgence since their national and state crackup in 1934 and 1936.

In New York state the G.O.P. nominee for Lieutenant Governor, Joe R. Hanley, president of the state senate, defeated Lieutenant General William N. Haskell (retired) by a majority of 347,960. Hanley captured 55.2% of the total vote. Governor Thomas E. Dewey's lead over John J. Bennett, Jr. in 1942 was 630,000.

The American Labor party, which supported General Haskell, polled 324,550 ballots as against more than 400,000 when it nominated a separate candidate, Dean Alfange, in the 1942 gubernatorial contest; 288,508 of the A.L.P. ballots were cast in New York city.

The New York struggle commanded most interest for obvious reasons, including the fact that it is President Roosevelt's home state. Observers regarded the outcome as popular endorsement of Governor Dewey's ten-month-old administration at Albany.

It also meant that if Governor Dewey should leave the gubernatorial chair before the expiration of his term on January 1, 1947, the nation's greatest state would remain in Republican hands—a distinct political asset.

In New Jersey Walter E. Edge, former United States senator and Herbert Hoover's ambassador to France, won the governorship contest over Vincent J. Murphy, Democrat, by 128,008. Mr. Murphy was mayor of Newark and secretary of the state Federation of Labor. The percentage of the vote given the winner was 55.6. The Republicans retained control of the legislature by a heavy margin.

The surprise outcome occurred in normally Democratic Kentucky, where former Judge Simeon S. Willis, Republican, nosed out J. Lyter Donaldson, former highway commissioner, by 8,303 votes for governor, with a percentage total of 50.8. The Willis victory also contributed to the election of seven Republicans to important state offices. The Democrats held the legislature, but by reduced margins.

An unusual feature of this election was the fact that 4,180 more people went to the polls than in the regular 1942 contest. The increased vote was especially surprising in view of the fact that many young men had left the district to enter the armed services or to seek more lucrative employment in industrial centres. Save for a few small distilleries, the 4th district is strictly rural.

The Republicans also came out ahead in most of the mayoralty and township contests, regaining many cities which had been under Democratic rule for 10 and 15 years. Most notable struggle for city hall control was in Philadelphia, where Acting Mayor Bernard Samuel got a 63,339 majority over William C. Bullitt, former ambassador to Russia and France by appointment of Franklin D. Roosevelt.

The G.O.P. achieved an even more spectacular success in a special congressional election in the 4th Kentucky district, which had been a Democratic stronghold for years. On December 2, 1943, Chester O. Carrier, Republican, led his opponent, J. Dan Talbott, by 12,568. President Roosevelt carried this district by 10,000 in 1940, and Ed W. Creal, the Democratic incumbent whose death necessitated the election, won by 4,866 in November of 1942.

These results merely pointed up a trend which had been in effect for several years. The Republicans won or made the more impressive showing in every trial since the regular elections in 1942. In the 6th Missouri district Marion Bennett, Republican, was elected to the house by 62.9% of the vote in the spring of 1943. His late father got only 54.5% in November of 1942.

In the 2nd California district the Democratic candidate for a house vacancy was elected, but only because the opposition was divided. The two G.O.P. entries polled 60.3% of the total vote. In the 2nd Kansas district a special congressional election held on Sept. 4, 1943, gave Erret P. Scrivner, Republican, a percentage of 69.8 as against 59.2 for the G.O.P. winner in Nov. of 1942—the late U. S. Guyer.

The election results and deaths during 1943 changed the complexion of congress only slightly. At the opening of the session in Jan. 1943, there were 222 Democrats, 208 Republicans, 2 Farmer-Labor members, 1 American Labor representative, 1 Progressive and 1 vacancy. As the year closed, there were 218 Democrats, 208 Republicans, 2 Farmer-Laborites, 1 American Labor member, 1 Progressive and 5 vacancies.

In the senate the Republicans lost a seat through the death of W. Warren Barbour of New Jersey. By appointment of the then governor, Charles Edison, Arthur Walsh, a Democrat, took Mr. Barbour's place. Mr. Walsh was executive vice president of the Thomas A. Edison, Inc. industries, and formerly served as assistant administrator of the national housing administration. He must stand for election in Nov. of 1944.

The senate membership at the end of the year consisted of 58 Democrats, 37 Republicans and 1 Progressive, Robert Marion La Follette, Jr., of Wisconsin.

Other statistics reflect the extent of the Republican comeback that was climaxed on Nov. 2, 1943. The minority in 1943 had 26 governors in the 38 states outside the solid south; the comparative figure was 9 in 1936. The only governorship above the Mason and Dixon line and east of the Mississippi river held by the Democrats was in Indiana.

In those same 38 commonwealths the Republicans controlled both houses in 28 legislatures, the Democrats dominated 8 in the same manner and 2 were split. The 26 states where G.O.P. adherents sat in the gubernatorial chair in 1943 had a population of 85,000,000 and 339 votes in the electoral college.

Since all the victorious and defeated candidates in the 1943 contests urged full support of the war effort, that issue was not directly involved. Republicans argued, however, and many Democrats agreed, that the outcome registered popular dissatisfaction with the administration's handling of the home front.

The G.O.P. spokesmen also noted that Senate Majority Leader Alben W. Barkley, in campaigning for Mr. Donaldson in Kentucky, declared that a vote for Mr. Willis amounted to a repudiation of the president. Mr. Roosevelt journeyed to Hyde Park to cast his ballot for General Haskell, an old friend, and wrote a letter praising another old acquaintance, Mr. Bullitt, during the Philadelphia mayoralty fight.

Irritations and pressures associated with the global conflict were generally regarded as basic factors for the Democratic defeats. The electorate apparently manifested its discontent over heavier taxes, rationing of food, gasoline and other necessities, shortages of commodities, discomforts and inconveniences burdening their daily lives, conflicting rulings by the "bureaucrats," the administration's handling of labour and strikes.

The elections were held in the midst of clashes involving President Roosevelt's aides, War Mobilization Director James F. Byrnes and Economic Adviser Fred M. Vinson, the farmers and powerful labour groups. The people went to the polls at a time when the administration was insisting on subsidies to hold down food costs, while the agricultural bloc on Capitol hill was demanding price increases.

Wage disputes affecting 1,000,000 nonoperating railroad workers and 600,000 members of the United Mine Workers were still unsolved on election day, with Byrnes and Vinson maintaining that acquiescence to the demands of all these groups would precipitate inflation.

As the party in power, the Democrats naturally felt the full impact of this accumulation of grievances.

Ballot-box statistics also indicated that many influential elements once loyal to the New Deal turned against it on Nov. 2, 1943. These included farmers, organized and unorganized labour, the white-collar class, small business men, harassed housewives and the Negro vote.

There was distinct evidence that the Negro vote, traditionally Republican, deserted the Democrats. Republican candidates swept wards in New York city's Harlem, in Philadelphia and in Louisville where the Negroes had been returning Democratic candidates for more than a decade. Negro leaders attributed the defection to alleged Army-Navy discrimination against members of their race.

Historically, the administration suffered the normal vicissitudes which befall a party that has been in power for long. Assuming that Samuel J. Tilden did defeat Rutherford B. Hayes in 1876, the only period since the Civil War when one party

enjoyed a four-term tenure was from 1897 to 1913, encompassing the regimes of William McKinley, Theodore Roosevelt and William Howard Taft.

When President Roosevelt was asked for comment on the Nov. 2 returns, he replied that he was more interested in the news from the Solomon islands and the Italian battlefront. Wendell Willkie interpreted the results as a rebuke to Washington, but Governor Dewey said that the Republican victory in his state had no national import.

Postmaster General Frank C. Walker, who doubles as Democratic national chairman, attributed the outcome to local conditions and prejudices. Harrison E. Spangler, the Republican national chairman, said: "The Republican party is now the resurgent, dominant, victorious party of the United States. It is a unified party looking to the future." (R. Tu.)

Electrical Industries. In the United States, electrical manufacturing, which in the previous year had increased its production by 50%, in 1943 increased another third and its index of production stood at 553, based upon 1925 equaling 100. It was estimated that the value of the output stood somewhere close to $10,000,000,000.

Using the same basing period, the federal reserve board index of production for all manufacturing reached in 1943 the record height of 267. This affords a measure of comparison for the electrical manufacturing industry performance.

The great increase naturally came in industrial equipment, the index for which reached a high of 636. Production of civilian equipment, on the other hand, reached almost the vanishing point, standing at index 9 for electrical appliances.

The production figures are further indication of the fact that the preparation for war production was coming to a close. Equipment for transmitting and distributing electricity, for instance, was down to index 167 from a high in 1942 of 213. Insulated wire and cable, which is some measure of non-utility construction, was off from index 155 to 129.

The manufacturing production continued to expand during the year despite the fact that new orders were around 5% below those for 1942. Backlog figures were not available but they were down and, with further war order cutbacks, should melt very fast.

Because so much of the industry produced for war, virtually the same products as for peace, there was not a large reconversion problem. The appliance manufacturers, which represent the bulk of the non-electrical war material production, expected to reconvert in less than six months at the outside, mostly less than three months, once labour and materials were made available.

The electric power industry was expected to have no reconversion problem. It didn't have to convert for war and therefore would not need to change back for peacetime operations. However, its operations showed the full impact of war.

In 1943, for the first time, the energy output exceeded 200,000,000,000 kw.hr., reaching the total of 221,000,000,000, an increase of 17%. The first 100,000,000,000 mark was passed in 1936. The first two war years combined (1942 and 1943) showed an increase of more than 50,000,000,000.

Approximately one-third (74,400,000,000) was produced from water power and the remainder (146,600,000,000) from fuel power. These percentages did not vary perceptibly from the previous year. Imports from Canada increased about 100,000,000 kw.hr., bringing the total for the year up to 1,540,000,000. This was about two-thirds greater than in the years when Canada was in the war but the U.S. was not—1940 and 1941—but was still a third less than 1939.

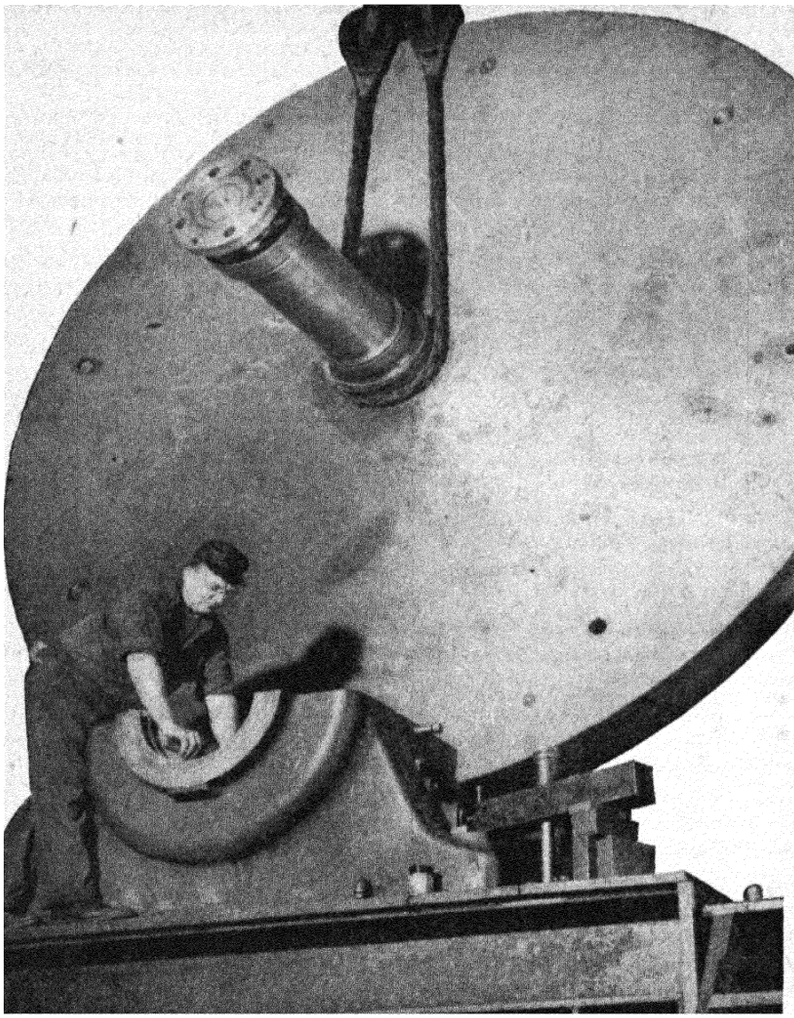
Output from publicly owned plants increased faster during the year than from private plants. In 1943, publicly owned plants accounted for 18% of the total generation, whereas in 1942 the percentage was but 15. The total output from federal and locally owned systems including rural co-operatives was 39,640,000,000 kw.hr. and for privately owned, 181,360,000,000. Federal participation in power production in 1933 was less than 500,000,000 kw.hr.; in 1943, it was in excess of 24,000,000,000. Local publicly owned generation was 15,300,000,000 kw.hr.

The load on the utility systems gained rapidly throughout the year, reaching an aggregate of non-coincident peaks in December of 37,130,000 kw., or 4,200,000 kw. more than in 1942. To meet this increased demand the utilities installed, in 1943, 2,900,000 kw. new generating capacity; nevertheless the net dependable reserve was reduced from 20.4% in 1942 to 14.7% in 1943. There was more than 7,000,000 kw. additional capacity available but because its availability was not assured 365 days in the year it was not included in the dependable capacity total.

Of the new capacity added in 1943, 1,100,000 kw. was hydro and 1,800,000 kw. was fuel power. Private companies were responsible for 1,700,000 kw. and municipal and federal for the other 1,200,000 kw.

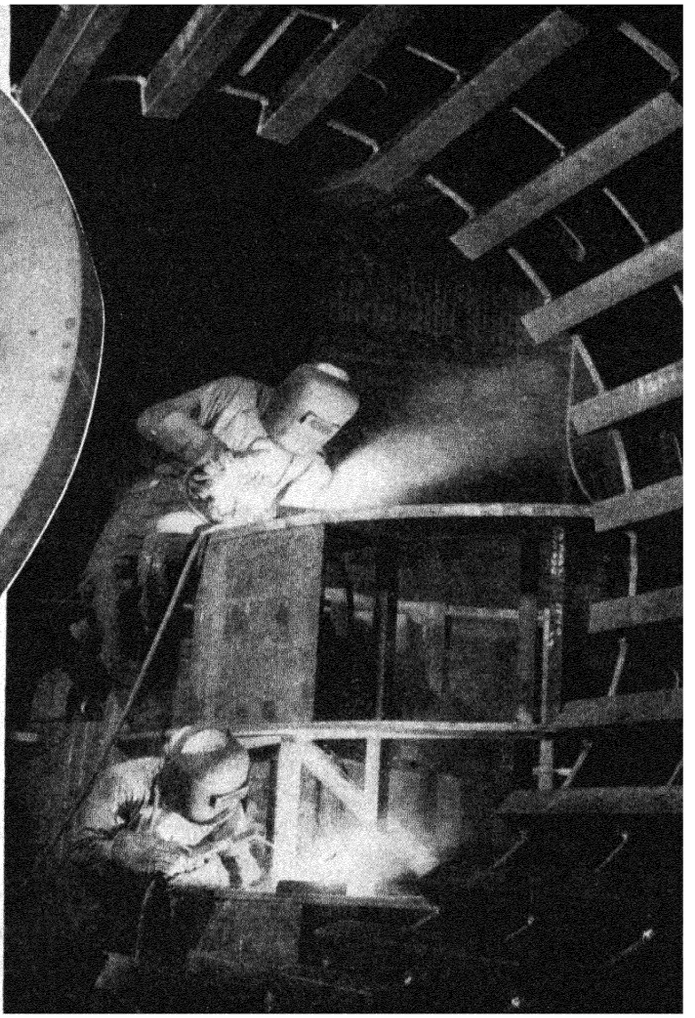
The amount of new generating capacity scheduled for addition in 1944 was approximately half of the 1943 additions, 1,465,900 kw and for 1945, 287,500 kw. The additions for 1944 reversed the order of capacity addition for the first time, with federal and municipal being larger than private companies by a small margin.

By the end of the year, power utility capacity had grown to almost 50,000,000 kw., the actual total being 49,442,000 kw. The increases in fuel and hydro capacity followed approximately the same pattern as the previous year. There was a marked change, however, in the percentage of ownership. Government bodies, federal and local, in 1943 owned 19.4% of all utility generating capacity, an increase from 17.5% in 1942. The increase of more than 1,000,000 kw. of federally owned capacity created the sharpest gain ever in this type of ownership.



Since the added generating capacity in itself was not sufficient to turn out the increased demand for energy, it was necessary to work existing equipment longer hours. The average hours use per kilowatt passed for the first time half the number of hours in the year with a performance of 4,611 hours. Fuel capacity passed 3,000 average hours use for the first time and hydro went to 5,483 or a use factor of nearly two-thirds.

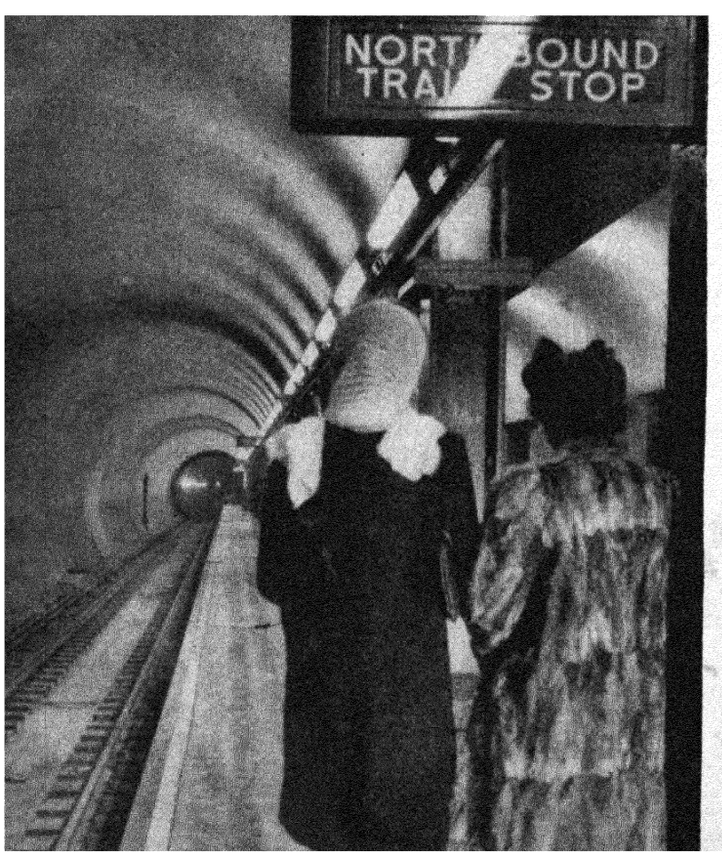
Coal consumed during 1943 amounted to 76,950,000 tons, oil to 15,280,000 bbl. and gas to 287,940,000,000 cu.ft. The oil consumption did not increase, but gas consumption was up 20% and coal 12.4%. For the first time the fuel efficiency of power generation was poorer. It was 1.34 lb. of coal per kw.hr. in 1943 against 1.31 lb. the previous year.



Fuel was a major problem in 1943. At the beginning of the year utility stock piles averaged 101 days supply. By the end of November this coal pile had dropped to 69 days.

Customer statistics showed the restrictive effect of war upon civilian economy. Fewer than 200,000 additional residential customers indicated the near cessation of home construction, while a loss of 80,000 commercial and industrial customers gave evidence of the inability to do business as usual. At the end of the year the total number of customers was 32,395,000.

These customers purchased a total of 186,000,000,000 kw.hr., with large light and power customers (industrials) exceeding for the first time a usage of over 100,000,000,000 kw.hr. Totals for the several groups were as follows: Rural, 2,875,000,000; residential, 28,775,000,000; small light and power, 29,100,000,000; large light and power, 106,050,000,000; electric railways, 4,675,000,000; street and highway lighting, 2,150,000,000; electrified rail-



FOURTEEN-FOOT FLYWHEEL, part of an electric motor-generator set built in 1943 for the Kaiser steel plant at Fontana, Calif. The manufacturers estimated that the flywheel contained "more than enough energy to yank the battleship 'North Carolina' a foot in the air in one second"

COPPER AND STEEL ROTOR, weighing 100 tons, for a 7,000 h.p. motor built in 1943 for a war plant. It contains more than 50,000 ft. of wire

roads, 2,575,000,000; municipal and miscellaneous, 9,800,000,000.

Although virtually no appliances were available all year, the residential usage increased from 1,012 to 1,073 kw.hr. in 1943.

In 1943, revenue passed the $3,000,000,000 mark for the first time, reaching a total of $3,096,600,000. With the exception of 1938, revenue increased from 1933 on, at approximately the same rate as during the '20s. Average revenue per residential kilowatt-hour continued its unbroken downward path to $3.64 in 1943.

Operating expenses, on the other hand, rose 12.1% resulting in an operating ratio before taxes of 40.3%. Taxes did not advance as sharply as in the two previous years but enough to take more than 25 cents out of every dollar of gross revenue.

Holding company divestments as the result of the operations of the Holding Company act numbered 32 in 1943, of which nine were sales to cities, PUD's (public utility districts) or rural co-ops. The remaining 70% remained in private ownership.

The fear that dismemberment of holding companies would result in many purchases by cities was not borne out. In fact, the whole public ownership program was quiet. In all, 12 elections were reported, the smallest number since the New Deal came in. Three were for and nine against municipal ownership.

There were few additional new REA lines because of material restriction but a number of farms along already built lines were connected, bringing the total consumers up to 1,080,000. Total energy input into REA systems exceeded 2,000,000,000 kw.hr. for the first time, 90% of which was purchased at an average cost of 8.5 mills per kw.hr.

To handle war regulation of utilities there was created within the War Production board the Office of War Utilities. Inventory control was tightened and exchange of excess stocks made mandatory. By the end of the year $25,000,000 in excess inventory had been distributed. As the year 1943 progressed, restrictions on materials were modified gradually.

War time was revoked in Michigan, Ohio and Georgia and on November 1 dimout regulations on Atlantic and Pacific coasts were cancelled. Because of coal shortages and transportation problems, a mandatory conservation program was scheduled for the middle of the year but was dropped in favour of a voluntary program which started on September 15.

Federal Power commission invoked the president's directive for supplying cheapest power to war loads over another's lines, known as the common carrier principle, against Washington Water Power in favour of Bonneville administration, but later, because loads were too small, withdrew the order. Renegotiation of power contracts was reported by the army to have returned $4,000,000 in the first fiscal year.

Rate reductions were numerous and those reported totaled about $6,000,000. Detroit, failing through the state commission and the courts to force a return to customers of taxable excess profits, levied a 20% excise tax against local utilities. OPA ruled out fuel and other automatic rate adjustments, because it considered them inflationary. The New York commission ruled 5½% return to be fair, while Pennsylvania allowed over 6% because of postwar equipment needs.

National Association of Railroad and Utilities Commissioners intervened in an Arkansas aluminum rate case where states rights were being challenged. As a result of the Jersey Central supreme court decision it voted to ask congress to amend the Federal Power act to prevent FPC encroachment on state jurisdiction.

Several bills were introduced during the year to tax public power. One was passed in Georgia but vetoed by the governor. There was also a large amount of investigation of public power, including REA, Columbia river, Shipshaw and Grand river flood control. Texas investigated all public power activities in the state.

The supreme court in the Jersey Central case extended federal jurisdiction to intrastate utilities connected to interstate lines, even though they had no control over interstate delivery. Because so many justices disqualified themselves, it was impossible to get a quorum to review the "death sentence" decision of a lower court in upholding Section 11(b)(1) of the Holding Company act.

GLASS GLOBE which is lighted electronically by a high frequency radio beam, without wires. The inside of the globe is coated with phosphors

Lighting.—Changes in lighting equipment design were limited in 1943 to substitutes to meet limitation orders of WPB and to equipments for some special war purpose. Many of these, however, were expected to find their way into peacetime use after the war. Half the previous types of lamps were permitted and the seven normal voltages were restricted to three, 115, 120 and 125 volts. Fluorescent lamp manufacture was restricted to white and daylight.

A number of special war application lamps, especially for aeroplanes, were developed. Sealed-in reflector type lamps in many new forms were introduced. Lime glass was used in place of lead in fluorescent tubes and a plastic base was found. Considerable headway was made in starterless fluorescent lighting, although the material situation was responsible for holding up some work. Material savings also gave impetus to the use of higher voltages with fluorescent lighting. The final limitation order on fluorescent fixtures limited metal to three pounds per fixture exclusive of ballast. Some modifications were made as the year came to an end.

Plastic reflectors were developed for industrial incandescent lighting. Portable extension fluorescent lighting was more common, especially for aeroplane assembly and servicing. Use of fluorescent tubes was extended to explosion-proof fixtures.

Lighting glassware was developed to withstand hydrostatic pressures up to 375 lb. per square inch, thermal shock from 302° F. dry to 41° F. in water in 15 seconds, and for airport practice

a dead weight of 300,000 lb. without fracture.

Indirect lighting of large high bay industrial areas with a mixture of 3 kw. mercury vapor and incandescent lamps was tried out satisfactorily.

Battery lighting for military emergency purposes found several applications, such as markers for supplies dropped by parachute and floating lanterns without oil ignition hazard for use with shipwrecks. Cold cathode found an enlarged field of application. Considerable research work in this type of lighting was started. At the year's close, the Illuminating Engineering society voted to set up an independent research foundation to engage broadly in lighting research. Electric Transmission and Distribution: *see* ELECTRICAL INDUSTRIES.

Electric Transportation.

All forms of electric transportation in the United States and Canada were called upon to render tremendously increased service in 1943. Shortages of rubber and gasoline sharply curtailed the use of private automobiles and thereby placed a heavy added burden on public transportation. The motor bus, which had made big inroads on the business of electric transportation before the war, was unable to take care of the increased demand. Motor bus operations were, in fact, somewhat reduced for a time on account of the gasoline shortage.

Street cars showed the largest increase in traffic of all forms of electric transportation, having a gain estimated at about 2,000,000,000 passengers. Rapid transit—subway and elevated railway services—showed only a small gain in patronage. This was due to the fact that the great bulk of the rapid transit riding is in the city of New York, where the use of private automobiles has always been relatively low and there has been comparatively little expansion of industry due to the war. As a consequence there was not the same increase in demand for public transportation as in many other cities. Riding on electric trolley buses showed a big percentage increase, but this form of electric transportation was not developed to a point where it was very important numerically from the standpoint of passengers carried. Because the electric operations of the trunk line railroads were considered as part of their general operations, no exact figures were available as to the extent of their increase in traffic. Indications were that the gain in electric suburban traffic was approximately 10%. The main line traffic gains of electrified railroads such as the Pennsylvania, New Haven and others followed the general trend of railroad traffic.

Table I.—*Passengers, Vehicle Miles and Revenue*

	1943	1942	Percent Increase
Passengers Carried			
Street car	9,100 million	7,188 million	26.6
Rapid transit	2,700 ,,	2,580 ,,	4.7
Electric coach	1,300 ,,	979 ,,	32.8
Total	13,100 ,,	10,747 ,,	21.8
Vehicle Miles			
Street car	963 million	844 million	14.0
Rapid transit	458 ,,	465 ,,	−1.5
Electric coach	164 ,,	145 ,,	13.1
Total	1,585 ,,	1,454 ,,	9.0
Revenue			
Street car	$522 million	$402 million	29.8
Rapid transit	152 ,,	144 ,,	5.2
Electric coach	70 ,,	53 ,,	33.4
Total	$744 ,,	$599 ,,	24.0

(Data from American Transit Association)

Table II.—*Ten-Year Record of Passengers Carried*

Calendar Year	Surface Railway	Rapid Transit	Trolley Coach	Total
1933	7,074,000,000	2,133,000,000	45,000,000	9,252,000,000
1934	7,394,000,000	2,206,000,000	68,000,000	9,668,000,000
1935	7,276,000,000	2,236,000,000	96,000,000	9,608,000,000
1936	7,501,000,000	2,323,000,000	143,000,000	9,967,000,000
1937	7,161,000,000	2,307,000,000	289,000,000	9,757,000,000
1938	6,545,000,000	2,236,000,000	389,000,000	9,170,000,000
1939	6,171,000,000	2,368,000,000	445,000,000	8,984,000,000
1940	5,943,000,000	2,382,000,000	534,000,000	8,859,000,000
1941	6,074,000,000	2,410,000,000	641,000,000	9,125,000,000
1942	7,188,000,000	2,580,000,000	979,000,000	10,747,000,000

(Data from American Transit Association)

The 1943 riding on all forms of electric transportation services far exceeded the figures for any of the 10 previous years. For the electric trolley coaches they reached an all-time peak. For the subway and elevated railway lines they were close to peak levels. For the street railways, however, the number of passengers amounted to only about three-fourths of the number carried in the 1920's, when the extent of the surface electric railway systems was much greater than at present. Table I, accompanying, gives the details of changes in traffic, vehicle miles and revenue in 1943 as compared with 1942. Table II presents the traffic record for the previous 10 years.

Trackage.—Exact statistics were not available concerning the changes that took place in electric railway track mileage and trolley bus route in 1943. Street railway service was resumed on a number of lines where it had previously been abandoned, but the mileage involved was not great. The general purpose of these extensions was to release motor buses for service to war plants to which rail service was not available. A few minor extensions were made to trolley bus routes, but again the mileage involved was relatively slight. Rapid transit trackage showed practically no change.

Lack of changes in the extent of electric transportation systems was due principally to the policy established by the local transport division of the office of defense transportation, which, broadly speaking, ruled against either extensions or abandonments of electric transportation systems. Much the same condition prevailed in 1942. As a result the situation in 1943 was approximately the same as that existing at the beginning of 1942 when there were some 15,000 mi. of surface electric railway track in the United States, about 1,200 mi. of rapid transit track and 2,000 mi. of trolley bus route.

Equipment.—The large increase which took place in riding created a serious problem with respect to equipment. At the beginning of 1943 the electric transportation systems, not including the electrified suburban railroads, had a total of only 40,871 vehicles as compared with more than 58,000 10 years earlier when the traffic demands were considerably less. Table III shows the amount and distribution of this equipment. Energetic efforts were made to secure additional vehicles but war conditions made it almost impossible to do so. The war production board authorized the construction of only 270 new street cars and 75 electric trolley buses during 1943. No new rapid transit cars were authorized. This was only about half of the number of vehicles authorized in 1942. The 1943 total was far below normal replacement requirements. As a result the electric transportation systems were hard pressed to meet the demands placed upon them. A considerable number of old vehicles were taken out of storage and rehabilitated, but this was only a minor help in solving the problem. A further problem was created by the shortage of replacement parts, which made it impossible to keep the full complement of vehicles in regular operation. Despite these handicaps, the electric transportation lines, generally speaking, accepted the

greatly increased loads that were thrust upon them and handled them safely and efficiently.

Table III.—*Electric Transportation Equipment as of Jan. 1, 1943*

Population of Cities	Passenger Cars		Trolley Buses	Total
	Surface Railways	Rapid Transit		
Over 500,000	15,993	10,278	671	26,942
100,000 to 500,000	6,916	—	2,209	9,125
50,000 to 100,000	1,644	—	292	1,936
Less than 50,000	896	—	191	1,087
Suburban Areas	1,781	—	—	1,781
Total for U.S.	27,230	10,278	3,363	40,871

Elks, Benevolent and Protective Order of.

This fraternal order was organized in 1868 in New York city for the purposes of practising charity, justice, brotherly love and fidelity; promoting the welfare and enhancing the happiness of its members; quickening the spirit of American patriotism and cultivating good fellowship. Membership was limited by statute to white male citizens of the United States, 21 yr. of age, or over. In 1943 there were 1400 lodges in the order, with a membership of 575,000. Charitable expenditures for 1942–43 amounted to more than $2,250,000. *The Elks Magazine,* the official organ, was instituted in 1922. A home for aged and indigent members was established in Bedford, Va., in 1902; and, in 1926, in Chicago, Ill., a superb memorial building was dedicated to members who served in World War I. The order created the Elks National Foundation fund in 1928, to finance scholarships for deserving students and the care of crippled children and tubercular patients.

An Elks War commission was appointed in 1942, to co-operate fully with the United States government in the prosecution of the war. (J. E. Ms.)

Ely, Richard Theodore

(1854–1943), U.S. economist, was born April 13 on a farm at Ripley, Chautauqua county, N.Y. After studying at Columbia university, he went to Germany on a fellowship in letters, took his Ph.D. at Heidelberg, 1879, and completed his studies at Halle, Geneva and at the Royal Statistical Bureau in Berlin. On his return to the United States, he was named professor of political economy at Johns Hopkins, 1881. His advocacy of greater academic freedom and his then controversial history of the labour movement in America aroused widespread indignation among conservative elements. Their clamours for his dismissal led to his resignation in 1892. Dr. Ely then went to the University of Wisconsin as head of the department of political economy, and later established the Institute for Research in Land and Public Utility Economics, which was subsequently transferred to Northwestern university in 1925, when he became research professor at that school.

Dr. Ely, who stayed at this post until 1933, died in Old Lyme, Conn., Oct. 4.

Emergency Management, Office for.

On May 25, 1940, President Roosevelt, in an administrative order issued "in pursuance of Part I of Executive Order No. 8248 of September 8, 1939," found the existence of a threatened national emergency and established, in the executive office of the president, the Office for Emergency Management. Thus, the Office for Emergency Management (OEM) was created a few days prior to the establishment of the Advisory Commission to the Council of National Defense on May 29, 1940.

On Jan. 7, 1941, the president issued Executive Order No. 8269 establishing the Office of Production Management within the Office for Emergency Management. This was a significant step, in that the Office for Emergency Management replaced the Advisory Commission to the Council of National Defense as the over-all co-ordinating defense organization.

In Aug. 1943, the following agencies were within the framework of the Office for Emergency Management:

Board of War Communications (*q.v.*); National War Labor board (*q.v.*); Office of Alien Property Custodian; Office of Civilian Defense (*q.v.*); Office of the Coordinator of Inter-American Affairs (*q.v.*); Office of Defense Transportation (*q.v.*); Office of Lend-Lease Administration; Office of Scientific Research and Development (*q.v.*); Office of War Information (*q.v.*); War Manpower commission (*q.v.*); War Production board (including the Office of Rubber Director) (*q.v.*); War Relocation Authority (*q.v.*); War Shipping administration; Office of Economic Warfare; Office of Economic Stabilization (*q.v.*); Office of War Mobilization (*q.v.*); the Committee on Fair Employment Practice and the Division of Central Administrative Services.

The Emergency Price Control Act of 1942, approved by the president on Jan. 30, 1942, created the Office of Price Administration (*q.v.*) as an independent agency under the direction of a price administrator, outside the boundaries of OEM, wherein it had previously been lodged. The functions of the Office of Defense Health and Welfare Services were transferred to the Federal Security agency April 29, 1943. The Civil Air patrol was transferred to the War department April 29, 1943.

The administrative order of May 25, 1940, provided that OEM "shall be under the direction of one of the Administrative Assistants to the President, to be designated by the President." An administrative order of Jan. 7, 1941, which further defined the functions of OEM, provided that "Provision may be made . . . for the maintenance of routine office services required in the conduct of the work and activities of the agencies coordinated through or established in the Office for Emergency Management." W. H. McReynolds was the first liaison officer for Emergency Management. In April 1941 he was succeeded by Wayne Coy, who was liaison officer in addition to being assistant director of the Bureau of the Budget. On June 8, 1943, James F. Byrnes, Director of War Mobilization, succeeded Mr. Coy as liaison officer. On July 29, 1943, the functions of the liaison officer with respect to the Division of Central Administrative Services were vested in the director of the division. (J. F. B.)

Employment.

Steady spread of war and the increased significance of industrial production of almost all kinds in the global war after 1939 resulted in an expanding tempo of world economic activity through 1943. Employment increased to maximum levels in practically all countries, although some suffered economically because of isolation by naval blockades. In others, for instance those countries conquered by Germany, there was plenty of work but very little livelihood for large masses of people.

One cannot have complete confidence in the employment statistics of many nations. The war diverted attention and funds from the task of gathering statistics. The general picture derived

from the data reported by the various nations to the International Labour Office is undoubtedly correct; but, with the exception of the figures on Great Britain, Canada, the United States, Sweden and Union of South Africa, all figures were in 1943 incomplete or of doubtful validity. One would not be justified in basing calculations and comparisons upon the figures available for countries other than those mentioned above.

The published figures are of two principal kinds and were gathered in several different ways: statistics of employment, *i.e.*, the number of persons in paid employment, and statistics of the number of persons unemployed or of the number applying for work at the employment exchanges.

The employment statistics are derived from establishment reports collected by mail or through field agents or inspectors. Unemployment statistics are obtained from the number of applications for work on file at the employment exchanges, the number of applications for benefits at the offices of unemployment insurance agencies, and also from unemployment relief records, reports of trade union secretaries and special censuses of unemployment.

United States.—Employment reached an all-time high in the United States in 1943, with 55,500,000 persons reported by the United States bureau of labor statistics as being employed in July 1943. This did not include the 9,300,000 in the armed forces.

The manufacturing employment index in Sept. 1943 was 160.5 (using 1929 base). On the new base (1939=100), the index figure for Sept. 1943, was 170.2. The index of employment in the durable goods industries (1939=100) was 230.7 in Sept. 1943. It was 122.6 in the nondurable goods industries.

The U.S. census bureau's estimate of expected growth of the female labour force between April 1940 and Aug. 1943 (based upon the trend from 1930 to 1940) was 900,000, whereas the actual increase was about 4,000,000, indicating an increase in female employment of 3,100,000 directly attributable to the war. From the time the United States entered the war up to Aug. 1943, women between the ages of 35 and 54 in the labour force increased by 1,400,000, or about 1,100,000 more than the growth which would normally have occurred under peacetime conditions. A large proportion of these were older, married women who had no children or whose children no longer required their care.

The number of women employed in agriculture was more than three times as large in August, 1943 as in April, 1940. Of the 3,100,000 women who entered employment after 1940, about 1,300,000 were working on farms.

Great Britain.—Of the 16,000,000 men in Great Britain between 14 and 64 years of age, more than 15,000,000 were either in the armed services or in paid employment in 1943. Of the 17,000,000 women between 14 and 64 years of age, 7,750,000 were in paid employment or in military services. Of the single women between 18 and 40 years of age, 91% were in paid work; and of the married women without children in the same age group, 80% were employed in some capacity in the war effort. More than 1,000,000 men and women over 64 years of age were in paid employment.

After the outbreak of the war, 800,000 women between the ages of 40 and 60 entered industrial employment, thereby doubling the number of paid women workers in this age group. In 1939 the British Employment exchange statistics showed an average of 1,297,801 persons wholly out of work. In 1942 the corresponding figure was 117,244 and in July 1943, 72,140.

This represented, probably, as high a percentage of a total population actually employed as it was practicable to achieve. It was more complete employment of the population than obtained in the United States or Canada in 1943.

Canada.—The Canadian industrial employment index (1929=100) was 193.9 in July 1943, indicating a somewhat larger drift of population from rural to urban employment than in the United States. The index of general employment in Canada (as in the United States) did not go as high as the index of industrial employment. It stood at 156.2 in July 1943 (1929=100).

South Africa and Australia.—The Union of South Africa employment index stood at 160.7 (1929=100) in June 1943, which was approximately the same level of employment which had existed since 1941. Australia's figures were incomplete and provisional but indicated for the first quarter of 1943 approximately the same level of employment which had obtained throughout 1942. The indexes were approximately 35% above 1933, which is the base year for Australia.

South America.—Argentina's statistics showed that industrial employment had been gradually rising from 1940 on, and the index in July 1943 was 129.2 (1937=100). Very little change occurred in the index of Argentinian employment throughout 1942–43. The index for Chile was 128.0 in April 1943 (1937=100). Employment had remained at approximately that level since 1941.

Japan.—Japan published provisional figures showing industrial employment in 1943 approximately double that of 1929. The index for May 1943 was 206.0 (1929=100) but all of the Japanese figures for 1943 were published as "provisional figures." If correct, they would indicate that industrial employment in Japan had risen more than in most of the countries of the world. This would not be surprising, in view of the large increase in raw materials and supplies available to the Japanese.

Sweden.—The Swedish index of employment, contrary to those of other countries, showed lower employment in 1942–43 than obtained from 1935 through 1939. The index stood at 110.0 in 1938, 112.7 in 1939 and 109.2 in 1940 (1929=100) but throughout 1942 and 1943 the index fluctuated between 96 and 90, and in Aug. 1943, was only 90. This may have resulted from the cutting off of foreign trade to some extent by Allied blockades intended to prevent Swedish products from reaching Germany; and German closure of access to the Atlantic.

None of the other countries published employment statistics in 1943, and it was impossible to determine from the figures published for previous years what the trends of employment would be in the respective countries during 1943. Many of them were in the war zone and their employment situation was directly affected by the war; *e.g.*, Norway, the Netherlands, Poland, Rumania, Switzerland, Russia, Germany, Denmark, Finland, France, Czechoslovakia and Hungary. (D. D. L.)

Endocrinology.

Relatively simple chemical compounds apparently may be used to depress the activity of certain glands in a specific manner. Thiourea and its derivatives exert this effect upon the thyroid gland; alloxan depresses the insulin-secreting cells of the pancreas. These discoveries may lead the way to further advances in physiological knowledge and to the development of chemotherapy in the treatment of glandular disorders.

Anterior Pituitary Gland.—There was further separation and purification of the anterior pituitary hormones. The work of Fraenkel-Conrat and others in the laboratories of H. M. Evans established more firmly that the following hormones are separate entities: lactogenic, interstitial-cell stimulating (ICSH), follicle stimulating, growth, thyrotropic and adrenocorticotropic. The gentleness of the chemical methods which were used deprecated the possibility that the active fractions might be decomposition products of an original single large molecule.

While the anterior pituitary gland is essential to true growth (increase in length), it is not essential to the formation and deposition of adipose tissue (increase in weight). Hetherington further demonstrated that hypothalamic injury could lead to obesity even in animals which had been hypophysectomized for a long enough period to induce thyroid and adrenocortical atrophy. The latter glands are therefore also nonessential as regards weight gain by fat deposition.

As regards the influence of the anterior pituitary on growth, Evans *et al.* demonstrated that the action of growth hormone was antagonized by the simultaneous administration of adrenotropic hormone. This is in accord with the opposing effects of the anterior pituitary and the adrenal cortex on nitrogen retention, but it complicates our understanding of the regulation of growth by the anterior pituitary gland.

The level of thyrotropic hormone in the blood is low in hyperthyroidism and high in hypothyroidism. This seemed to indicate that the anterior pituitary could not be a primary aetiological factor in these thyroid disturbances, and that the variations in thyrotropic hormone might be an attempt at compensation. A new light was shed on this problem when it was discovered that thyrotropic hormone was inactivated by incubation with slices of thyroid tissue. Rawson *et al.* reported further work to show that hyperplastic and hyperfunctioning thyroid tissue had a greater inhibitory action, while hypofunctioning thyroid tissue had practically no inhibitory effect upon thyrotropic hormone in vitro They also found that the inactivation depended upon an oxidation, probably of a sulfhydryl to a disulfide configuration, and that the inactivated thyrotropic hormone could be reactivated by suitable chemical measures. This work indicated the necessity for a re-investigation of anterior pituitary-thyroid regulation, using the total thyrotropic content (active plus reactivated) of blood and urine as an index of the regulatory activity of the pituitary.

A new aspect in the picture of anterior pituitary-thyroid regulation appeared in the observations of Reforzo-Membrives on the existence of a thyroid-inhibiting factor in the pituitary. He found that the administration of preparations of pituitary glands taken from animals previously treated with thyroid extract resulted in a depression of thyroid activity in the recipient animals. This was evidenced by the basal metabolism of the whole animal, and by the histology and respiratory capacity of its isolated thyroid tissue.

Thyroid.—Having previously investigated the thyroid hormone activity of casein which had been iodinated to varying extents, Reinecke and co-workers reported the production of other iodinated proteins which exhibited thyroid activities as much as four times that of natural thyroglobulin. Hydrolysis of these compounds yielded 80 times as much l-thyroxine as can be prepared from equal amounts of desiccated thyroid glands.

The possibility of thyroid hormone production in tissues of the living organism other than the thyroid gland was substantiated by Chaikoff and co-workers. They demonstrated the production of both diiodotyrosine and thyroxine not only in thyroidectomized rats, but also in rats from which both the thyroid and the hypophysis had been removed. This, and previous related work, invited a reasonable speculation of a general nature, namely, that the endocrine glands may not be the sole sites of hormone production in the body but may be merely collections of specialized cells which can produce the hormones more efficiently than other cells.

Previous observations on the production in experimental animals of hyperplastic thyroid enlargement accompanied by evidences of decreased rather than increased thyroid function, led during 1943 to the therapeutic use of thiourea and thiouracil in human hyperthyroidism. Kennedy had reported experimentally produced goiters in animals fed on rape seed. Mackenzie and Mackenzie described a similar syndrome as a result of sulfanilamide treatment, and Richter obtained identical results with thiourea. The Mackenzies and Astwood further reported that thiourea and its derivatives did not produce hypothyroidism by antagonizing the action of thyroid hormone but rather by preventing the gland from producing it. The hyperplasia of the thyroid did not occur in the absence of the pituitary gland, nor did it develop when thyroid extract was administered simultaneously with the thiourea. All these results support the following hypothesis: Thiourea (and sulfanilamides) interfere with the formation of thyroid hormone from its precursors. The lowered level of thyroid hormone in the blood leads to a counter-regulatory action on the part of the pituitary gland as a result of which there is thyroid hyperplasia. In the presence of the thiourea the hyperplastic tissue is impotent as regards the production of thyroid hormone so that functional hypothyroidism persists.

The successful treatment of hyperthyroidism by thiourea and thiouracil, including reduction of the goiter, was reported in some 15 human cases by Astwood, Williams and Himsworth.

Pancreas.—Jacobs had previously found that the administration of alloxan caused hypoglycaemia in rabbits. Using the drug for another purpose Dunn and co-workers confirmed Jacobs' observation and (among other pathological findings at post-mortem examination) discovered a necrosis of the insulin-producing cells of the pancreas. Some of their animals which survived the initial effect of the drug later developed a permanent diabetes. By varying the dose of alloxan so as to avoid death from hypoglycaemia and damage to tissues other than the pancreas, Goldner and Bailey and Bailey were able to produce diabetes practically at will in rats, guinea-pigs, rabbits and dogs. In the latter experiments kidney and liver damage seemed to be at a minimum, the acinar tissue of the pancreas and the α-cells of the islands of Langerhans appeared to be entirely unaffected, while the β-cells of the islands were completely destroyed. These observations offered a new tool for the investigation of the diabetic syndrome and perhaps also of the separate functions of the component cells of the islands of Langerhans. The possibility of the use of alloxan for the treatment of spontaneous hyperinsulinism also emerged. (*See* also PHYSIOLOGY; ZOOLOGY.)

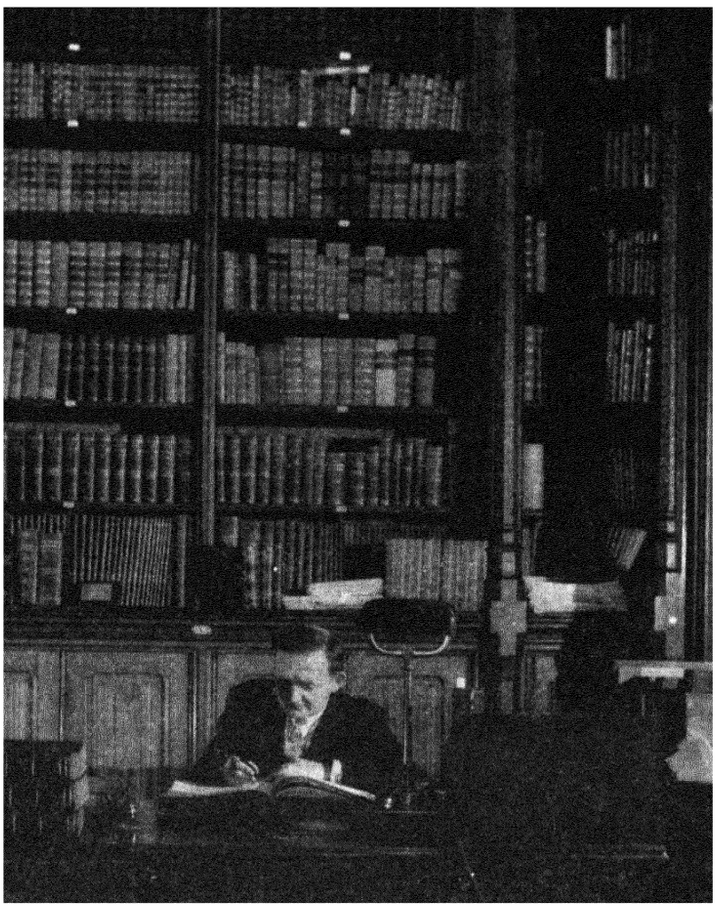
England: *see* GREAT BRITAIN AND NORTHERN IRELAND, UNITED KINGDOM OF.



English Literature.

All things considered—and how much that is utterly antagonistic to letters is contained in that word "all"—English literature in its varied branches made a surprisingly good showing in the year 1943. The war, it is perhaps safe to say, inspired directly no book of permanent value, either in verse or prose; and the book which possibly came nearest to interpreting its deeper significance in a lasting form, Richard Church's *Twentieth-century Psalter,* is, understandably enough, the work of an older poet, not immediately involved in the military conflict. Great poetry springs from action and contemplation, and the stress of action which has most younger writers by the throat leaves no leisure for distilling experience. Such war poets, therefore, as John Pudney in *Beyond This Disregard,* Alan Rook in *These Are My Comrades* or the contributors to the anthology, *More Poems From the Forces,* though by no means mere impressionists, more often reflected sensitively or graphically on particular incidents of war or war-training than crystallized something memorable. An exception might be made in prose for M. Saint-Exupéry's *Flight to Arras,* which did translate action into dramatic spiritual experience. But the best war books were like A. B. Austin's account of the Dieppe raid, *We Landed at Dawn,* vivid and accurate journalism. And the best poetry of the year, though it assimilated something of the agony through which humanity is passing, was not immediately concerned with the war. Mentioned particularly should be Kathleen Raine's *Stone and Flower, The Angry Summer* by Idris Davies, Edwin Muir's *The Narrow Place,* Cecil Day Lewis' *Word Over All* and Lawrence Durrell's *A Private Country.* Edith Sitwell's *A Poet's Notebook* also deserves special mention as a book of lasting value for all who would study the meaning of the poetic in art and life.

The year produced three particularly good books of criticism, David Cecil's *Hardy the Novelist,* C. M. Bowra's *The Heritage of Symbolism* and Charles Williams' *The Figure of Beatrice.* So cultivated a critic as Lord David Cecil might easily have been more alive to Hardy's artistic defects than to his profound poetic qualities. But by basing his appreciation on the latter, he composed a book which is a model of wise imaginative appraisement. C. M. Bowra covered a wide field in studies of Valéry, Rilke, Stefan George, Blok and Yeats. But through the diversity of his subject matter he found a common aim in the effort of these poets to find a new way to the reality which orthodox religion has ceased to possess. Charles Williams' study of Dante also broke new human ground but within the spiritual realm of orthodoxy. Other critical books deserving mention are E. M. W. Tillyard's *The Elizabethan World Picture,* Evelyn Hardy's *Donne: A Spirit in Conflict,* Janko Lavrin's *Dostoevsky* and F. A. Lea's *Carlyle: Prophet of Today.*

Perhaps the most notable biography of the year was Catherine M. Maclean's *Born Under Saturn,* a life of Hazlitt so industriously and understandingly complete that it is unlikely to be superseded. The Countess of Birkenhead's life of Joseph Severn, *Against Oblivion,* was pleasantly done as was J. A. Lloyd's *Ivan Turgenev.* Georgina Battiscombe's *Charlotte Mary Yonge* was an appreciative biography of a Victorian novelist, who, despite her sheltered religious respectability, is still read, and a trusty guide to her many novels. Of timely interest was Hampden Jackson's *Jean Jaurés,* a biography of the French socialist, and Lord Rayleigh's *Life of Sir J. J. Thomson,* the scientist.

Fiction continued to show few surprises. There was plenty of able story-telling and much of it provided a good journalistic picture of war conditions, the most notable of this kind being J. B. Priestley's documentary *Daylight on Saturday.* But of really creative work there was little. C. S. Lewis' *Perelandia* was an imaginatively ingenious picture of life on the "unfallen" planet Venus. Robert Graves's *Wife to Milton* was a clever period reconstruction, but far from fair to Milton. James Hanley's *No Directions* and Neil M. Gunn's *The Serpent* had the compelling quality to be expected of their authors, and *Saturnine* by Rayner Heppenstall was at least experimental, if not to many people's taste. Virginia Woolf's collected short stories, *A Haunted House,* were, it need hardly be said, of exceptional distinction.

HILARY ST. GEORGE SAUNDERS, popular British novelist of World War II, at his desk in the parliament library. His *Combined Operations,* published in 1943, tells the story of the spectacular British Commando raid on St. Nazaire, France, in March 1942

It remains only to mention one or two books of religious, philosophical or political interest. Christopher Dawson's *The Judgement of the Nations* was a brilliant plea for a new cultural unity of Europe based on the common Christian tradition. Gerald Heard in *Man the Master* searchingly analyzed the diseased condition of modern man and looked to a caste of new Brahmins to effect a cure. Charles Raven wrote suggestively of *Science, Religion and the Future,* Herbert Read of *The Politics of the Unpolitical,* H. J. Massingham in *The Tree of Life* traced the kinship, so lamentably lost, of a true love of nature and a true Christianity, and Victoria Sackville West in *The Eagle and the Dove* discussed two famous saints, St. Teresa of Avila and St. Thérèse of Lisieux. (*See* also AMERICAN LITERATURE; PUBLISHING [BOOK].) (H. I'A. F.)

Entomology.

The war is having a marked influence on entomology as a science and a profession. There has been great need for trained men in the medical and sanitary work, especially in connection with the control of mosquitoes and the elimination of malaria, yellow fever and dengue fever; the elimination of lice and fleas to prevent typhus fever; as well as all other insect-borne diseases. The men most suitably trained for this service are the entomologists. Those students who had completed the regular university courses were accepted by the

armed forces—many of them were given commissions, while those having a Ph.D. degree or who had several years' experience after graduation were given commissions. These men were placed very largely in charge of making mosquito surveys, in identifying the mosquitoes and preparing keys, handbooks and manuals and in conducting campaigns for the extermination and control of these pestiferous and dangerous insects at home and abroad. In 1943 it was estimated that there were between 1,000 and 2,000 such men in the armed forces; 104 graduates in entomology at the University of California were in 1943 in the service of the U.S. and a similar situation undoubtedly held true for other universities and colleges throughout the entire country.

The insect control problems arising from the 2,000,000 victory gardens throughout the United States did much to make the nation entomology-conscious. The interest of all professional men, labourers and other classes would do much to emphasize the importance of insects to agriculture and might result in far greater support for this science in relation to public health, to agriculture and as an interesting and instructive field in biology. During this war period professional entomology advanced farther than in any previous period of 50 years.

Some New Insecticides.—A dichloroethyl ether sodium sulphate solution was used successfully by W. H. Lange, Jr. (1943) for the control of the cabbage maggot, *Chortophila brassicae,* in the Salinas valley, Calif. It was prepared by mixing 20 cc. of the former with 0.4 cc. of the latter, designated as Tergitol 7, in 1 gal. of water.

A propylene dichloride emulsion proved to be as effective as ethylene dichloride and more efficient than paradichlorobenzene for the control of the peach borer, *Conopia exitiosa,* in eastern United States (Snapp, 1943).

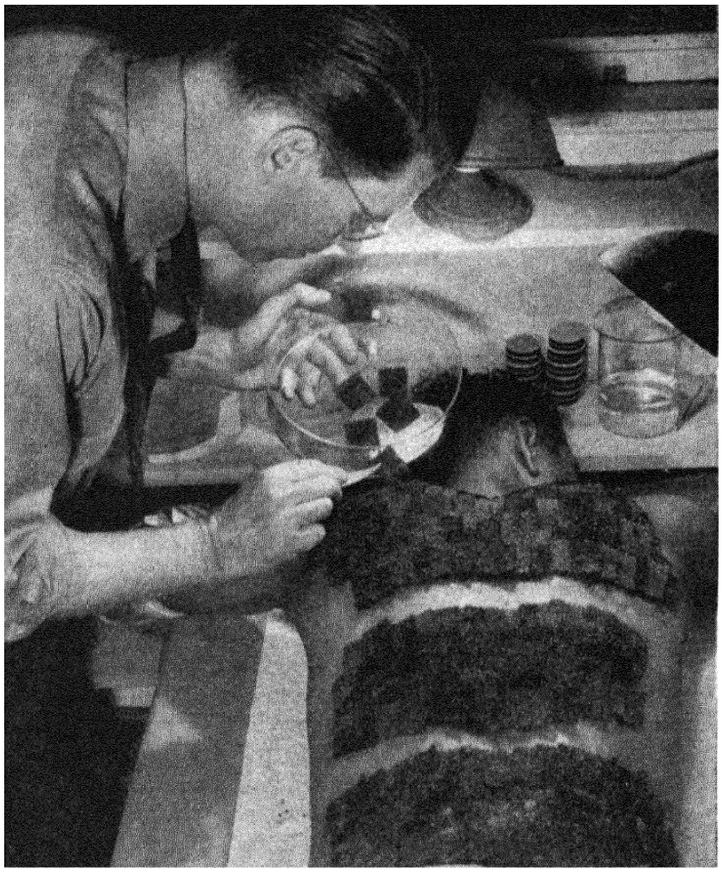
A commercial preparation, "Tritox" (trichloracetonitrile), is a clear, volatile, noninflammable liquid, the vapour of which has a great penetrating power and is quite toxic to insects and relatively harmless to man. Good results were obtained by H. Kemper (1941) with it in killing the adults of the granary weevil, *Sitophilus granarius,* the drugstore beetle, *Sitodrepa panicea,* the bean weevil, *Acanthoscelides obtectus,* and the larvae of the mealworm, *Tenebrio molitor,* and the Mediterranean flour moth, *Ephestia kühniella.*

Quartz dust at 1 to 2% mixed with stored grain to prevent infestation and destruction by the granary weevil, *Sitophilus granarius,* in Europe was found to cause silicosis and its use was prohibited in Germany in 1941.

The use of rotenone dusts for the control of the pea weevil, *Laria pisorum,* on field peas was prohibited in order to conserve this important insecticide for the protection of more essential food crops. The application of this insecticide to edible peas for drying, when just flowering, in Washington did not give complete control, so that it was necessary to fumigate all dry peas at harvest to insure complete protection from this weevil (Webster, *et al.,* 1943).

Cryolite in light medium oil sprays gave control of the codling moth equal to arsenate of lead sprays in Washington during 1941–1942. Very light oil sprays killed from 79.7 to 89.6% of codling moth eggs. Micronized phenothiazine and xanthone gave satisfactory control of this important apple insect but also caused injury to the calyx or the fruit (Webster, *et al.,* 1943).

Adding proprietary thiocyanates to cubé dusts improved the control of pea aphis, *Macrosiphum onobrychis* (Wilson and Campau).



Aerosols are air or gaseous suspensions of atomized or finely divided particles of nonvolatile insecticides, certain types of which are also designated as air suspensions and as insecticidal smokes. According to Roark (1942) aerosols are formed by dispersing nonvolatile insecticides in the air or by enhancing the efficacy of fumigants of low volatility by dispersing a liquid or solid in the air in colloidal form, thus creating a mist or smoke. Certain types were formed by spraying the insecticide against a hot plate, by evaporating a low melting solid such as naphthalene by means of an electric heater and by spraying solutions in liquefied gases.

In the former case the materials were sprayed directly on a plate heated to 400 C. (752° F.) and the dispersing particles carried through a venturi tube into a cylinder or other container by a strong air blast. In this manner orthodichlorobenzene containing 5% lauric acid used at the rate of 1½ lb. per 1,100 cu.ft. of air space completely killed all specimens of the American cockroach, *Periplaneta americana,* German cockroach, *Blatella germanica,* the bedbug, *Cimex lectularius,* and the confused flour beetle, *Tribolium confusum.*

Orthodichlorobenzene with oleic acid gave good control of the housefly, *Musca domestica.* Orthodichlorobenzene is also a good activator and solvent of other insecticides (Goodhue and Sullivan, 1941). Other investigations by Goodhue (1942) resulted in the formation of aerosols without heat. The insecticide is dissolved in a liquefied gas in a closed container and afterward released through a spray nozzle by its own pressure. The solvent forms the aerosol by rapid evaporation, the heat of evaporation being supplied by the atmosphere. The solvent must be gaseous at temperatures considerably lower than when the insecticide is to be used as a spray or aerosol and the preparation must therefore be made at temperatures considerably lower than those occurring normally indoors or outside where the materials are to be used. An example of very effective aerosol extensively employed in 1943 in the control of mosquitoes and houseflies indoors where the insecticidal vapour can be held is prepared by incorporating 0.4% pyrethrins in 1% sesame oil, and mixing them with dichlorodifluoromethane which acts as a solvent and expelling gas. A dosage of 5 mg. pyrethrins and 10 mg. sesame oil in the solvent expelled under pressure caused by room temperature is sufficient to kill mosquitoes in 1,000 cu.ft. of air space. This and similar aerosols are prepared in convenient-sized bombs for treating rooms, buildings, tents and other enclosures and have proved to be a marvelous means of reducing malaria, yellow fever and other mosquito-borne diseases in temperate and more particularly in the tropical regions where these diseases are among the most important hazards in modern warfare.

Vapour sprays are similar to aerosols in that they consist of very finely divided particles of insecticides suspended in air. This condition is brought about by selecting an oil-soluble insecticide such as pyrethrum and forcing it under great pressure through a fine nozzle and a venturi tube in sufficient quantities to form a cloud which may be directed to envelope a vine or a tree in a very fine mist or a coarser spray if desired. Insects are killed by direct contact with the chemicals. Light, highly refined oils are used so as to avoid injury to the plants. The insecticides are applied with hand atomizers for small gardens and specially constructed power machines that make it possible to cover large acreages of field crops and orchards in a short time. These vapour sprays have been most useful in the control of small insects and mites such as thrips, aphides, scale insects, leafhoppers, orchard red spiders and similar mites. They are also applied by aeroplane. They might be said to be the forerunners of modern fly sprays and aerosols. Both have the great advantages of ease of application and small labour requirements in the treatment of insect pests. They are most successfully used when there is a minimum of wind or air movement.

Rotenone is a crystalline chemical compound ($C_{23}H_{22}O_6$) and a poisonous principal derived from certain leguminous plants

LICE feeding on the back of a volunteer in the laboratories of the U.S. department of agriculture in 1943. The lice are placed on the host's back by means of cloth squares. This method is used to maintain a supply of lice to be used in testing new insecticides for the armed forces

which has long been used by the natives of various countries as a fish poison. It is obtained chiefly from the roots of *Derris elliptica, D. uliginosa* and *D. malaccensis,* which furnish the derris-root of commerce produced in the Malay states and the East Indies. A secondary and growing source is obtained from roots of cubé or timbo, the source of which is *Lonchocarpus urucu* and *L. utilis* and *L. chrysophyllus* of tropical South America, the latter also being cultivated in the Federated Malay states; and still another source is from *Tephrosia toxicaria* of tropical South America and *T. vogalii* of tropical Africa and many other species. A possible commercial source may be available from *T. virginiana* of North America. Still other sources are *Mundulea sularosa* of tropical east Africa, Madagascar, India and Ceylon; and *Millettia* spp. (closely related to *Wisteria* spp.) of China, Formosa and India.

Because of its high toxicity to insects and its low toxicity to man rotenone is specially useful on vegetables and leafy crops consumed in the green or fresh condition. However, it has great value in controlling certain specific insects and much of the available material was either taken over by the army or placed on strict rationing bases for agricultural necessities.

A tremendous amount of investigation work throughout the world was done testing the effects of rotenone products on a great many species of insects. References to a number of published accounts of these researches were collected and published (mimeographed) in the "E" series of the bureau of entomology and plant quarantine, United States department of agriculture by R. C. Roark. These refer to the following orders of insects: Part I Collembola, Orthoptera, Dermaptera, Odonata, Isoptera, Corrodentia and Mallophaga. Part II, Thysanoptera. Part III Hemiptera, Homoptera. Part IV Hemiptera, Heteroptera. Part V Anoplura. Part VI Coleoptera.

Insect Resistance to Insecticides.—Economic entomologists have been interested in the resistance of certain insects to the continued use of the specified insecticides. This condition was first reported by A. L. Melander in connection with the resistance of the San Jose scale, *Quadrapidiotus perniciosus,* to lime-sulphur sprays in the apple region of the state of Washington in 1914. From then on, many other insects were thought to be resistant to insecticides. Up to 1943 there appeared to be experimental proof of such resistance in the following cases:

1.—San Jose scale, *Quadrapidiotus perniciosus,* to lime-sulphur sprays.
2.—Red scale, *Aonidiella aurantii,* to HCN fumigation.
3.—Black scale, *Saissetia oleae,* to HCN fumigation.
4.—Citricola scale, *Coccus pseudomagnoliarum,* to HCN fumigation.
5.—Citrus thrips, *Scirtothrips citri,* to tartar emetic-sucrose sprays.
6.—Codling moth, *Carpocapsa pomonella,* young larvae to arsenical and other sprays.
7.—Screwworm, *Cochliomyia americanum,* primary larvae to phenothiazine.

Codling Moth Investigations.—While most insects are more or less sporadic in their appearance in destructive numbers and require only occasional treatment, the codling moth maintains a remarkably even level and requires a regular control program every year. For many years lead arsenate was the standard insecticide used for its control. This routine was greatly disturbed because of the presence of arsenate of lead residue on the outside of the fruits. Then began a thorough and extensive search for insecticidal substitutes for lead arsenate. These investigations resulted in many attempts to substitute organic compounds like nicotine, rotenone, pyrethrum and other plant products for the inorganic compounds or the heavy metals. Some of these new organics proved quite successful and were being used to great advantage during World War II when arsenical compounds had not always been readily available for pest control purposes.

Cattle Grubs.—Estimates by the United States department of agriculture placed the losses due to the cattle industry by grubs in the United States at $50,000,000 while the University of Idaho believed the losses to be twice as much. The grubs seriously affect the living animals and spoil much of the hides for leather. A very effective control was perfected which consists of a mixture composed of one part of ground derris or cubé, 5% rotenone content and three parts of tripoli earth or pyrophyllite. This dust is applied at the rate of 3 oz. to the animal by means of a hand shaker-top can. Two men work on opposite sides of the same animal—each applying the dust with one hand and rubbing it into the hair with the other hand. In this way two men may treat as many as 100 head of cattle a day.

Wood Preservatives for Control of Termites.—According to Snyder (1943) there are three general classes of wood preservatives employed in preventing the attacks of termites: (1) oils such as creosotes and combinations of petroleum or tar. These are specially recommended for treatment of timbers which may be used in contact with the ground. (2) Water-soluble salts such as zinc chloride—chromated zinc chloride, and (3) a number of proprietary preservatives.

Pierce's Virus Disease Carried by Leafhoppers.—One of the most serious of virus diseases was found to be the cause of the Anaheim disease of the grape which practically annihilated the wine grape industry in Orange county in California around the turn of the century. At that time the cause of the disease was unknown. Later the virus was discovered to be the cause of this disease and the disease was called Pierce's disease. Even after the virus was discovered there remained to be found the sources or vectors responsible for transmitting the disease to the grapevines. This was accomplished and at least three leafhoppers were known in 1943 to be vectors of the disease: the green sharpshooter, *Draeculacephala minerva,* the red-headed sharpshooter, *Carneocephala fulgida,* and the blue sharpshooter,

Cicadella circellata. Another leafhopper, *Helochara delta,* was suspected as a carrier.

C. V. Riley Centennial.—In Sept. 1943 the centennial celebration of the birth of C. V. Riley, which occurred at Chelsea, England in 1843, was held at the museum of the Jefferson National Exposition Memorial exhibit at St. Louis. C. V. Riley (1843–1895) became in many respects the most eminent economic entomologist in the United States and the first entomologist of the United States department of agriculture. He was a systematic entomologist at first. After serving some time as an entomological contributor to the *Prairie Farmer* of Chicago he became state entomologist of Missouri (1868–1877); chairman of the United States Entomological commission (1877–1880); first entomologist of the United States department of agriculture (1878); and founder of the division of entomology, now the bureau of entomology and plant quarantine, United States department of agriculture. He also was responsible for the beginning of the insect collections in the United States National museum by presenting to that institution his own collection as a nucleus. He organized the economic entomologists in North America and was their most prominent and important leader during his lifetime. (E. O. E.)

Epidemics and Public Health Control.

Venereal Disease.—In a report on the activities and objectives of the Chicago Intensive Treatment Center, the authors outlined their case finding methods, and their methods of treating both active and latent cases of syphilis and gonorrhoea. Cases were found by: (1) thorough search for and complete examination of all known contacts of military personnel; (2) routine examination of all groups, such as selective service registrants and court cases; and (3) complete co-operation of the majority of taverns, hotels and industrial groups in searching out, for the health department, suspects of venereal disease.

Treatment of syphilis consisted of: (1) Modified Simpson-Kendell-Rose method, called by them the "Fever-chemotherapy" method. (2) Modified Schoch-Alexander method, called the "Intensive Chemotherapy" method. (3) Modified Eagle-Hogan method, called the "Long Term Intensive Chemotherapy." Mapharsen and bismuth were used.

Gonorrhoea was treated by the sulfonamide method (sulfathiazole for both males and females) and the artificial fever plus sulfonamide method (sulfonamide-resistant methods).

The report was a preliminary one but it outlined the safeguards and precautions to be observed.

Malaria.—Sisk believed there would be an almost certain possibility that troops infected with malaria would return to all sections of the United States. There was expected to be numerous infectious relapses among these men. He showed the need for a resurvey for the potential malaria-spreading mosquito and advised search for both adults and larvae of the Anopheles mosquito by experts.

Talbot advised all military personnel in areas of endemic malaria be examined monthly, using a thick blood smear, and treated vigorously even if there are no symptoms. In general, he treated all men only after symptoms occurred, except those who were in combat zones where all persons who were ill were advised to have prophylactic therapy. He further stated that malaria, like syphilis, might cause symptoms in any part of the body. A positive Wassermann or Kahn test is no criterion of the absence of malaria.

Epidemic Meningitis.—Kuhns, *et al.,* gave 2 to 3 gr. of sulfadiazine daily for 2 to 3 days to some 15,000 soldiers in an outbreak of meningitis. They materially lowered the incidence of the disease. The carrier rate was also lowered.

Epidemic Diarrhoea of the Newborn.—Twyman and Horton reported the use of succinyl sulfathiazole as a specific measure in the treatment of this disease. When combined with opiates, the results were even better. Lembcke, *et al.,* reported on two outbreaks in Syracuse, New York, and advised laboratory controlled methods for sterilizing nipples and formula, good nursing technique, reporting and isolation of cases and immediate epidemiological investigation by a competent person, which usually means an epidemiologist connected with a public health department. (*See* also BACTERIOLOGY; ENTOMOLOGY.)

Estonia. One of the Baltic states of northeastern Europe, north of Latvia, south of Finland, formerly a republic; became part of Germany's "Ostland" (*q.v.*) in 1941. Area, 18,371 sq.mi.; pop. (est. 1939) 1,122,000. Chief towns: Tallinn (capital 146,400); Tartu (60,100); Narva (24,200); Nomme (19,700); Pärnu (21,500). Language, Estonian (a Finno-Ugrian tongue). Religion, Christian (Lutheran 78%, Greek Orthodox 19%). Ruler in 1943: the German reich through Reichscommissar H. Lohse of the Ostland and Commissioner-General Karl Sigismund Litzmann for Estonia. Dr. E. Mae headed a five-man state council.

History.—Estonia's long-feared troubles began with the German invasion of Poland in 1939. In one of her early countermoves, the U.S.S.R. had persuaded Estonia to sign a "treaty of mutual assistance," Sept. 29, 1939. In June of 1940 the Russians occupied the country, in July the people voted to join the soviets, and in Aug. 1940, Estonia became the 16th soviet republic. A tense year of readjustment followed, in which many Estonian leaders were killed or exiled. Then came the German attack on Russia, June 22, 1941, and in the following months the slow nazi conquest of the Baltic. Estonian subjugation was completed only at the very end of 1941. Thereafter only vague and contradictory reports reached the west.

Seemingly the German Balts who were moved out of the country in late 1939 were being returned very slowly, and land re-allotments probably were held in reserve as bribes for aid. Even some of the Russian collectivization was apparently let alone—the soviet reorganization itself had of course but barely got under way. In some cases the German state simply became the collective owner and took for its use crops intended to be distributed among the workers.

Disillusionment and unrest, if not despair, evidently continued to pervade the unfortunate little country in 1943. Libraries were partially destroyed and thoroughly Germanized. Schools and universities were closed or nazified. Brother fought brother, as the Russians announced the noble struggle of their Estonian cohorts and the Germans drafted men of 17 to 45 into Waffen-SS battalions. Rumours came of sabotage and terrorism, mass

arrests and executions. But for what should the Estonian fight? Russian rule had been disappointing; German domination had been devastating. Could this land of one million people dare hope for autonomy? Perhaps the Germans would help Estonia in a new declaration of independence if they themselves were driven out—but obviously only in that case. As for the Russian attitude it became increasingly clear during 1943 that Stalin and his colleagues would demand control of the Baltic littoral as a defense against any future threat from the west. The Moscow and Tehran conferences seemed to give silent confirmation of this decision.

Abroad the Estonians were less vocal than their neighbour peoples, except possibly in Moscow, where each nation was represented by a government-in-exile. Indisputably most things both present and future depended on the outcome of the military conflict raging on all sides of the land. At the close of the year the Russian advances to the south indicated the possibility of a German withdrawal from Estonia.

At the end of 1943 the only available statistics which could give a fair picture were mostly for the period preceding the invasions.

Education.—In 1937–38 there were 1,224 elementary schools, 58 middle schools, 39 technical schools and 30 agricultural schools. Tartu (Dorpat) university had 3,219 students and 217 professors in 1938.

Finance.—The monetary unit is the kroon (26.7 U.S. cents at par). Effects of German monetary changes in 1941–43 were uncertain. Revenue (est. 1939–40) 99,293,000 kroons; expenditure 99,293,000 kroons.

Trade and Communication.—Imports in 1939 totalled 101,351,000 kroons; exports, 118,217,000 kroons. Principal imports were raw cotton, sugar, woollen yarns and thread, iron and steel. Principal exports were butter, wood and paper, cotton goods, cellulose, flax and tow, meat products and eggs. Imports were chiefly from Germany, Great Britain, Sweden, the United States and the U.S.S.R. Exports were chiefly to Great Britain, Germany, Finland, the United States and Sweden. In 1942–43 what trade existed was confined largely to Germany and her satellites, even Sweden being largely cut off.

Agriculture.—Production (in short tons) of the leading crops in 1939 was as follows: rye 250,994, potatoes 963,741, oats 164,684, barley 99,207 and wheat 94,026. Estonia in 1938 had 660,890 cattle, 649,730 sheep, 384,580 pigs, 219,020 horses and 1,596,570 chickens.

Manufacturing and Mineral Production.—Manufacturing production was valued at 166,238,000 kroons in 1937. One of the larger cotton mills in Europe is at Narva, where textile manufactures in 1937 were valued at 47,425,000 kroons. Other important industries are paper and wood, food products, cement, flax, leather. Shale oil production rose rapidly to 209,437 short tons in 1939. Approximately 60,000 people were employed in industry in 1938.

Etching. Within the borders of the countries conquered by nazi Germany, all healthy art growth ceased. Alone among the warring nations of Europe, England carried on. British art organizations held their exhibitions as usual, contributed to by British artists and widely attended by the British public. The Royal Society of Painter-Etchers and Engravers held its annual show in January and, somehow, most of the better-known British printmakers managed to send to it. The same may be said of the graphic arts section of the annual exhibition of the royal academy. Sales were above average.

Turning to the western hemisphere, etching as an independent art medium flourished in the United States. In spite of the fact that many of the best-known etchers were in active military service or in some form of war industry, the work of many of these appeared somewhere in the countless exhibitions held all over the country in 1943. The veteran Frank W. Benson no longer worked in the medium, nor did Harry Wickey nor Kenneth Hayes Miller, to mention two who had outstanding accomplishment to their credit. Franklin T. Wood laid aside his needle, Arthur William Heintzelman's preoccupation with his duties as curator of a great print collection deprived the world of new plates from his hands, and that brilliant performer, John W. Winkler, remained in persistent retirement. Samuel Chamberlain was in military service overseas, Louis C. Rosenberg returned to his first love, architecture, James E. Allen was working largely in the commercial field, and Kerr Eby, as a war correspondent, was drawing the life of the U.S. marines in the Pacific theatre of war. Ill health restricted the output of the veteran etcher and master draughtsman, Mahonri M. Young, and nothing was heard of that other veteran, Herman A. Webster, who made his home in Paris. Sears Gallagher published no new plates in 1943, nor did that exquisite landscapist of the northwest, Helen A. Loggie. But except for these, the better-known names in contemporary American etching carried on. Paul F. Berdanier, Isabel Bishop, Cornelis Botke, John E. Costigan, Ralph Fabri, Eugene Higgins, Robert Fulton Logan, Luigi Lucioni, Roi Partridge, Martin Petersen, Grant Reynard, Ernest D. Roth and George Wright all published new plates in 1943. Among newer names in the field, Theodore Brenson, Kathrin Cawein, Minna Citron, Frank T. Fellner, Isac Friedlander, Harold C. Geyer, Platt Hubbard, Lino S. Lipinsky, Joseph Margulies, Helen Miller, Henry O'Connor and Reynold H. Weidenaar were all active, while of the newest comers must be mentioned the accomplished artists Pasquale Masiello, Stephen Csoka, Karl M. Schultheiss and Helen King Boyer. In the hands of all of these the now well-established tradition of American etching seemed to be safe.

The three oldest print societies, and most influential, continued to be the Society of American Etchers, with headquarters in New York city, the Chicago Society of Etchers, in the middle west, and the Print Makers Society of California, on the west coast. Each of these holds a regular annual exhibition, of national scope, and various travelling exhibitions throughout the year. In addition, the National Academy of Design, in New York city, conducts a great national print show in connection with its annual. The most comprehensive and representative exhibition of contemporary American prints ever brought together, numbering nearly 600 items and covering every branch of the printmaker's art, took place at the Metropolitan museum in New York city early in the year, organized and sponsored by Artists for Victory, Inc., a war emergency organization of artists. The same group was in the closing weeks of the year bringing together by invitation a collection of 50 prints by 50 living American printmakers, to be sent to England in exchange for a corresponding exhibition of British prints to visit this country in 1944.

Meanwhile the etchers and other printmakers of Canada, comprising a comparatively small but active and able group, continued to produce work and hold exhibitions in the face of all the difficulties attendant upon wartime conditions. The Society of Canadian Painter-Etchers continued to be their leading print organization. Central and South American etchers were probably less affected by the war than were those of any other country in the world. But neither in Mexico nor in South America did the copper plate medium attain the degree of development and excellence achieved by lithography and woodcut. (J. T. AR.)

Ethical Culture Movement. A movement in religion started in 1876 by Felix Adler in New York city, and established ten years later in London by Stanton Coit. Societies were active in 1943 in New York city, Brooklyn, Philadelphia, St. Louis and Chicago, and there were four in London, England. The purpose of this innovation was to provide spiritual homes for people of different religious antecedents to whom the profession of traditional creeds was incompatible with intellectual honesty, and to act as a liberalizing influence on other religious bodies by inducing them to accord greater mental liberty to their adherents, and to place the development of ethical knowledge and practice above the study of theological tenets. The principle most emphasized was that of "the independence of ethics," which was cardinal in the Platonic and Aristotelian traditions but had been lost to view during much of the Christian period, although great theologians had at times reasserted it.

The Ethical Culture societies conduct Sunday and week-day services and a variety of educational and social welfare activities. The first social settlement in the United States (the University Settlement in New York city) was an enterprise of the movement, which also originated, in New York and Chicago, the Visiting Nurse associations and the societies providing legal aid for the poor. A considerable literature devoted to vindicating the spiritual nature and dignity of man against the doctrine of human animality has been produced. The movement is experimental and pragmatic in action, though the founder and the majority of the leaders offered reasoned rejections of the pragmatist doctrine in metaphysics. Enterprises of the societies in England and America included sustained efforts for the relief of refugees from European persecution, and their re-education and integration into English-speaking society; also, in 1943, full participation in wartime service activities. The formerly flourishing branches of the movement in Germany and Austria were suppressed by the nazis.

The Standard, edited by George E. O'Dell, is published each month at 2 W. 64th st., New York city. An authoritative exposition of the movement's principles is to be found in two volumes by Felix Adler, *An Ethical Philosophy of Life* and *The Reconstruction of the Spiritual Ideal.* The English Ethical union (president, Lord Snell) had offices in 1943 at Chandos House, Palmer Street, London, S.W.1. (Ho. J. B.)

Ethiopia. A kingdom of northeast Africa. Area, *c.* 350,000 sq.mi.; pop. (est. Dec. 31, 1939) 9,500,000; cap. Addis Ababa; religions: Christian (Copt) and Mohammedan; languages: Amharic and Arabic; ruler: Emperor Haile Selassie.

History.—The emperor's announcement that his country had decided to join the war effort of the United Nations was welcomed by the Allies. The United States extended lend-lease aid to the emperor's government.

The revenue of the empire raised under great postwar difficulties was slender, and export trade was hampered by war conditions abroad. The land tax was halved. Under the agreement and military convention with Great Britain, financial help was provided in the form of quarterly grants over a period of four years. British officers were appointed to the administration as commissioner of police, judges, magistrates, army officers and in leading posts. The educational system was also being reorganized with British assistance, but difficulties were experienced owing to lack of supplies.

The British council opened cultural institutions in Addis Ababa and elsewhere. The council conducted classes and loaned workers to assist in educational work. The Friends ambulance unit, although primarily engaged in medical work in isolated stations, also assisted in educational activities. Plans were being made to deal with the rehabilitation of destitute children and unemployed adults by means of agricultural communities, and the training of boys in units attached to the Ethiopian army. An Ethiopian society entitled Yageur Fekir assisted distressed youths. An industrial school for boys was set up. Medical services under a British director were improving in spite of the shortage of materials and personnel. The social and economic progress of Ethiopia was much hampered by a lack of trained personnel in all the technical services. The internal situation of the country was satisfactory. The British troops had been withdrawn except in places defined in the agreement with Great Britain. The emperor's government set itself the task of reconciling tribal differences. Provincial governors were appointed by the emperor, and ecclesiastical preferments and finance were subject to state control. The emperor's government co-operated with neighbouring territories in an extensive locust campaign. (J. L. K.)

Trade and Communication.—Chief exports: hides and skins, coffee (14,330 short tons in 1937–38) and gold. Roads (1940) *c.* 4,340 mi.; railways (Addis Ababa to Jibuti in French Somaliland) 486 mi.

European Advisory Commission. The establishment of the European Advisory commission was announced in the joint communiqué of the Tripartite conference at Moscow which was published on Nov. 1, 1943. The communiqué stated in this regard "the conference agreed to set up machinery for ensuring the closest cooperation between the three governments in the examination of European questions arising as the war develops. For this purpose the conference decided to establish in London a European Advisory commission to study these questions and to make joint recommendations to the three governments."

The joint communiqué went on to point out that provision was made for continuing when necessary the tripartite consultations of representatives of the three governments in the respective capitals through the existing diplomatic channels. It also announced the establishment of another organization, the Advisory council for matters relating to Italy, to deal "with day to day questions other than military preparations" and to make "recommendations designed to co-ordinate allied policy with regard to Italy."

The European Advisory commission met for the first time on Dec. 15, 1943 at Lancaster House, St. James' Palace, London. The U.S. representative on the commission was Ambassador John G. Winant. The soviet representative was Ambassador Foydor Gousev. The British representative was Sir William Strang, who was until this appointment assistant under secretary of state for foreign affairs of the British foreign office.

Each of the representatives on the commission was assisted by a staff supplied by his own government, and there was to be a joint secretariat made up of personnel designated by the three governments. (H. F. Ms.)

European War: *see* WORLD WAR II.
Events of the Year: *see* CALENDAR OF EVENTS, 1943, pages 1–15.

Ewing, James (1866–1943), U.S. pathologist, was born Dec. 25 in Pittsburgh. He took his A.B., 1888, and his A.M., 1891, from Amherst college and was graduated from the College of Physicians and Surgeons of Columbia university in 1891. He received his early apprenticeship in pathology under American and European authorities and from 1899 to 1932 was professor of pathology at Cornell university medical college. Dr. Ewing was in the forefront of medical spe-

cialists who developed the use of radium in the treatment of cancer. With Dr. James Douglas, he used the Memorial hospital in New York city as a testing ground for his work and was director of the hospital from 1913 to 1939. One of his notable contributions to the literature of cancer was his treatise on tumours, *Neoplastic Diseases*. He was professor of oncology at Cornell medical college, 1932–43, and consulting pathologist at several New York hospitals. He died in New York city, May 16.

Exchange Control and Exchange Rates.

The requirements of economic warfare, not currency defense, shaped the pattern of exchange control in the United States. The general program of foreign funds control changed little during 1943. The assets of all continental European states, China, Japan, Japanese occupied areas and certain individuals and institutions in Latin America remained frozen, and the general and special licensing system for the selected release of these funds was maintained. Only the currencies of Sweden, Switzerland, six sterling countries and Latin-American nations were actively quoted in New York, and most of these were regulated in the home countries. The year 1943, however, marked the development of a financial program in liberated areas, North Africa and Italy, and a modification of the system regulating the real movement of trade by the Foreign Economic administration (formerly Board of Economic Warfare).

The exchange control system of the United States was geared, first, to prevent the enemy from using dollar assets potentially or actually under his control. Even the funds of European neutrals were thus placed under protective freezing. About $8,500,000,000 of blocked funds were held in the U.S. and during 1943 (fiscal year) the treasury received some 238,000 applications for release of assets totalling almost $4,900,000,000, 20% of which were approved. Compared with former years, fewer applications were filed during 1943 and a larger proportion denied.

Second, exchange control was aimed at preventing axis nations from realizing profits on war loot. Hence, the importation of securities and currency was steadily regulated. In the summer of 1943, a further prohibition, effective Aug. 25, 1943, was placed on the importation of checks, bills of exchange and promissory notes from all blocked countries excepting China. The exportation of checks, bills of exchange and currency to these countries was also prohibited in 1943; but the ban on the transfer of foreign-owned property held in the United States, which had been progressively eased since 1942, was further liberalized.

To prevent traffic with the enemy, the treasury also regulated transactions of nationals with individuals and companies included on the "Proclaimed List of Certain Blocked Nationals," and on the unpublished list of "Special Blocked Nationals." Late in 1943, the Banco de la Nacion and the Banco de la Provincia de Buenos Aires, two important semipublic banks in Argentina, were appended to the latter list; shortly thereafter the Argentine government formally announced its intention to repatriate earmarked gold held in the United States.

The military occupation of territories in North Africa and Italy brought new financial responsibilities to the Allied governments in 1943. Controls over finance, property and foreign exchange in liberated areas were found necessary. North African officials, after long negotiations, passed a trading with the enemy ordinance, which introduced a system of selective controls resembling the U.S. program. To guard against the use of frozen dollar assets by collaborationist institutions, a new licensing system was devised for the release of holdings of liberated-areas nationals.

The immediate currency needs of the American and British forces in liberated areas were supplied by the issue of spearhead currencies upon invasion, for which a new, unified occupation money was later substituted. The spearhead currency of the United States, first employed in North Africa in 1942, and during 1943 in the Italian theatre, was the yellow-seal dollar in denominations of $1, $5 and $10 It duplicated the design of the home currency, but a yellow seal was affixed instead of a blue. The British military authorities concurrently issued a special spearhead pound note. The same conversion rates for the yellow-seal dollar and the B.M.A. note were applied in North Africa and Italy, $4=£1.

The use of the familiar local currencies, as soon as military conditions permitted, was preferable. Consequently in 1943 to supplement existing supplies and counteract local shortages or surpluses, a new Allied military lira was jointly issued as legal tender and circulated at par with the local lira. This amlira was to serve primarily as a pocket money currency, and of the eight denominations issued, the maximum had a value equivalent of only $10. Both the amlira and the Italian lira exchanged for the dollar at the official rate of 100 lira=$1 (400 lira=£1). The North African franc, which had been valued in 1942 at 75 fr.=$1 (300 fr.=£1), was appreciated by a half on Feb. 2, 1943 to 50 fr.=$1 (200 fr. =£1). The French Equatorial African franc and that of all colonies under de Gaulle control had previously been valued at the prewar level of 176.6 fr.=£1; thus during 1943 two conflicting franc rates were current in Africa.

Continental Europe.—The Central Clearing office in Berlin and the needs of the nazi war machine continued to dominate the flow of trade and foreign payments on the European continent in 1943. Germany's clearing debts to occupied or controlled countries grew steadily; and mounting pressure by satellite states and European neutrals for a reduction of these debts, coupled with some increase in neutral trading *inter se*, characterized the year.

The major part of satellite states' total trade was transacted with Germany, the remainder with other nations in the nazi orbit, and with the possible exception of Finland, Norway and Slovakia, exports to Germany exceeded imports. Most of the trade and clearing agreements prevailing in 1942 among the 20 states associated with the new order economic system were renewed with minor modifications during the first half of 1943. Seventeen of these countries utilized the Central Clearing office in Berlin for most of their international payments, the exceptions being Spain, Portugal and Turkey. France dealt with Belgium, the Netherlands and Norway through Berlin but concluded transactions with all other countries directly. Norway dealt directly with only Sweden and Denmark; and even the two unoccupied countries, Bulgaria and Rumania, cleared mutual payments through the Berlin central office.

Germany, unlike Japan, maintained stable exchange rates for most foreign currencies during the year, the last rates fixed in 1942 prevailing in 1943. Apart from direct confiscation, Germany managed to finance the large volume of excess foreign purchases and maintain stable rates, primarily by accumulating clearing debts in exporting countries. These debts were offset somewhat by limited exports of German goods. The occupation-costs levy was another device for securing additional local credit, since occupation charges were generally met by advances from the central bank in the occupied country.

The Kassenscheine, a military currency, which was issued by the Reich Credit offices for army purchases, exchanging for local currencies at fixed rates, during 1943, circulated in certain occupied areas of the U.S.S.R. and in northern Italy, where the lira rate was depreciated from 7.6 lire=1 r.m. to 10 lire=1 r.m. The yen-lira rate was similarly revised from 22.35 yen=100 lire to

17 yen=100 lire.

Pressure for the reduction of Germany's swollen clearing deficits gave rise to several schemes for partial repayment. In the spring of 1943, Hungary's debts in France were assumed by Germany, an equivalent amount being charged off the nazi clearing deficit. Rumania repatriated part of its public debt with a portion of its Berlin clearing claim. Most countries associated with the nazi clearing system provided local facilities for the rediscount of exporters' frozen claims. Export trade was made somewhat less attractive in Belgium with a new regulation that 30% of all commodity-accounts claims were to be paid in blocked treasury bills.

Among the neutral countries, Turkey during 1943 was the smallest participant in German Europe's trade. Agreements concluded with the nazi family of nations were little more than isolated barter pledges, generally providing for the shipment of German goods prior to the execution of Turkish sales. Controls over income to foreigners from Turkish property were tightened.

Spain and Portugal, exporters of products sought by both groups of belligerents, were also able to exact more favourable terms of payment from Germany. Germany, followed by the United Kingdom and Switzerland, was the largest participant in Spain's foreign trade; nevertheless, Spain's clearing claim on Berlin was relatively small. In March 1943, the Spanish system of foreign trade control was revised; the Banco Exterieur de España was granted a monopoly on the issue of all import or export permits, the government being assigned a portion of the profits arising therefrom. During February, Portugal and Spain concluded new bilateral trade and payments agreements aiming at a higher degree of self-sufficiency for the Iberian peninsula.

Both Sweden and Switzerland, during 1943, had close dealings with the nazi clearing sphere. German shipments to Sweden fell short of expectations; the Swedish government therewith limited the granting of credit guarantees on frozen claims to exporters. Moreover, Sweden refused to accept German gold and in negotiating 1944 agreements, made demands for anticipatory payments. Switzerland's clearing agreement with Germany expired on Jan. 15, 1943, and only after long negotiations was renewed late in the year. In the interim, a *de facto* clearing system for a limited volume of trade was maintained, and the federal guarantee on clearing claims lapsed. The standstill credit agreement with Germany was renewed for June 11, 1943–May 31, 1944, with new provisions for the progressive liquidation of arrears; and a trade agreement which more closely approached bilaterally balanced exchange was ultimately concluded for the period of Oct. 11 to Dec. 31, 1943. New or revised trade and payments treaties were also made with Spain, Portugal, Hungary and Bulgaria.

Latin America.—Almost every Latin-American country during 1943 was exporting more than it could import, facing serious inflationary problems and accumulating large foreign balances. Argentina's balance of trade and payments positions were extremely favourable, and large volumes of refugee funds exaggerated the size of the capital inflow. Consequently, by April 20, after three weeks of violent fluctuation, the free peso rate in Buenos Aires rose to $.2506, the highest level in more than four years. Moreover, the central bank simultaneously lowered its official buying rate for exchange arising from nonregular exports from 4.2182 to 3.9702 pesos to the dollar. The decree of April 20 empowered the ministry of finance to control all foreign capital movements and prohibited the inflow of floating funds seeking temporary refuge in Argentina. Productive capital for genuine long-term investment was granted entrance. The decree of Sept. 17 provided for the repatriation of a large block of sterling obligations, about £33,000,000 out of a total sterling indebtedness of some £39,000,000.

In Brazil, the mounting accumulation of dollar and sterling assets, because of a favourable balance of trade, provided the basis for a compensation agreement with the United Kingdom with respect to blocked cruzeiro balances—frozen liabilities which had been contracted under the milreis monetary regime. Under a new agreement, during November, with foreign owners of public obligations, it was possible for the Brazilian government to grant more favourable terms to creditors than in the previous debt plan (expiring March 1944). To prevent entry of axis funds, the

Latin-American Exchange Rates*

Averages are based on actual selling rates for sight drafts on New York, in units of the foreign currency per dollar, with the following exception: Cuba—United States dollars to the peso. The peso of the Dominican Republic, the Guatemalan quetzal and the Panamanian balboa are linked to the dollar at 1 to 1; the Haitian gourde is fixed at 5 gourdes to the dollar.

*Source: U.S. Department of Commerce, *Foreign Commerce Weekly*, Oct. 30, Dec. 4, Dec. 18, 1943. †Special rates apply to automotive equipment and agricultural machinery imported from the United States into Argentina. ‡After Nov. 1, 1942, exchange quotations have been expressed in terms of cruzeiros and centavos to the dollar, which under the Brazilian law of Oct. 6, 1942, replaced the milreis as the official monetary unit. §Established Mar. 25. ‖In 1941 and 1942, for Class 2 merchandise, 1.795; Class 3, 1.87; Class 4, 1.195. During 1943, for Class 2 merchandise, 1.765; Class 3, 1.775; Class 4, 1.785. ¶Data not received. ⁰July 24–Dec. 31.

Bank of Brazil under its exchange control authority imposed new, rigid restrictions on the import and export of paper currency, prohibiting all unauthorized movement. In September, the special free rate for dollars was reduced to 20.30 cruzeiros.

At the close of 1942, the Colombian Office of Exchange and Export Control set up a new semiflexible procedure for the discount of foreign drafts by the Bank of the Republic whereby exchange originating in certain transactions was partially purchased with national economic defense bonds, and not entirely with cash. To stabilize the prevailing exchange rate and to curb inflation, the central bank was also authorized in June, 1943, to sell nonnegotiable certificates of deposit bearing a two-year maturity and an optional backing of gold or dollars. The ministry of finance was required to authorize any new capital imports. On April 7, the export control office lowered the rates applicable to import payments made through the Stabilization fund. (*See* table, footnote 11.)

Mexico also recorded a net export surplus in 1943 and, in contrast with former years, a great influx of foreign capital. With inflation and expanded currency needs, Mexico suspended silver sales abroad early in the year and even suggested a possible lend-lease silver grant. On Aug. 16, however, the finance ministry announced the projected renewal of shipments in April 1944. The government, in July, launched a new $40,000,000 defense loan to finance the acquisition of exchange from the central bank for the redemption of foreign obligations.

In Paraguay, the Exchange Control law of 1941 was revised; the new law of Feb. 18, 1943, tightened controls governing the possession of foreign exchange. It also set up an exchange fund to finance the repurchase of foreign-owned enterprises in Paraguay and established two selling rates for foreign drafts, distinguishing between necessary and nonessential imports. Formally unable to convert foreign exchange holdings into a true gold reserve, the Bank of the Republic on Sept. 13 was empowered to buy and sell gold bullion or coin. A new currency, the guarani, was established on Oct. 5, gradually replacing the former paper peso at the rate of 1 guarani = 100 pesos. An innovation in monetary standards, its value was not set in terms of gold or of dollars exclusively but rather linked to the several currencies of the countries important in its balance of payments.

Unlike most other Latin-American countries, Uruguay evidenced a shortage of foreign exchange early in 1943; in later months, however, the balance of payments shifted and pressure on prevailing rates was eased. In September, after the political upheaval in Argentina, some "scare" capital flowed into Uruguay. The dollar-buying rate of the central bank of Ecuador was lowered to 13.50 sucres in July; the curb rate in Chile dropped markedly in the middle of the year and in Bolivia declined steadily throughout the year. At the end of March, to relieve a coin shortage, Honduras utilized dollar exchange for the purchase of some $1,500,000 in 50- and 10-cent pieces from the United States; Cuba bought gold as backing for a new currency.

United Kingdom.—Although no major change was introduced during 1943 into the United Kingdom's exchange control system, the program was somewhat liberalized to simplify administration and to reduce the volume of accumulated debts. Four major types of accounts for foreign creditors—registered, special, sterling area and Central American—were maintained. Early in 1943, however, the regulations governing the sterling holdings of U.S. residents were simplified. Since July 1940, most U.S. funds had been held in three categories of accounts: registered, representing sterling freely convertible into dollars at the official rate and applying principally to new money held on behalf of American banks; sterling area accounts, held for individuals having certain periodic payments to make to the United Kingdom; and, least common, old or free prewar accounts, which were in existence prior to the institution of controls in 1940 and used for discharging equally old obligations, convertible at the free market rate. On Feb. 2, all categories were merged under the heading registered accounts. A similar ruling applicable to the holdings of Central American residents was also issued; on Aug. 25, old sterling accounts for this area were redesignated Central American accounts.

Unaffected by these regulations were the blocked funds of American film companies held in a special account and blocked accounts maintained for U.S. residents representing the proceeds of the liquidation of certain capital assets. However, all special restrictions on the remittance of film royalties were removed in May (retroactive to Oct. 25, 1942); thereafter, such transactions were subject only to customary regulations on all transfers abroad. Measures relating to the accumulation and use of funds arising from capital transactions and held on blocked account were also liberalized. In fact, a major portion of these realized capital balances, frozen since Nov. 1940, were by a retroactive order in October released for transfer. The United States was the principal beneficiary under this new ruling, since the release was not extended to the funds of Canada, Newfoundland, Switzerland and Argentina. In addition, a more lenient policy was adopted on the sale and purchase of sterling securities by nonresidents; the ban on the acquisition of bearer securities was also lifted.

Among the other developments in 1943, three franc currencies —Algerian, French Moroccan, French West African—were added to the designated list of currencies which residents were required to offer to the Bank of England. The list released at that time also included the currencies of eight countries in the western hemisphere and three in Europe. Procedure on interest and dividend payments and capital repayments credited to Sweden or Switzerland was tightened. The Anglo-Italian payments system was revised on Oct. 8; use of the Anglo-Italian Clearing office was thereafter reserved for debts contracted prior to that date. Lastly, the United Kingdom participated with the United States in exchange control and monetary programs in liberated areas and other areas.

Other Areas.—Even at the beginning of 1943, the sterling assets of British empire and other sterling bloc countries had reached nearly £600,000,000. India was probably the largest creditor despite repatriations of sterling loans during 1943 with part of these funds. Inflation was rampant in India, Egypt and other Middle East countries, and gold was imported in a partial attempt to mop up excess purchasing power resulting from Allied expenditures. At the request of the Egyptian government, gold was supplied by Britain and sold to the public in the form of small 18.69 dirhem bars (about 2 oz.) of .996 fineness at 177.3 piastres per dirhem. On April 11, the following exchange rates were set: 100 Egyptian pounds = 5.524 Norwegian crowns, 12.948 Dutch florins, .815 Belgian francs, .552 French francs, .186 Greek drachmas. These rates were applied to pre-occupation obligations which cleared through the Office of Occupied or Controlled Territories. In May, all foreign exchange transactions in Afghanistan were centralized in the Bank of Afghanistan (Bank Shahi). By December, the influx of Indian funds had risen so greatly that the bank reduced its official rupee-buying rate. The dollar rate was lowered on Oct. 13 from $1 = 13.0472 afghanis to $1 = 11.5528 but soon after returned to its former value.

Australian sterling holdings were high, about £60,000,000 at the beginning of 1943, and dollar funds from the expenditure of American troops in the Pacific also plentiful. The commonwealth, however, maintained only a small dollar reserve, remitting the remainder to Britain. The prohibition on the unlicensed import

of gold into Canada was extended to the end of the year. The Canadian Foreign Exchange Control board was granted the power to declare bankrupt nonresident persons or firms attempting to evade prosecution or investigation under the Foreign Exchange Control order. All gifts under $25, however, were freed from exchange restrictions.

Exchange conditions in the orient during 1943 were chaotic, under the reign of the twin devils inflation and depreciation. Prices and note circulation had risen tremendously in China; nevertheless the official rate, Ch. $20=U.S. $1, was maintained with a special rate of 30=1 for diplomatic, educational, missionary and certain other transfers. From all indications, including the black market rate of U.S. $1=Ch. $80–$90, with unpegged exchange, the currency would have fallen precipitously. In May, to check the efflux of precious metals, unlicensed exports of gold and silver were prohibited. A month later a ruling permitting private trading in gold was issued. Ostensibly to bolster the falling currency, $200,000,000 in gold bullion was purchased from the United States with part of the $500,000,000 stabilization loan granted China in 1942. The Bank of Japan remained the central clearing agency in the Japanese sphere and the military yen the dominant currency. Japan had depreciated the currencies of occupied territories, mostly to parity with the yen. Unlike Germany, Tokyo made no attempt or even promises to nominally stabilize rates in most areas, and by 1943 satellite currencies had fallen relatively lower than in continental Europe. Exchange Stabilization Funds.

Exchange stabilization funds during 1943 were relatively inactive. In Europe, war and strict economic controls completely paralyzed the operations of such funds. In most Latin-American countries, surplus exchange holdings limited the need for a vigorous stabilization policy to support currencies.

The role of the U.S. Stabilization fund in controlling foreign exchange values was diminished in 1943. However, several agreements with small nations for the purpose of stabilizing exchange rates were renewed. The agreement in which the United States undertook to sell gold to Cuba in maximum installments of $5,000,000 was extended to June 30, 1945. In the first half of 1943, a credit slightly exceeding $5,000,000 was granted Cuba by the U.S. Stabilization fund. During the same period, the fund increased its holdings of Swiss francs by more than $500,000. On June 30, stabilization agreements with Ecuador and Iceland were renewed for one year and the Mexican accord extended for two years. The maximum sums which the United States was obliged to purchase were: $5,000,000 in Ecuadoran sucres; $2,000,000 in Icelandic krónur; $40,000,000 in Mexican pesos. Later in the year, an agreement with Brazil, like the Cuban accord, specifically endorsed the sale of gold. Perhaps the most outstanding event of 1943 was the passage of a bill in April extending the life of the $2,000,000,000 Stabilization fund to June 30, 1945. At the same time, the president's power to devalue the gold content of the dollar was revoked, and the act specifically forbade the transfer of the gold holdings to any international stabilization fund without the consent of congress.

In April, draft outlines of proposals for an international stabilization fund and an international clearing union were made public by treasury experts in the United States and the United Kingdom, respectively. The Canadian ministry of finance released another proposal for an international exchange union in July. Experts from various countries participated in discussions relative to these plans throughout the year; the U.S. treasury officials conferred with representatives of approximately 30 nations. The future establishment of any such international stabilization or clearing system would, in all likelihood, strip the national stabilization funds of their functions. (*See* also EXCHANGE CONTROL AND EXCHANGE RATES; GOLD.) (D. B. B.)

Expenditure, Government: *see* BUDGET, NATIONAL.

Export-Import Bank of Washington.

The Export-Import Bank of Washington, an agency of the United States, was established on Feb. 12, 1934, for the purpose of financing and facilitating trade relations between the United States, its territories, insular possessions and foreign countries. By an act of congress approved Sept. 26, 1940, the Export-Import bank was to continue as an agency of the United States until Jan. 22, 1947, or such earlier date as might be fixed by the president by executive order. By this act it was also granted specific authority to make loans which would assist in the development of the resources, in the stabilization of the economies, and in the orderly marketing of the products of the countries of the western hemisphere.

The bank in 1943 had lending authority of $700,000,000. Its capital consisted of $1,000,000 of common stock and $174,000,000 of preferred stock. All common stock, except 11 shares standing in the respective names of the trustees, was held jointly by the secretaries of state and commerce in their official capacities. All of the preferred stock was purchased by the Reconstruction Finance corporation. Its governing body was a board of 11 trustees of which the chairman was the foreign economic administrator and on which were represented the departments of state, treasury, commerce and agriculture and the Reconstruction Finance corporation.

From its creation to the end of 1943, the bank had authorized $1,164,948,061 of loans compared with $1,101,761,946 at the close of 1942. During the year 1943, disbursements amounted to $55,687,885 and repayments to $32,250,352. As a result, outstanding loans at the end of 1943 were $204,937,874 compared with $181,500,341 at the end of the previous year.

Although the operations of the bank in behalf of United States foreign trade had been world-wide, circumstances restricted them following the outbreak of World War II almost entirely to the western hemisphere, and particularly to the making of loans to develop resources vital to the war effort. Because of transportation difficulties and other wartime impediments to foreign trade, the bank also continued during 1943 its plan for underwriting letters of credit of approved foreign banks which were opened in the United States by U.S. commercial banks, thus helping to preserve long-established markets and trade channels to the extent possible under wartime conditions. Eye, Diseases of.

Experiments conducted by Bellows and Gutmann with the use of sulfonamides in treatment of intraocular inflammation resulted in a simple method of obtaining chemotherapeutically effective levels of the sulfonamide compounds for combating infection of the anterior segment of the eyeball by the application of the drug in the presence of a suitable wetting agent.

It was shown that the sulfonamide compounds, with the excep-

tion of sulfanilamide, penetrate the cornea poorly. Further, the concentrations reached in the ocular tissues and fluids when other of the sulfonamides are administered orally or locally fall short of the values necessary for therapeutic effectiveness.

A wetting agent is defined as a substance which, by lowering interfacial tension, increases penetration and acts as a detergent or emulsifying agent, bringing about an increased penetration of both the wetting agent and other substances which by themselves would not penetrate readily. The sulfonamide compounds employed were sulfanilamide, sulfathiazole, sulfadiazine and sulfapyridine. The wetting agents used were:

Aerosol OT	Tergital O8	Sodium lauryl sulfate
Aerosol OS	Ocenol KD	Zephiran
Tergital 4, 7		

All the wetting agents caused a definite increase in the concentration of the sulfonamide compounds in the aqueous humor, so that they reached a point above that considered necessary for chemotherapeutic effectiveness. By application of heat the concentration of the drug in the aqueous humor of the eyes was increased threefold.

The sulfonamide compounds, however, have an unfavourable effect on actively growing epithelium, as shown by a greater than twofold increase in the time required for epithelial regeneration. They increase the amount of scarring. Therefore, the local use of these drugs should be avoided in the treatment of injuries of the face or cornea.

Industrial Hazards.—The eyes of welders are, supposedly, fully protected from the dangerous actinic rays of either gas flame or electric arc. Is there, in spite of this protection, a depletion of visual purple that might retard adaptation to differences in brightness?

Sixty-one welders were given tests for speed of dark adaptation before and after a day's work. Thirty-nine were on the day shift and 22 on the night shift. Half the welders (31) each received 10,000 units of vitamin A before starting work and again in the middle of the shift. Other welders received a placebo at the same time. There was in 1943 no evidence of a general lack of dark adaptation among welders and no evidence of any decrement in this function during an 8-hour shift. Individual differences in age, domicile, type of goggles and food showed no relation to differences in gain or loss of speed of dark adaptation during an 8-hour shift. The clinical conclusion was that the excessive number of complaints among welders was due to inadequate protective equipment or carelessness in its use. (*See* also VITAMINS.)

Falk Foundation, The Maurice and Laura,

of Pittsburgh, Pa. continued during 1943 to devote its funds to the financing of definitive research investigations of specific economic problems basic to the development of U.S. industry, trade and finance, but with special emphasis on problems of postwar readjustment and economic reconstruction. Grants voted in 1943 totalled $152,166.67 and included $75,000 to the Brookings institution, Washington, D.C. for sequential studies to analyses of economic problems made under the foundation's grants of previous years. Special wartime out-of-program grants included $16,500 to the United War fund and $4,000 to the American Red Cross. Payments in 1943 on grants made in 1943 and earlier years totalled $177,166.67 and included $30,000 to the Brookings institution, for studies of demobilization and economic reconstruction; $22,500 to the National Bureau of Economic Research, New York, for statistical analyses of trends in the service industries; and $50,000 to the Carnegie Institute of Technology on a $300,000 endowment grant for the Maurice Falk Professorship of Social Relations.

In 1943 the following publications were issued as reports on studies made under the foundation's grants: *Collapse or Boom at the End of the War?* (Brookings Institution); *Do We Want a Federal Sales Tax?* (Brookings Institution); *The New Philosophy of Public Debt* (Brookings Institution); *Basic Criteria of Price Policy* (Brookings Institution); *American Agriculture, 1899–1939* (National Bureau of Economic Research); and *Employment in Manufacturing, 1899–1939* (National Bureau of Economic Research). Famines.

The famine in Bengal, India was the most severe in 1943 with the other in China of almost equal proportions. Both of these disasters were to some extent due to conditions caused by World War II, partly the result of crop failure, inadequate transportation and changing government policies.

In Bengal, the food shortage had been growing steadily with the increase of population without a corresponding increase in food production. During the period 1933–43, population increased about 50,000,000 while at the same time the per capita yield of rice declined and the pressure on the land increased in the same proportion. In some districts there were over 2,000 persons per square mile in rural villages, most of them living on the extreme margin of subsistence. In 1942, the rice crop of Bengal was seriously damaged by a cyclone and floods and an unusual scarcity could be foreseen. Prices began to rise because of a fear of Japanese invasion. Peasants who grew a surplus for market found themselves able to meet their obligations with a smaller part of their crop and began hoarding the remainder through fear of the future. This aggravated the shortage in the cities and villages and the poor classes, already living on a subsistence margin with shrinking income, were rendered destitute. Statistics of agriculture and health are very inadequate in India; official estimates placed the number affected at about 7,000,000 but reliable data on the actual number of deaths were not available at the end of the year. Estimates ranged from 250,000 to 1,000,000 for Bengal alone. In Calcutta alone, more than 150,000 were reported destitute.

The Central India government made special efforts to increase the 1942–43 rice crop and the area was reported to be the largest of the period 1933–43. A low yield of 24.5 bu. per acre resulted from drought in parts of the country, bringing the 1943 crop to 1,834,000,000 bu. compared with 1,895,000,000 in 1942.

While the second largest rice producer, India was usually the largest importer, bringing in about 3,000,000,000 lb. yearly, 80% of it from Burma and the rest from Thailand and Indo-China. With these sources cut off by the Japanese invasion the shortage had to be made up by other grains, principally wheat from Australia.

The Central government of India as well as the Bengal government increased shipments of rice and other grains to the stricken regions. In six months about 475,000 tons were shipped to Bengal alone. In Bengal, 5,500 free food kitchens were set up by the government and served over 2,000,000 persons daily. Sufficient supplies were said to be in sight to carry through until

the new rice crop became available in December. To prevent a repetition of the famine in 1944, the government sought ships with which to bring wheat from Australia. At the All India Food conference plans were made by the government to introduce rationing in Punjab, the bread basket of India, to make available larger quantities of grains to be shipped to the provinces of shortages. The food conference agreed to a general supervision of the distribution of grains and other foodstuffs.

In China, the suffering was most acute in those provinces, Kwangtung and Honan, which formerly depended on rice from Thailand, Indo-China and Burma which were, in 1943, cut off. The invasion by the Japanese of the "rice bowl" area around Tungting lake produced another serious shortage. Late in 1943, however, the Chinese armies had successes in this region and regained much of the best producing area.

The 1942 and 1943 rice crops in Free China, which represented about two-thirds of total Chinese production, were about normal but little surplus was available for distribution to areas where the 1943 crop was short. Several areas harvested poor crops in 1943 and therefore faced famine or near-famine conditions. Lack of transportation facilities and the prior claims of military needs were the principal factors handicapping relief efforts. Official figures were not available for China but best estimates put the total of the Chinese crop in prewar 1930–35 at 2,300,000,000 bu., which was about 500,000,000 bu. more than the production of India and about one-third of the world's total. Farm Credit: *see* FARM CREDIT ADMINISTRATION.

Farm Credit Administration.

Highlighting the Farm Credit administration's activities in 1943 were an accelerated demand for production credit, an increased amount of credit extended to finance the war-expanded operations of farmers' co-operatives, and large repayments on the principal of outstanding farm mortgage loans.

Credit extended to farmers and their co-operative associations through the facilities of the Farm Credit administration totalled $1,186,092,658 in 1943, compared to $964,552,979 in 1942.

About 50% of this amount, or $593,735,184, was short-term credit used to finance the production of crops and livestock, including a number of new crops.

Short-term production credit totalling $501,211,688 was extended by 529 production credit associations, $19,269,945 by the 11 emergency crop and feed loan offices, and $73,253,551 by the Regional Agricultural Credit corporation of Washington, D.C. RACC loans were authorized early in 1943 to finance farmers producing needed war food, fibre and oil-bearing crops.

Farmers' co-operatives used credit from the 13 banks for co-operatives amounting to $398,581,320, an increase of 58% over 1942. Much of this credit was used in processing and preparing for shipment food vital to the war effort.

The loans and discounts for the 12 federal intermediate credit banks totalled $927,435,580 for 1943. While not loaning directly to farmers, these banks provided loan funds for 529 production credit associations, advanced funds to the banks for co-operatives to carry the major part of their commodity loans, made agricultural loans to and discounted loans for privately capitalized financing institutions, and made direct loans to co-operatives.

Long-term farm mortgage loans closed by the 12 federal land banks and the Federal Farm Mortgage corporation in 1943 amounted to $92,397,244 compared to $82,508,218 in 1942. Despite an increase in the amount of new credit extended loans outstanding continued to decline because of large principal repayments. On Dec. 31, 1943, outstanding loans totalled $1,764,127,623 compared to $2,115,043,460 on the same date in 1942.

The Farm Credit administration through its 12 district offices and local associations continued to urge farmer-borrowers to use their increased income to buy war bonds, to pay off debts, or to make provision for future instalments of Federal land bank and Commissioner loans by putting money in the Future Payment funds of the 12 land banks and Federal Farm Mortgage corporation. Money in these funds amounted to $25,723,247 on Dec. 31, 1943, compared to $17,701,767 in 1942. Repayments on the principal of Federal land bank and Commissioner loans totalled $427,119,112, or 41% more than in 1942. (A. G. BL.)

Fascism.

The year of 1943 marked definitely the turning point in the fortunes of fascism as a movement of international importance and in all probability sealed its world-wide decline. In Oct. 1942 fascism had celebrated the 20th anniversary of its triumphant coming to power in Italy under Mussolini's leadership. In these 20 years fascism had established itself in Germany, Japan, Spain, France, Hungary, Rumania, Bulgaria, Slovakia, Croatia and had exercised its influence in some Latin American countries, especially in Argentina, and before World War II also in Poland and Greece. Fascism had always boasted of its superiority compared with "obsolete" and "decadent" democracy, of its higher efficiency and military invincibility. The events of 1943 proved definitely that, in spite of its many years of preparation and its supreme efforts at total mobilization, fascism was surpassed in the course of only a few years by the democracies in the field of industrial efficiency and war strategy. In 1943 fascism was put everywhere on the defensive. The only point on the globe where it made definite gains was Argentina.

The greatest blow to the prestige and influence of fascism was delivered on July 25, 1943, when in the land of its first triumph the king of Italy dismissed Benito Mussolini and appointed Marshal Pietro Badoglio as prime minister. The whole structure of fascism collapsed with incredible ease and speed. On July 28 the dissolution of the fascist party and the abolition of the special fascist tribunals for the defense of the state were decreed. The official announcement over the Italian radio declared that "Italy has found it necessary to rid herself of a political system that she found harmful to the nation; this political system has been done away with. Fascism in Italy is over, forever." The overthrow of fascism in Italy was the result of a revolt within the highest ranks of the fascist party against the leadership of Mussolini. The difficult and almost chaotic situation in which Italy found herself as a result of 20 years of fascist administration and of fascist aggression was made clear already at the beginning of July, when against widespread criticism and unrest Mussolini declared that Italy must stand with the fascist axis or sink to the rank of an insignificant power. He warned then already that the Italians must not make scapegoats of the fascist bureaucracy and threatened the most draconic measures against all who would undermine fascist and Italian morale. But this morale had been destroyed and corrupted by 20 years of fascist regime, and thus the end of fascism in Italy was joyously welcomed by the Italian people and the promise of a clean sweep of the Italian national life from all traces of the fascist regime was given by the new Italian government.

The Germans, in occupying northern and central Italy, succeeded in rescuing Mussolini who had been imprisoned by the Italian government. On Sept. 15, 1943 Mussolini again "assumed

the supreme leadership of fascism in Italy." He appointed Alessandro Pavolini provisional secretary of the fascist national party, which was now renamed Republican Fascist party, thus expressing the party's new hostility to the king and the House of Savoy. A new fascist Italian cabinet was set up, but this new cabinet never exercised any actual authority which was entirely in the hands of the German army of occupation.

The downfall of fascism in Italy made a great impression in the smaller fascist satellite nations, in Hungary, Bulgaria, Rumania, Slovakia and Croatia. In all these countries the opposition to fascism grew, and the governmental circles themselves were reported reliably to be on the lookout for some form of compromise to avoid the debacle involved in the expected victory of the democracies. It was only in Spain that the fascist regime of General Franco, backed by the fascist party, the Falange, showed no sign of weakening. The Falange was active in promoting fascist ideas in Latin America, where they found a fertile field in Argentina. The new government of General Ramirez, who came to power in June 1943 as a result of an army revolt, not only refused to break Argentina's ties with the axis, but went much further than its predecessor in the suppression of all democratic liberty in the country. The policy of the government was anti-American, and Argentina tried to win over neighbouring Latin American republics for a common pro-Fascist policy. While thus the influence of fascism grew in South America and came daringly more into the open, fascism suffered a definite set-back in South Africa. The very strong fascist groups, which from the beginning had opposed South African participation in the war and were violently hostile to Britain, united under Dr. D. F. Malan, but were heavily defeated in the elections of July 1943, when the democratic parties under the leadership of Fieldmarshal Jan Christian Smuts gained in "the most spectacular victory in the history of South Africa" a majority of 64 seats as against 13 voices with which Smuts had carried in Sept. 1939 his declaration of war against the then much stronger pro-fascist opposition. This defeat of the fascist party in South Africa, perhaps the strongest and most effective fascist party in any democracy, coming only a very few days after Mussolini's downfall and the liquidation of fascism in Italy, confirmed the general trend towards democracy in the world, to which Argentina formed the only exception.

In the great democracies fascist propaganda tried to carry on ceaselessly its activities for undermining the democratic powers. The main lines of this propaganda remained unchanged: they played in America upon prejudices against the British Empire and in Britain upon the apprehension of an expanding American imperialism, in both countries upon the fear of communism and especially upon the dislike of Jews. By a dexterous use of insinuations, distortions and emotional appeal to prejudices fascist propaganda was to a certain degree successful in its efforts to confuse and disunite the democracies. In Great Britain its influence was, however, so much on the decline that the government could release from prison in Nov. 1943 the British fascist leader, Sir Oswald Mosley. Mosley, who had been confined since 1940, was freed because of ill health. His release provoked widespread protests on the part of labour. Fashion and Dress.

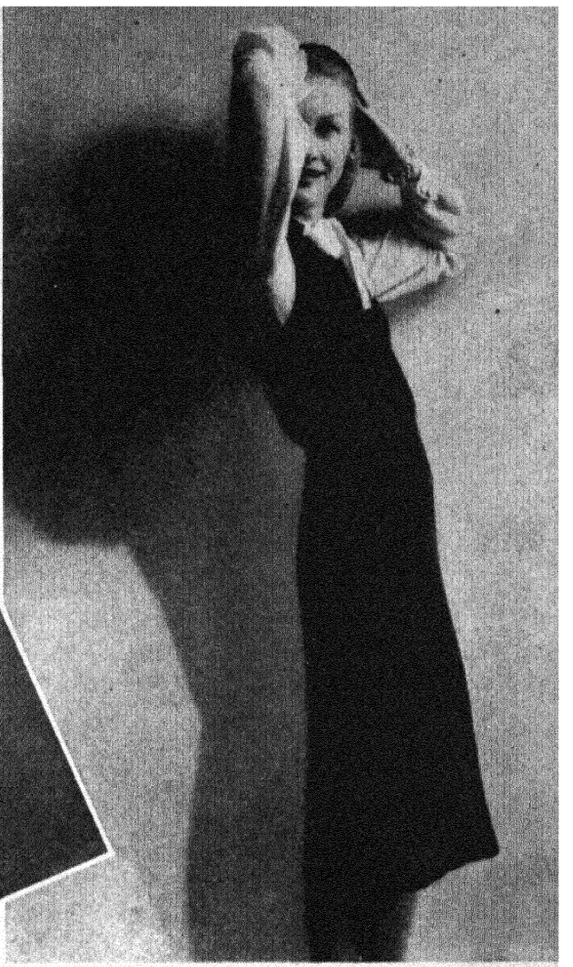
During 1943, American fashion began to show a momentum of its own, an honest freedom from the great tradition of Paris on which it had leaned so heavily, so long. Clothes were at once less cautious and less tricky. Still marked by the simplicity that wartime fabric shortages and the wartime work and psychology of women demanded, the simplicity was tempered by inventiveness of cut, a genuine suppleness of line.

Two very distinct silhouettes emerged over the year. One was tubular, slim, reedy, exemplified in straight chemise dresses cinched in at the waist by belt, not fit; in knitted dresses that pulled on over the figure like knee-length sweaters. The other silhouette was chunky, bulky, giving the effect of fullness without gathers—robust boxcoats in wool or fur, or wool lined in fur; wool dresses cut with the generosity of officers' greatcoats, then decisively belted in.

With either silhouette, the look of the head was decidedly neat and small, the hair folded up off the ears and moored on top of the head, netted neatly at the back of the neck, or twisted in tight neat braids. Hats fitted close to the skull—little felt caps, coifs bound tight around the hairline, wide bands of material (called "curvettes") worn over the top of the head and tied under the hair in back with strings of felt or velvet ribbon. This curvette was the most popular headpiece (it could scarcely be called a hat) of the young. It was seen in every material—felt, fur, crocheted wool flecked with coloured sequins for the evening. Many secured their hair in simple snoods of veiling anchored on the head by a band of ribbon.

Suits, still the most popular single fashion because of their enormous versatility, grew sophisticated, even flippant, in cut at no sacrifice of functional usefulness. The straight, spare skirt was broken across the front by soft trouser pleats, and a new hike-back skirt appeared—still straight in front, but hiked up slightly in back to make it swing out gracefully behind. The suit jacket grew shorter—and niftier. Three jackets in particular marked a development: (a) the short, fitted jacket, nipped in snugly at the waist, slightly flared out over the hipbones; (b) the bolero, fitted close to the lines of the figure after the authentic Spanish fashion; (c) the box jacket, extremely young and casual, its squared-off, sawed-off lines accentuating the slimness of the skirt.



Long coats adapted from officers' greatcoats, and short coats adapted from seamen's jackets, were seen everywhere—practical, dashing, adaptable; but it was the fur-lined coat, launched in the autumn, that became the big news of winter. Simple tweed reefers, loose box coats, slim mid-length tuxedo coats all wore fur linings. Even the raincoat made a welcome fur-lined appearance, gave women an opportunity to be warm in any weather.

The younger generation made almost a uniform of the pinafore or jumper dress, perfect in cottons for summer; and—in gray flannel, checked tweed, or bright wool jersey—a wonderful campus costume worn with any of many shirts and blouses. A few of the more daring began to couple the pinafore with an adaptation of the ballet dancer's leotard: waist-length tights and a separate crew-neck shirt of striped or figured wool jersey. This basic outfit dispensed with stockings and most underclothing, and over it a pinafore or simple wrap-on skirt completed a whole costume.

After several years of covered-up necklines for both day and evening, décolletage came back in fashion. It was first seen during the summer in gingham beach dresses with shoulder-strap tops, and in printed silk town dresses with matching jackets to cover their backless, sleeveless nakedness on the street. By winter, 1943, the covered-up, short-skirted dinner dress of 1942 had become a full-fledged, décolleté evening dress: short black slipper satin dresses with ribbons of satin over bare shoulders; halter tops of white satin and sequins barbarically strapping naked backs above simple short black crepe skirts; short black crepe dresses with deep oval décolletage and tiny cap sleeves (a fashion stemming from the blouse of Mexican women) dangerously edged in black lace. Almost all these décolleté dresses

SEAMAN JACKETS with handjamming pockets were favourite coats of U.S. girls in 1943

BLACK WOOL PINAFORE, similar to a sleeveless, calf-length, pull-on sweater

SHORT-SKIRTED, décolleté evening dress —a radical departure in 1943 from the evening clothes of the preceding decade

WOOL FLEECE COAT lined in ocelot. The fur-lined greatcoat for all occasions was the most important coat of the fall of 1943 in the United States

had tailored black silk jackets to turn them into modest suits for restaurants and theatres.

The deep oval décolletage with its little cap sleeves proved so becoming to so many women, and such a relief from high-neck, long-sleeve fashions that it spread to clothes of every description . . . dresses of pastel wool, of stiff brown moiré, of soft crepe in black or lively colours. Both the oval and the halter neckline were uppermost also in a new genre of playdress for the south . . . a casual, feminine type of dress, made in coarse colourful cottons from Mexico and Guatemala, that threatened to supplant the shirtwaist dress, to banish the ubiquitous slacks from the beach and relegate them forever to fields in which they have a real function—factories, decks of boats, western plains, backwoods' camps. Federal Bureau of Investigation.

Faced with the greatest responsibilities in its history, the Federal Bureau of Investigation accomplished its greatest results during the fiscal year 1943.

Eight German sabotage agents, fresh from the sabotage schools of Germany, landed on the eastern coast. They were brought near the shore by submarines. Four of them landed near Amagansett, Long Island, N.Y., and the other four landed near Jacksonville, Fla. They were apprehended by the FBI, and after trial before a military tribunal, six received death sentences and the other two were sentenced to life and 30 years, respectively.

During the fiscal year 1943, 10,294 convictions resulted from FBI investigative activity with sentences imposed totalling 7 death, 3 life, 24,624 years, 3 months and 6 days. These figures indicate a marked increase over those of the preceding fiscal year. Of the cases investigated by the FBI which were brought to trial, convictions were obtained in 95.8% of these cases.

During the year 8,367 federal fugitives from justice were located by special agents of the FBI. A total of 11,976 fugitives were located for state, county and municipal law enforcement agencies when their fingerprints were sought through the files of the identification division of the FBI. Fines imposed, savings effected and recoveries resulting from the bureau's work during the fiscal year totalled $29,229,750.91.

Espionage.—There were 28 convictions during the fiscal year for espionage or for failure to register as foreign agents, with the imposition of sentences totalling 255 years.

The counterespionage program of the FBI brought enemy espionage within the United States under control. Liaison established with United Nations intelligence agencies resulted in co-operation on security matters. As a result of work done over the years it was possible in many instances to render negative many enemy agents before they were even able to start their particular assignments.

Sabotage.—During the fiscal year 90 convictions resulted from prosecutions in federal courts in sabotage cases investigated by the FBI. Sentences imposed totalled 6 death, 1 life, 287 years and 6 months, with fines of $31,004. Savings and recoveries in these cases realized $174,940.62.

Although there was a substantial increase in the number of cases of suspected sabotage reported during 1943, there was no evidence of any foreign-directed acts of destruction. In almost all instances the sabotage was committed by individuals acting on their own initiative because of maliciousness, spite or as a prank.

From the inception of the emergency until the end of the fiscal year 1943, a total of 10,371 cases of suspected sabotage were investigated by the FBI. Technical sabotage in some form was found in 943 instances and 466 convictions resulted from prosecutions in state and federal courts. Sentences totalled 6 death, 1 life, 1,051 years, 8 months and 16 days, while fines, savings and recoveries amounted to $216,969.62.

FBI Laboratory.—Closely related to espionage, sabotage and other security matters is the work of the FBI technical laboratory, since many investigations depend a great deal upon the results obtained in the technical laboratory for a successful conclusion of the case. The achievements of the FBI laboratory for the fiscal year ending June 30, 1943, far surpassed those of any prior year. A total of 193,371 examinations involving 247,886 individual specimens of evidence were conducted by laboratory technicians as compared with 51,475 examinations during 1942 and 14,589 during 1941. A great portion of the year's activities was directly concerned with the war effort.

Female technicians came into their own during 1943 in the FBI laboratory as a result of the extreme shortage of male personnel and the necessity of placing every possible male agent in the investigative field. It was necessary to train women in practically every phase of the FBI laboratory's work. Women were found to be particularly adept in document examinations, cryptographic work, photography and spectrographic analyses.

Assistance was rendered to other agencies of the federal government in 532 instances, and the technicians aided state, county and municipal law enforcement agencies in 982 cases. This particular aspect of the FBI's work is made as a co-operative gesture, and all of the work done for other agencies in the laboratory is performed free of charge. FBI technicians testify in state, county and local courts throughout the entire nation each year.

As the fiscal year 1943 ended a total of 14,432 enemy aliens had been apprehended since the outbreak of the war on Dec. 7, 1941, consisting of 5,234 Japanese, 5,685 Germans, 3,490 Italians, 11 Hungarians, 11 Rumanians and 1 Bulgarian. Those not immediately released were held for hearings before the enemy alien hearing board, which makes recommendations to the attorney general as to whether the alien should be interned, released or paroled. With reference to the 14,432 enemy aliens arrested from Dec. 7, 1941, to June 30, 1943, 4,150 were released after submitting convincing proof of their patriotism and explaining their suspicious activities to the satisfaction of the United States attorneys or to the various enemy alien hearing boards; 5,833 were interned; 3,869 paroled; 42 were repatriated; 22 had died; and 516 cases were pending.

Large amounts of prohibited material were seized in searches of the homes of enemy aliens. From the outbreak of the war until the end of the fiscal year, 24,662 premises of enemy aliens were searched for contraband materials by the FBI and co-operating local law enforcement agencies. Some of the items seized were as follows: 4,401 guns of various types, 303,547 rounds of ammunition, 3,125 short-wave radio receiving sets, 15 short-wave radio transmitting sets, 874 other signalling devices, 4,048 cameras, 2,320 sticks of dynamite, 2,828 dynamite caps and 3,787 ft. of dynamite fuse.

Sedition.—During 1943 there were 29 convictions under the sedition statutes, with sentences aggregating 146 years and 1 day. Fines imposed amounted to $17,250. A total of 1,094 cases were investigated by the FBI and as the year ended, 42 individuals and 1 corporation were under indictment awaiting trial.

Selective Training and Service Act.—In the enforcement of the criminal provisions of the Selective Training and Service act the FBI meticulously avoided the policy of making mass arrests and "slacker raids." Each case submitted to the FBI was handled individually, and a substantial portion of the investigations were terminated when compliance with the law was secured. A total of 204,519 cases were closed in matters involving reported violations of the Selective Training and Service act. Convictions for the fiscal year 1943 totalled 3,071, while sentences aggregated 7,542 years, 2 months and 29 days. In addition, fines amounting to $478,001.04 were imposed. Since Oct. 16, 1940, the first registration date, a total of 4,380 convictions have resulted from investigations made by the FBI.

War Frauds.—With the rapidly rising war production a marked increase in the number of cases involving war frauds of various types was noted. Continuous and preferred attention was afforded investigations of this type by the FBI. There were 66 convictions during the year, with sentences of 93 years, 8 months and 2 days and fines, savings and recoveries amounting to $164,484.45. Numerous prosecutions were pending on June 30, 1943.

In the year ending June 30, 1943, the FBI's personnel continued to expand to meet the ever-increasing responsibilities brought on by the war. A total of 390,805 national security matters were reported to the FBI for investigative attention during the fiscal period as compared with 218,734 during the year 1942, 68,368 during 1941, 16,885 during 1940, 1,651 during 1939 and 250 during 1938.

At the request of the war and navy departments special inquiries concerning the loyalty of designated aliens employed on war contracts were conducted by the FBI, and although the responsibility for these inquiries was transferred to the office of the provost marshal general of the war department, name searches on aliens employed on war contracts were being made at the request of the war and navy departments. During the fiscal year 77,472 searches of this type were made through the FBI files.

Federal Bank Robbery Act.—Sixty-one fugitive bank robbers were located, among them several sought for many years. There were 92 convictions in federal courts for bank robbery, larceny and burglary, resulting in total sentences of 725 years, 2 months and 10 days.

From the passage of the Federal Bank Robbery act in 1934 to June 30, 1943, there were 970 bank robberies coming within the jurisdiction of the FBI. Convictions in federal courts totalled 699, with sentences imposed consisting of 2 death, 14 life, 11,384 years, 3 months and 24 days, with fines and recoveries amounting to $351,100.08. Four bank bandits were killed resisting arrest, 3 committed suicide and 1 was adjudged insane. As a result of the FBI's activity in this field, bank robbery declined more than 92% since the peak year 1932.

Extortion.—From the passage of the Federal Extortion act on July 8, 1932, to June 30, 1943, 890 convictions in federal courts resulted from investigations of this character. Sentences totalled 3,775 years, 5 months and 5 days. In addition, 4 extortioners were killed during that period while resisting arrest, 2 others committed suicide and 33 were found insane.

In the fiscal year 1943, there were 71 convictions from prosecutions in federal courts, with sentences totalling 218 years, 10 months and 10 days. Fines of $2,430 were imposed and 22 fugitives from justice were located.

Kidnapping.—During the fiscal year 1943, 29 kidnapping cases occurred and all of these were solved. Forty-seven convictions were obtained as a result of the work of the FBI, with sentences totalling 461 years, 10 months and 3 days. Thirty-four fugitives sought for this violation were located during the year.

From the passage of the Federal Kidnapping act on June 22, 1932, to the close of the fiscal year June 30, 1943, 254 cases of kidnapping and conspiracy to kidnap were investigated by the FBI. Of these, 252 were solved and the remaining two were still under the act of investigation as the year ended. There were 496 convictions in federal and state courts, with

sentences of 5,482 years, 6 months and 20 days, and fines of $34,270.80. In addition, there were 12 death sentences and 44 life sentences. Eight kidnappers were killed during this period while resisting arrest, 7 were murdered by other gang members, 9 committed suicide, 2 were lynched and 1 was declared insane.

Illegal Wearing of Uniform.—Violations of this type increased manyfold during 1943, and 428 convictions with sentences of 385 years, 6 months and 2 days resulted from the investigative efforts of the FBI. Fines of $5,020 were imposed.

National Bank and Federal Reserve Acts.—During the fiscal year 1943, irregularities in national banks, member banks of the federal reserve system and banks insured by the Federal Deposit Insurance corporation exceeding $3,700,000 were reported to the FBI for investigation. A total of 16,924 banks, or 94% of all banking institutions, were covered by the FBI's jurisdiction. Two hundred and twenty-two convictions resulted from prosecutions in federal courts. Sentences imposed totalled 781 years, 8 months and 2 days, while fines and recoveries amounted to $334,514.95. Twenty-six fugitives from justice were located in connection with this particular type of violation.

National Bankruptcy Act.—Twenty-four fugitives from justice were located in cases of this type during the year 1943, while prosecutions for violations of this act resulted in 72 convictions. Sentences totalled 135 years, 9 months and 21 days, while fines of $23,862.79 were imposed and concealed assets valued at $108,894.59 were recovered through investigative activity.

National Motor Vehicle Theft Act.—Since the enactment of this law in 1919 making it a federal offense to transport a stolen vehicle in interstate commerce, 72,106 motor vehicles valued at more than $40,000,000 have been recovered in cases investigated by the FBI through June 30, 1943. During the fiscal year 1943, 5,717 stolen motor vehicles valued at $3,227,120.83 were recovered in cases involving violations of this statute. A total of 2,171 convictions resulted from prosecutions in federal courts, with sentences aggregating 6,410 years, 3 months and 27 days. Fines amounting to $8,671.02 were imposed and 745 fugitives from justice were located.

National Stolen Property Act.—Fifty-three convictions resulted during 1943 in cases involving violations of this statute, which prohibits the interstate transportation of property or money valued at more than $5,000 which has been stolen, embezzled or otherwise taken feloniously. Sentences imposed totalled 261 years, 10 months and 2 days, while fines, savings and recoveries amounted to $25,385. Seventy-three fugitives from justice were located.

Theft, Embezzlement and Illegal Possession of Government Property.—A total of 634 convictions resulted from prosecutions in federal courts during the year 1943. In violations of this type sentences totalled 1,139 years, 2 months and 9 days, while fines, savings and recoveries amounted to $67,099.47. Eighty fugitives from justice were located.

White Slave Traffic Act.—The fiscal year 1943 witnessed a rather substantial increase in convictions under this law, there being 533 successful prosecutions as compared with 384 during the preceding fiscal period. Sentences imposed during the year ending June 30, 1943, totalled 1,510 years, 4 months and 23 days, while fines amounted to $94,252.01. Two hundred $67,099.47. Eighty fugitives from justice were located.

Identification Division.—The fiscal year 1943 witnessed the greatest growth of the identification division in its history, and during this period of time this division rendered its greatest service to law enforcement agencies, the armed services, war industries, other government organizations and law-abiding citizens. The identification of mangled bodies in aeroplane crashes, drowned seamen washed ashore and victims of other catastrophes demonstrated the infallibility of fingerprinting as a means of identification.

At the end of the fiscal year June 30, 1943, there were 69,644,540 fingerprint cards on file in the FBI's identification division, an increase of 26,770,462 over the total in file on June 30, 1942. During the year an average of 93,540 sets of fingerprint cards were received each day, and this rapid expansion of the FBI fingerprint files made it necessary to transfer the entire identification division from the department of justice building to larger quarters in the National Guard armory in Washington, D.C.

The value of the civil section of the identification division to law-abiding citizens was increasingly recognized during the year. As of June 30, 1943, 4,943,645 personal identification cards were on file, an increase of 1,819,374 over the total on file one year before.

The record number of 11,976 fugitives was identified during the year by searching incoming arrest cards through the fingerprint files. As the year ended, wanted notices on 58,114 fugitives, including 8,691 parole violators and 1,030 probation violators, were posted in the fingerprint files of the identification division.

More than 20,000,000 fingerprint cards representing applicants in war industries were submitted during the fiscal year. The percentage of identifications of this type of fingerprint card was 5.35, and criminal records located were made available only to the armed services. In many instances individuals seeking positions of trust and responsibility were identified with prior criminal activity making them unfit for the places sought.

Despite the war 42 foreign countries and territorial possessions of the United States co-operated in the international exchange of fingerprint cards in the fiscal year 1943. A total of 1,325 fingerprint cards was transmitted to other countries in international exchange and these resulted in 125 identifications by the end of the fiscal year. A total of 177,326 sets of fingerprints was submitted to the FBI during this period; of these, 15,751 were identified through the files of the FBI.

National Police Academy.—Three sessions of the FBI National Police academy were held during the year and 113 police officers from various parts of the country and Canada were added to the list of graduates, totalling 740 at the end of 1943.

Uniform Crime Reporting.—Monthly crime reports received during the calendar years of 1941 and 1942 from the police in over 2,100 cities having a combined population exceeding 65,000,000 made possible the preparation of various crime statistics which are of inestimable value to law enforcement agencies and public officials throughout the United States.

Juvenile Delinquency.—These statistics reflected that significant and substantial increases were registered in the field of juvenile delinquency during the year, and arrests of girls under voting age increased from 9,675 in 1941 to 15,068 in 1942, or 55.7%. Arrests of girls under 21 for prostitution and commercialized vice showed a 64.8% increase, while for other sex offenses during the same period there was an upswing of 104.7%. Arrests for vagrancy increased 124.3%, while drunkenness and disorderly conduct registered increases of 39.9% and 69.6% respectively. These figures are based on the calendar year 1942 in comparison with the calendar year 1941.

Arrests for rape increased 10.6%, while disorderly conduct and drunkenness among boys under 21 increased 26.2% and 30.3% respectively, according to the arrest records of the calendar year 1942 over those arrested during the calendar year 1941. (*See* also CHILD WELFARE; CRIME; KIDNAPPING; POLICE; SECRET SERVICE.) (J. E. H.)

Federal Communications Commission.

The agency of the United States government charged with regulation of interstate communications by wire and radio devoted an increasing proportion of its time during 1943 to communications problems arising out of war.

At the end of 1943 the FCC's Foreign Broadcast Intelligence service—which was set up to monitor foreign broadcasts and relay significant items to government war agencies as an aid in countering enemy propaganda and mapping foreign policy—was surveying 2,500,000 words a day of foreign broadcast material in 35 languages and dialects. Co-operative arrangements were completed with the Office of War Information, British Ministry of Information, British Broadcasting corporation and listening posts of other friendly nations for coverage and transmission to FBIS of broadcasts not well heard in the United States.

An important war service was performed by the Radio Intelligence division in maintaining a round-the-clock patrol of the spectrum to guard against illegal or enemy radio transmissions, trace sources of interference to military and commercial radio broadcasts, and through radio direction-finding equipment assist ships and planes in distress. RID investigated 3,960 cases of illegal radio operation during the fiscal year 1942–43.

To conserve broadcast equipment without impairing quality of service, the FCC in Nov. 1942 required readjustments of broadcast transmitters, decreasing radiated power by one decibel. A voluntary reduction in time of operation of standard broadcast station from 12 hr., in the case of unlimited time stations, to 6 hr. a day was authorized. In Aug. 1943, the commission announced it would authorize civilian construction involving the use of idle equipment to increase power of 100-watt local channel standard broadcast stations to 250 watts and for new local channel stations in communities where no station was located (excluding communities within metropolitan areas with radio service). Multiple ownership of standard broadcast stations serving substantially the same area was banned (Nov. 1943) and in December the licence periods of standard stations were extended from two to three years, maximum statutory limit.

The largest telephone rate investigation of the year ended Jan. 1943 when the FCC announced that the American Telephone & Telegraph Co. Long Lines department had agreed to overall rate reductions to the public (in overtime charges on toll calls, and in rates charged for private line telephone and telegraph and radio program transmission) totalling about $34,700,000 annually.

Another important development was the merger of Western Union and Postal Telegraph, Inc., the two major domestic competing telegraph carriers—authorized in permissive legislation by congress in March 1943 and approved by the FCC Sept. 27, 1943.

The supreme court handed down two significant decisions in the radio field: *National Broadcasting Company* v. *United States* and the *Columbia Broadcasting System* v. *United States*, both of which were decided in favour of the FCC (May 10, 1943) and its chain broadcasting regulations, designed to foster competition in network broadcasting and expand the listening opportunities of radio audiences. In *Federal Communications Commission* v.

National Broadcasting Company (KOA) the supreme court (May 17, 1943) affirmed the district court of appeals' decision favouring KOA, holding that a Class I radio station has a right to intervene in proceedings on an application which involves the nighttime operation of another station on the channel already occupied by the Class I licensee.

During the year two bills were introduced, one in the senate (S. 814) and one in the house (H.R. 1490) to amend the Communications act of 1934, under which the FCC was established. Hearings on the senate bill were held in Nov. and Dec. 1943.

No hearings had been called on the house bill at the end of the year.

Members of the commission in 1943 were James Lawrence Fly, chairman; Paul A. Walker, Norman S. Case, T. A. M. Craven, Ray C. Wakefield and Clifford J. Durr. There was one vacancy. (*See* also RADIO; WAR COMMUNICATIONS, BOARD OF.)

(J. L. Fy.)

Federal Council of the Churches of Christ in America.

In 1943 the council consisted of 25 national denominations. The member denominations included most of the major Protestant bodies and two churches of the eastern Catholic group (the Syrian Orthodox and the Ukrainian Orthodox).

The total membership of the constituent denominations in 1943 was 25,551,560 with local congregations of more than 140.000.

Through the general commission on army and navy chaplains the recruiting of Protestant ministers for religious work in the army and navy was carried on. The chairman of the commission, Dr. William B. Pugh, made a visitation to the chaplains in all the overseas theatres of military operations. Through the Christian commission for camp and defense communities guidance was given to local churches facing new responsibilities because of their proximity to camps or wartime communities. A program for securing the co-operation of local churches in the resettlement of Japanese Americans as they were released from the government camps was developed to the point at which assistance had been given in the relocation of 17,000. The committee on foreign relief appeals continued its work in co-ordinating the work of the churches in securing support for refugees, prisoners of war, China relief, missionaries cut off from their normal bases of support and other wartime works of mercy. A new committee on overseas relief and reconstruction began plans for assistance to European churches after the war.

The commission on a just and durable peace promulgated a platform for postwar reconstruction known as "Six Pillars of Peace."

The commission also conducted regional conferences in 100 different cities in the month of November. A new commission on the church and minority peoples began its work of making a co-operative approach to racial problems in the light of the experience of the war.

A plan for uniting the federal council and seven interdenominational agencies working in more specialized fields, such as the Foreign Missions Conference of North America and the Home Missions Council of North America, was carried further toward completion.

The council continued its work in the fields of evangelism, worship, family life and social service. A major feature was the holding of "Christian Missions," each a week in duration, in military and naval camps.

Ten religious programs over national radio networks were presented each week throughout the year. The *Federal Council Bulletin* (monthly) and *Information Service* (weekly) continued to be published. (S. McC. C.)

Federal Deposit Insurance Corporation.

During the year 1943 the beneficial effects of the protection and influence of the Federal Deposit Insurance corporation, with regard to banking institutions as well as depositors, continued to be manifested in ever-growing soundness of banking in general and also in vast increases in savings by the people.

Capital and surplus of the insurance corporation increased about $100,000,000 during 1943, standing at $700,000,000 at the end of the year, or nearly two and one-half times the amount of capital available at the beginning of its operations in 1933. During 1943 only five insured banks were closed or merged with financial assistance from FDIC, affecting about 50,000 depositors with total deposits of less than $10.000.000. This was the smallest number of bank closings recorded in any calendar year during the ten years of FDIC operation.

Outlays in 1943 on account of banks in difficulties were $7.000,000, about 80% of which was recoverable.

Fewer than one-fifth of 1% of depositors in participating banks held accounts in excess of $5,000, the maximum amount fully covered by federal insurance. As of Dec. 31, 1943, deposits of insured banks amounted to $113,000,000,000 and their total assets were $122,000,000,000. Three-fourths of the assets were in United States government obligations, cash, and balance with other banks included in the federal reserve system. Of the remaining assets, only 5% were criticized in 1943 by federal bank examiners. Assessments during the year exceeded $70,000,000, and income from investments approximated $14,000,000.

The only legislation in 1943 directly affecting FDIC was an act passed April 13, permitting the deduction of war loan accounts from total deposit liabilities in calculating the base for FDIC assessments. (*See* also BANKING.) (C. A. Sr.)

Federal Power Commission.

The most important of the court cases in 1943 was the decision of the supreme court of the United States in the case of *Federal Power Commission* v. *Hope Natural Gas Company*, upholding an order of the commission for a reduction in rates based upon the "actual legitimate cost" of, or "prudent investment" in, the company's property as a rate base. This decision taken in conjunction with the previous opinion in the case of *Federal Power Commission* v. *Natural Gas Pipeline Company* was generally considered to inaugurate a new era in public utility rate making for both federal and state regulatory authorities, by establishing "actual legitimate cost" or "prudent investment" as a basis for rate making and discarding the so-called "fair value" rule of *Smyth* v. *Ames* (decided in 1898) which prescribed a complex set of factors, including "reproduction cost," for determination of a rate base.

Other notable court cases sustaining the commission included the decision upholding the commission's determination of the actual legitimate original cost of the Niagara Falls Power company project 16, located near Niagara Falls, N.Y., as $27,910.538.73, disallowing claimed project costs amounting to $16.543,329.95. This, beside deciding important questions relative to the commission's authority, marked the end of a controversy covering a period of 20 years. In a series of decisions during the year the courts also upheld other orders of the commission de-

termining the actual legitimate original cost of other projects licensed under part I of the Federal Power act and the charging off of write-ups and other inflationary items.

The courts also upheld similar action of the commission in reclassifying the accounts of public utilities under part II of the Federal Power act and of natural gas companies under the Natural Gas act, sustaining comprehensive authority in the commission over the accounts of public utilities and natural gas companies.

The war activities of the commission during 1943 included continued co-operation with the War Production board in the handling of power and gas problems relating to the war; the collection and analysis of power statistics related to the war for all federal agencies; supervision of a nation-wide electric and gas plant protection program in co-operation with the war department; the negotiation, in co-operation with federal procurement agencies, of war power contracts with a view to assuring government a supply of power for its war activities at reasonable rates; and the ordering of temporary emergency interconnections for war purposes. The commission in 1943 also passed upon applications for certificates of public convenience and necessity for a wide range of additional natural gas pipe line facilities used in war production, both major long-distance pipe lines and shorter connections. The largest natural gas pipe line authorized by the commission was planned to extend approximately 1,200 mi. from Texas to West Virginia. Another natural gas pipe line of major importance, authorized by the commission, was to extend a distance of 237 mi. from Oklahoma to the mid-continent area.

The commission also was active in rate cases, particularly natural gas cases, and by the end of 1943 had ordered rate reductions aggregating nearly $35,000,000 per year in wholesale rates. Nearly $10,000,000 in rate reductions for natural gas were effected without formal hearings, following conferences with company representatives, and, in some cases, without either hearing or field investigation. (L. O.)

Federal Public Housing Authority: *see* NATIONAL HOUSING AGENCY.

Federal Reserve System.

The burden of expediting the financing of war activities not only of the United States but to a considerable degree those of allied nations—and at the same time maintaining a stiff resistance to the inflationary repercussions of such prodigal expenditures as incurred in total war—taxed the resourcefulness of the federal reserve system of the United States in 1943. The inflationary potential was apparent in the fact that the monetary cost of the United Nations' war effort to the end of 1943, estimated at $450,000,000,000, was more than three times the total amount spent by the Allied powers during the entire World War I. Nevertheless, the restrictive measures enforced in the United States kept the nation's economy on a fairly even keel.

In an effort to reduce the proportion of new federal debt absorbed by the banking system, and thereby relieve the inflationary pressure exerted by bank deposits created by holdings of government securities, sales to commercial banks were limited to $5,000,000,000 in the Second War Loan drive of April 1943, and to $3,200,000,000 after the conclusion of the Third War Loan drive in October. During the year the banking system absorbed approximately 45% of the total increase in the interest-bearing and guaranteed debt of the United States, this increase amounting to nearly $60,000,000,000. This was regarded as a more favourable showing than in 1942, when the banks purchased one-half of all new government obligations.

The federal reserve system aided the treasury in its efforts to borrow directly from the people the largest possible sums of money, but since it continued to be necessary also to borrow from the banks, the system took further steps to assure adequate reserves to permit bank purchases of all securities not sold elsewhere. This was accomplished through purchases by the reserve banks in the open market and directly from banks short of reserves, at a rate of $\frac{3}{8}$ of 1%, with a repurchase option available to sellers, in continuation of a policy formulated in 1942 by the Federal Open Market committee. Federal reserve banks increased their holdings of government securities in 1943 by approximately $5,000,000,000, mostly in relatively short-term issues. Bank holdings of long-term securities declined. Also instrumental in maintaining excess reserves was an amendment in April to the Federal Reserve act, suspending the requirement that member banks hold reserves against treasury balances arising as a result of subscriptions for government securities.

Under operation of Reserve Board Regulation V, issued in 1942 to permit the war and navy departments and maritime commission to guarantee loans made to expedite war production, total V loans outstanding on Sept. 30, 1943, amounted to $1,708,000,000, of which $1,413,000,000 was guaranteed. A broadened program for granting VT loans was announced in September, designed to provide contractors additional funds as a means of freeing their working capital invested in war production in the event of contract terminations.

Bank deposits in the United States reached a total of approximately $105,000,000,000 by the end of 1943, compared with $85,800,000,000 on Dec. 31, 1942. While a large portion of the accumulation of demand deposits was in business holdings, the bulk was in cash holdings of individuals, who held the major portion of currency outside the banks and the $32,000,000,000 of time deposits in commercial and savings banks. The alarming increase in currency in circulation that had characterized the two or three years preceding 1943 continued at a rate that brought the total to more than $20,000,000,000 by the end of the year, compared with $11,200,000,000 on Dec. 31, 1941. With national income, employment and industrial production at all-time high levels, it was regarded as probable that a large portion of the increase in money in circulation was attributable to the rapidly expanding wage and salary payments and other transaction needs. The existence of currency "hoarding" was conceded, however, as a natural concomitant of vastly larger incomes of the lower and middle-income groups, which are historically not inclined to patronize banks. Other contributing factors to the preference for currency over deposits were believed to be wartime population shifts and bank service charges.

Due to the policy of regulating consumer credit, the total amount of such credit outstanding in the second half of 1943 was $4,750,000,000, about one-half the peak of $9,500,000,000 outstanding in 1941.

Steadily rising currency demands and an increasing tendency on the part of banks to invest their reserves more fully, were influential factors in the continued decline of excess reserves of member banks. From a peak of $7,000,000,000 at the beginning of 1941, excess reserves declined to about $2,000,000,000 by the first of 1943, and in the later months of the year were hovering around $1,000,000,000. Also contributing to the decrease in excess bank reserves was the $700,000,000 decline early in 1943 in the monetary gold stock, which had remained steady at $22,750,000,000 since 1941. As in 1942, the heaviest drains on bank reserves were felt in New York, where the treasury continued to raise more funds by borrowing and taxes than it spent, resulting in a net outflow to other parts of the country.

Commercial loans, which had continued their 1942 decline through the first half of 1943, rose rapidly in the autumn and regained about one-half their losses of the previous year. Loans

for purchasing and carrying securities increased slightly in 1943.

The board of governors in 1943 was composed of Marriner S. Eccles, chairman; Ronald Ransom, vice-chairman; M. S. Szymczak, John K. McKee, Ernest G. Draper and R. M. Evans. (*See* also BANKING; CONSUMER CREDIT.)

Federal Savings and Loan Insurance Corporation: *see* NATIONAL HOUSING AGENCY.

Federal Security Agency.

The purpose of the U.S. Federal Security agency, as stated in the authorization under which it was established in 1939, is "to promote social and economic security, educational opportunity and the health of the citizens of the Nation." To that end, and in the interests of efficient and effective public service, it administers a broad range of related programs in these fields. Its constituent units are: the Social Security board, the public health service, the Food and Drug administration, the office of education, the office of vocational rehabilitation and St. Elizabeth's hospital. The Civilian Conservation corps and the National Youth administration, two former units whose activities were terminated by congressional action, were under liquidation during the year 1943 and their facilities transferred to other war agencies, particularly the war department. The Federal Security agency also represents the federal government's interest in Howard university, the Columbia Institution for the Deaf and the American Printing House for the Blind.

Over-all correlation of activities and programs throughout the agency is carried on through the office of the administrator, which includes, in addition to the administrative officers, a committee on physical fitness and the office of community war services.

The agency and its constituent units, during the year 1943, carried on many activities arising from and directly connected with the war, along with their continuing responsibilities. The public health service carried on special health protection, disease control and research programs directed toward maintaining conditions conducive to health for the armed forces and civilian workers.

The office of education helped the educational institutions and groups of the country adapt their programs to war needs. It administered the training of thousands for jobs in war industry and assisted the war and navy departments in setting up training courses for the military services.

War production greatly increased the number of persons in jobs covered under the Social Security act, both for old-age and survivors insurance and unemployment compensation. For the same reason, the number of persons on state-federal public assistance rolls decreased. In addition to these continuing programs, the Social Security board was responsible for administering emergency programs for civilian war benefits, civilian war assistance and aid to enemy aliens and others affected by restrictive government action.

The Food and Drug administration intensified its efforts to maintain the integrity of the nation's food and drug supply in the face of wartime factors, such as rapidly increased production, restriction of transportation and shortage of materials and skilled employees, which endanger this supply. At the request of the military services, food and drugs purchased for the U.S. armed forces and for the Allies also were inspected and tested by the Food and Drug administration.

An office of vocational rehabilitation was created to discharge the federal responsibility in connection with the vocational rehabilitation amendments of 1943. These amendments provided the necessary framework within which a peacetime as well as a wartime program of rehabilitation would be administered. The scope of services available to disabled persons under this federal-state program was broadened to include any services necessary to render them capable of engaging in remunerative employment or to render them more advantageously employable. Sole responsibility for the administration, supervision and control of this program rested with the state boards of vocational education. Responsibility for certification of federal funds and establishing standards rested with the Federal Security agency.

The office of community war services operated as the war arm of the Federal Security agency. Because of the close relationship between the emergency needs for health, welfare, recreation, education and related services and the continuing programs of the Federal Security agency this office was given the task of bringing into common action the services of interested federal-state and local public and private agencies, to help states and communities meet these needs. For recreation, social protection and, during a limited period, for services to children of working mothers, fields where national war programs were needed, the office of community war services assumed direct responsibility. Through these programs it helped hard-pressed communities in war areas to develop effective local services. (P. V. M.)

Federal Trade Commission.

The Federal Trade commission in 1943 conducted numerous special investigations and studies in support of the U.S. war effort as well as administering the laws under its jurisdiction, namely, the Federal Trade Commission act, certain sections of the Clayton act, the Wool Products Labeling act, and the Export Trade act.

Designated by the War Production board to investigate compliance by industries with the board's orders relative to the allocation of the supply and the priorities of delivery of critical war materials, the commission conducted such inquiries in the glycerine, capital equipment, electric lamp, electric fuse, silverware, costume jewellery, cotton textile, and paint, varnish and lacquer industries.

Other investigations undertaken for government war agencies, including the Office of Price Administration and the Office of Economic Stabilization, related to (1) costs, prices and profits in the bread-baking, flour-milling, biscuit and cracker, steel-producing and fertilizer industries; (2) methods and costs of distributing principal consumer commodities, including food, wearing apparel, carpets, building materials, petroleum products, automobiles, tires and tubes and electrical household appliances; and (3) 1940 financial operations of 86 industrial corporation groups. The reports on studies of costs, prices and profits provided the government with factual background for its price stabilization functions.

In connection with its work of surveying radio and periodical advertising, the commission analyzed for and reported to various war agencies such advertisements as contained pertinent references to war production, price rises and trends, rationing, priorities and other war-related subjects. Advertisements found to contain possible violations of the Office of Censorship's wartime codes of practices for the press and radio were transferred to that agency for appropriate action.

During the year the commission issued 224 formal complaints alleging violations of the laws administered by it, entered 132 orders to cease and desist from such violations, and accepted 279 stipulations to discontinue unlawful practices. These legal proceedings were directed to promoting free and fair competition in interstate trade in the interest of the public through the prevention of price-fixing agreements, restraint-of-trade combinations, boycotts, unlawful price discriminations, and other unfair methods of competition and unfair or deceptive acts or practices, and to safeguarding the health of the consuming public by preventing

the dissemination of false advertisements of food, drugs, devices and cosmetics which might be injurious to health.

The commission also administered fair trade practice rules for more than 150 industries. (G. S. F.)

Federal Works Agency. In 1943 virtually all activities of the Federal Works agency and its constituent administrations, including the Public Roads administration and the Public Buildings administration, were devoted to the war effort.

Communities which had experienced abnormal population increases because of war activities and which were financially unable to meet the exigencies thus created, were assisted in building, and in some instances in maintaining and operating, such facilities as schools, hospitals, water systems and sewage disposal systems, and in providing additional police and fire protection. War nurseries and child care centres were established in cooperation with local agencies for the care of children of working mothers. Recreation centres were provided for servicemen. Roads were constructed where necessary to the war effort.

As of June 30, 1943, the president had approved 2,480 construction projects with an estimated cost of $322,770,915, under Title II of the Lanham act. Contracts had been awarded for 2,049 projects, construction had been substantially completed on 1,339, and 1,262 were entirely completed. As of the same date 1,027 war public service projects had been initiated to cost $25,463,574. On Nov. 24, 1943, approximately 58,000 children of working mothers were enrolled in 1,915 war nurseries and child care centres operated with Federal Works agency assistance.

The Public Roads administration completed, at a cost of $274,701,799 (of which 72% was furnished by the government), 8,445 mi. of highways of all classes and eliminated 187 highway-railroad grade crossings. The road mileage completed included 2,836 mi. of access roads to war industries and military and naval establishments. Practically all the projects completed were urgently needed in the war effort in 1943. The administration continued its part of the construction of the Alaska highway and of the Inter-American highway. More than a score of flight strips were completed to provide emergency landing and take-off facilities for military aircraft.

The Public Buildings administration, under assignment from the Federal Public Housing authority, erected and managed 16 buildings at four separate residence hall projects in or near the District of Columbia, having accommodations for 9,000 women employees of the federal government and personnel of the WAVES. The administration also handled the maintenance, repair, alteration, improvement and preservation of more than 3,500 buildings throughout the United States; directed wartime emergency measures to protect government buildings and other property against sabotage and enemy attack; and handled the decentralization of numerous government agencies from crowded Washington to other cities.

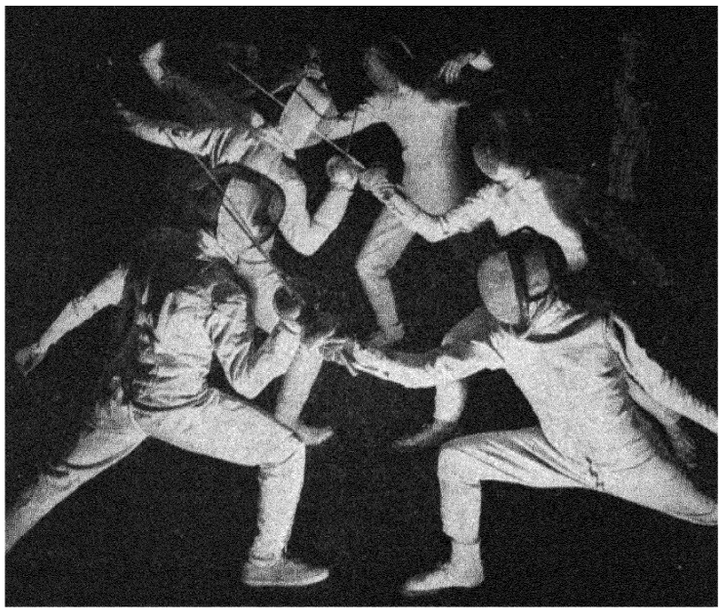
The Work Projects administration, which since its establishment in 1935 had provided jobs for more than 8,500,000 citizens, passed out of existence June 30, 1943, under an executive order issued Dec. 4, 1942. Projects throughout the country were terminated as quickly as possible and there reverted to the treasury in excess of $106,000,000 of WPA's final appropriation. Details of liquidation carrying over after June 30 were left to FWA.

The Public Works administration proceeded with its liquidation under the direction of the Federal Works administrator. Grand River dam, in Oklahoma, completed as a PWA project, was transferred by executive order to the jurisdiction of the secretary of the interior. (*See* also NATIONAL HOUSING AGENCY.) (P. B. F.)

Federated Malay States. One of the three principal administrative divisions of British Malaya, the other two being the Straits Settlements and the Unfederated Malay States (*qq.v.*). There are four of the Federated States—Perak, Selangor, Negri Sembilan and Pahang, of which the first three are on the west coast of the Malay peninsula, while Pahang is on the east coast. Area, 27,540 sq.mi.; pop. (est. 1941) 2,193,605, distributed as follows: Perak, 984,464; Selangor, 696,173; Negri Sembilan, 293,510; Pahang, 219,458. The capital and largest city is Kuala Lumpur (Selangor), pop. (1939) 138,425. Racially the population was divided as follows (est. 1941): Europeans, 11,019; Eurasians, 5,226; Malays, 713,679; Chinese, 978,208; Indians, 468,029; others, 17,444.

Before the Japanese occupation in 1941–42 the nominal ruler of each state was a native sultan, who received political advice from a British resident, himself under the authority of the high commissioner, who was also governor of the Straits Settlements. This joint office, until the Japanese invasion, was held by Sir Thomas Shenton Whitelegge Thomas (appointed in 1934). Information about conditions in the states after the Japanese occupation was scanty; but it seems that the sultans remained in their old capacity as nominal rulers, taking "advice" from Japanese military officers. Malaya was included in the Japanese idea of "Greater East Asia" and was combed for raw materials useful to the Japanese war effort, notably rubber, tin and iron.

Education.—Expenditure on education in 1940 was £437,796. There were 35 English schools for boys (13,564 pupils) and 14 English schools for girls (5,941 pupils). There were 582 Malay schools (63,638 pupils) and 572 Chinese schools (58,227 pupils). There were 580 schools in Tamil (the Indian dialect spoken by many Indians in Malaya), with 23,527 pupils.



Finance.—Revenue in 1940 was £11,493,060, expenditure was £9,166,303. Public debt at the end of 1940 was £9,950,000.

Agriculture and Mineral Production.—Rubber and tin are the most important products of the Federated Malay States. There were 1,699,459 ac. of rubber plantations in 1940, 251,960 ac. in coco-nut groves, 186,310 ac. in rice-paddies, 40,629 ac. of oil-bearing palms. Mineral production in that year was as follows: tin 35,689 tons; gold 81,633 oz.; tungsten 90 tons; coal 781,508 tons. There were 90,145 miners, mostly Chinese, while the labourers on rubber plantations were mostly Indians. (*See* also JAPAN.) (W. H. CH.)

Federation of Labor, American: *see* AMERICAN FEDERATION OF LABOR.

Feldspar. Sales of feldspar in the United States declined from 338,860 long tons in 1941 to 307,823 tons in 1942, largely because of decreased use in enamel and porcelain coatings on steel. Consumption in plate glass declined, but this was more than offset by increased demand for glass containers. Canadian production was 20,288 short tons in 1942, as compared with 26,040 tons in 1941. Production through August 1943 was 15% of the same period of 1942. (G. A. RO.)

Fencing. In spite of a greatly curtailed schedule in all sections of the United States most of the older established fencing groups carried on with better than average results. The National Collegiate A.A. championships and the Mid-West Division championships of the Amateur Fencers League of America were omitted in 1943. Much emphasis was placed on the national championships. In the foil Warren Dow of the New York Athletic club again placed first with Alfred Snyder (Salle Santelli) and Robert Kaplan (N.Y. university) second and third respectively. In the épée Robert Driscoll (Fencers' club), Greg-
